The standard deviation and varation coeffiecients have higher oscillations in the first period compared with the second one, and regarding the average significance, it was noticed that for Bucharest-Ilfov region $t_{cal} = 4,83 > t_{teor} = 3.76$ its value is very significant , proving the productions homogeneity in the second period. The reason for this homogeneity is not so joyful, because the small constant productions from the las years tot are due to small acreage, a big part of the arable land transformed its destionation into industrial or for constructions land.

2. Statistical indicators of cereals cultivated surfaces at country level and by Development Regions

Regarding the statistical indicators of the cultivated surface with cereals, were analyzed the same two periods, as for total productions 1990-2006 and 2007-2014.

In the first analyzed period (table 4) the surfaces cultivated with cereals at the country level decreased by 10.3% in 2006 compared to 1990.

Table 4 The total cereals surface evolution at the country level and by Development for the period 1990-2006

On Development Regions it is observed a decrease of the surface , the most significant decreases are for Bucharest-Ilfov Region with 30.3% , North-East Region with 21.2% and Central Region with 20.3%.
An increase of the surfaces cultivated with cereals we can see in the South-West Oltenia Region with 3.9% in year 2006 compared with year 1990.

Source: Own calculation based on data from INSSE and Romania Statistical Yearbook, series of time

In the second analyzed period (table 5), can be observed increases of the surfaces , in year 2014 compared to 2007, at country level with 6.1%, and by Development Regions, West with 22.7%. South-east with 20.7%, South-Muntenia with 9.3% and South-West Oltenia with 2%. In the other regions it is maintained the decrease tendency from the first period.
Comparing the two analyzed periods,1990-2006 and 2007-2014 respectively, we observe that deviations averages for the two periods are very significant in the most of the regions, and also at the country level, t_{cal} having a higher value then $t_{teor.}$
Also, it is observed a smaller variation coefficient in the second period that demonstrates a lower oscillation of data, in the most of regions and at country level, excepting Bucharest-Ilfov region where the variation coefficient has increased in the second period with 7.69%. Besides, this region has suffered an important reduction of surfaces, many land changing their land use.

3. Statistical indicators of cereals average productions at country level and by Development Regions
Our analysis is continued by determining the average production evolution for period 1990-2006 also for years 2007-2014.
In the period 1990-2006,(table 7) were noticed increases of productions at the country level with 2.4% in 2006 compared with the first year, and on development regions , significant increases we can observe in West with 23.7%, North-West with 21.7% and South-East with 17.7%. The regions that had a decrease of average productions is South-Muntenia Region and South-Oltenia Region, with approx. -16% in 2006 compared to 1990.

An explanation for the decrease of the average productions in this region , is the unpredictable character of the climate conditions, and for increasing the productions the specialists recommend that in order of the exploitation size to be cultivated at least 3-5 variety of wheat or other cereal. With different reaction to the environment. Also, they highlight that it must be taken into account that between the grains productions and the grains content in protein it's a negative correlation (Racz,2013). For example, at the wheat culture, the plants productivity is dependent of the hereditary factor, on which in the phenotypic express a major role have the environment conditions, as the interaction genotype – environment (Knežević, 2008).

In the second period under analyze, the average productions are increasing, thus, at the country level form 1.52 to/ha in 2007 reaches at 4.05 to/ha in year 2014, and on Development Regions the most important increases are in Bucharest-Ilfov Region from 0.92 to/ha in 2007 at 1.37 to/ha and South-West Oltenia from 0.83 to/ha at 3.56 to/ha.
Comparing the two periods analyzed , as we can see in table 9, the second period has annual growth rhythms significant bigger that the first period.

The deviations of the two period's averages turned to be significant for the regions North-west, Center and West. The variations on years between productions are big, the calculated coefficients demonstrate that have increased in the second period the oscillations between productions on years, due to the lack of an organized agriculture, lack of irrigation in the most part of arable land. If at the 1990's level there were around 3 million hectares that had irrigations, the surfaces have decreased dramatically, gathering at the period's end a surface around 10% from the initial surface to beneficiate of irrigation. There are rehabilitations projects for the irrigations system and as the representatives of Ministry of Agriculture sustain, the infrastructure for irrigation has a chance to be rehabilitated until 2020.

4. Statistical trend indicators of cereals production at country level and by Development Regions

Next were calculated the trend line equations on total productions, cultivated surfaces and average productions, equations that helped to extrapolate the productions until year 2020. The calculated equations were second and third degree polynomial equations, the tendency being illustrated in the figures that complete the tables.

At the country level for the period 1990-2014 it is registered an average of total production of 16,806 thousand tonnes, with a standard deviation of productions for the entire period of 783.3 thousand tonnes, the variation coefficient demonstrating a small variation , 4.7%(table 10). The equation coefficients for the production at the country level are $Y= 18.236-401x+17.12x^2$, the next table (table11) is illustrating the adjusted productions for the whole period for the country level and also for the regions. There were calculated equations coefficients for all Development Regions, the equation turning to be very significant for the Regions North-West, Centre, North-East and Bucharest-Ilfov.

Source: Own calculation based on data from INSSE and Romania Statistical Yearbook, series of time
* Ptaj= total adjusted production; tp= transgression probability; Th. To= Thousand tonnes

In the table no. 11 were calculated the total adjusted productions for the period 1990-2014 and also the tendency extrapolation until 2020. To these calculations were added the confidence limits for a given probability (95%), with a transgression probability of 2.711 (23 freedom degrees) and a significance threshold of 0.05%. As it can be observed from the table and figure 1 , the productions tendency at the national level is to increase , the year 2020 could bring a total cereal production of 22,256 thousand tonnes, production ranging between 20,916 thousand tonnes lower limit and 23596 thousand tonnes upper limit, as it resulted from the confidence interval calculation.
Regarding the Development Regions , the trend is to increase in the North-East Regions 2,730 thousand tonnes respectively in the year 2020, 4,934 thousand tonnes in the South-East Region, Sout-Muntenia with an important increase, ie 6,701 thousand tonnes in 2020 and West Region with a slight increase up to 2,464 thousand tonnes in the same year(Figures 2-4).

According the extrapolations we can see decreases until the period final for the Regions North-West and Centre and small fluctuations for Bucharest-Ilfov and South-West Oltenia Regions.

4.2.Statistical trend indicators of cereals cultivated surfaces

Tables 12 and 13 and also figures 5-8 present the analysis on the calculated equation for the cultivated surfaces with cereals and their tendency for the period 2015-2020.

Table 12. The trend line equation coefficients for the total cereals surface at the country level and for Development Regions

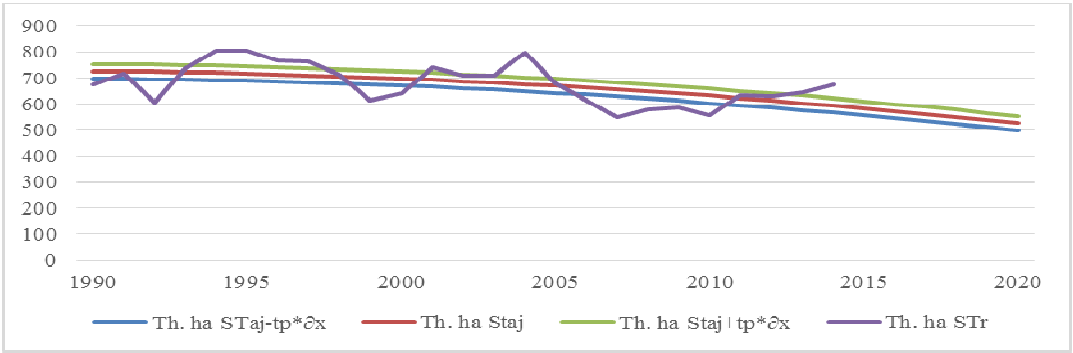
Figure 7 Graphical representation of the total cereal surface, surfaces equation calculated for the period 1990-2014 and surfaces extrapolation by 2015-2020 for the Bucharest –Ilfov Region



*Staj= adjusted surface, th. Ha= thousand hectares, tp= transgression probability

Figure 8. Graphical representation of the total cereal surface, surfaces equation calculated for the period 1990-2014 and surfaces extrapolation by 2015-2020 for the West Region

Data from table 13 aren't presenting a very happy situation for the surfaces cultivated with cereals , on the contrary, also nationally as on regions we have decrease tendency.

Thus, the surface at national level, has a continuous drop until 2020, at 4,666 Th. Ha, dramatic decreases also in the other regions, excepting the South-East Region that has a small increase and South-Muntenia with almost the same surface.

The confidence intervals were calculated for a tp =1.711, and a significance threshold of 0.05% The results showed very close limits with the extrapolation.

Table 13. The cereals surfaces tendency, for the period 2015-2020, nationwide and by regions

4.3. Statistical trend indicators of cereals average productions

The trend line indicators calculation finalizes with the average production for the same periods as the past indicators.

In table 14 we see the calculation coefficients of the second degree equation, equation that resulted to be very significant for the North-West, Centre, North-East and West Regions.

Table 14. The trend line equation coefficients for the average cereals production at the country level and on Development Regions.

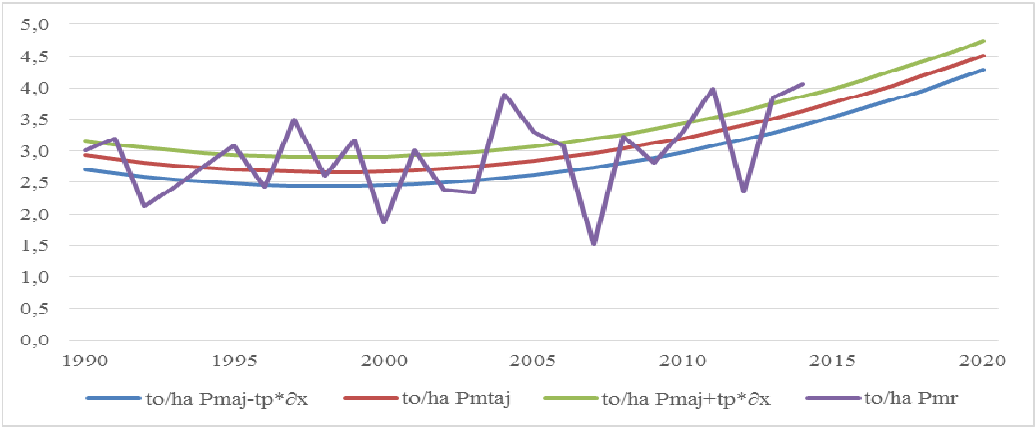
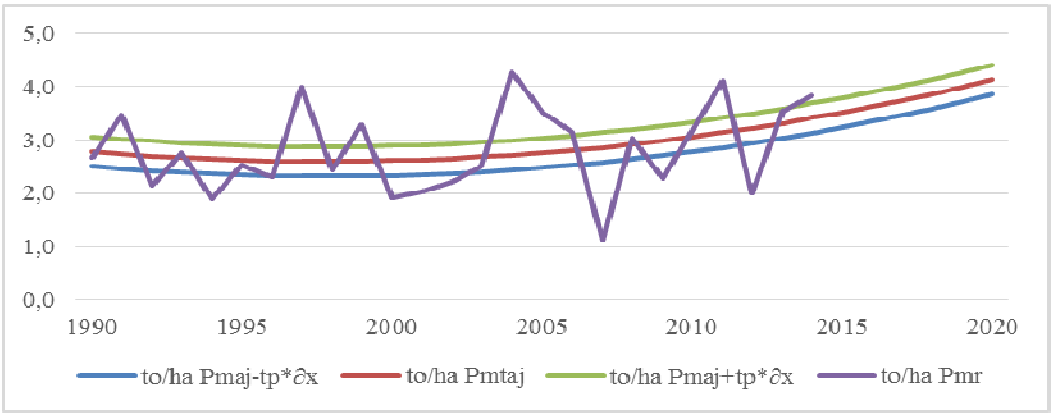
As it can be observed from table 15 and figures 9-12, the tendency for all regions is of increase, the figure exemplifying the higher increase.



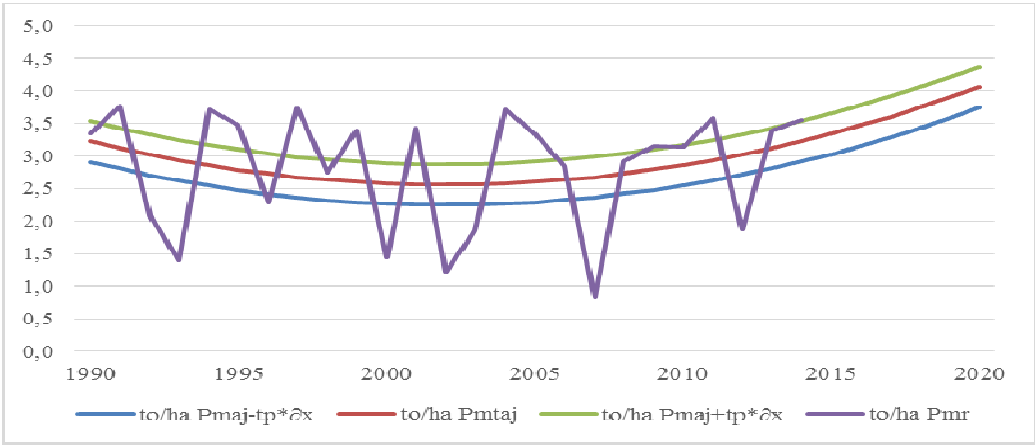
* Pmaj= Average adjusted production, tp= transgression probability

Figure 9. Graphical representation of the total cereal average production, equation calculated for the period 1990-2014 and production extrapolation by 2015-2020 at the country level



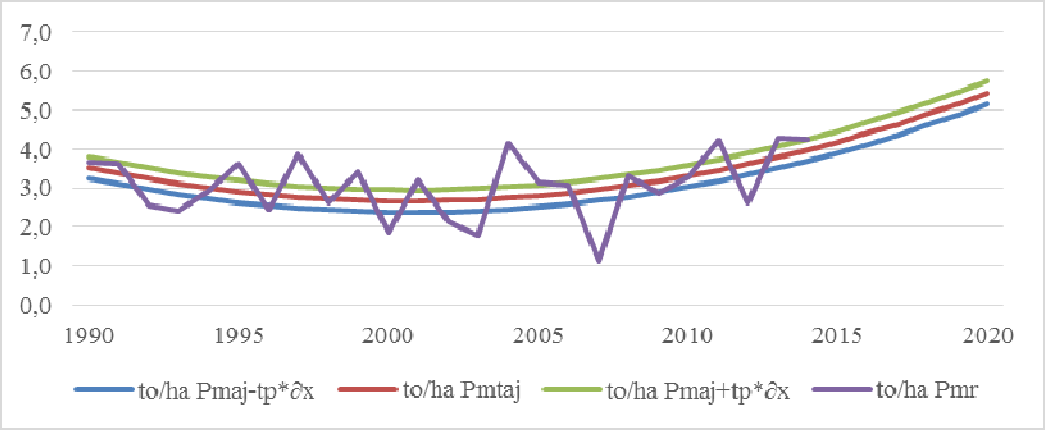
* Pmaj= Average adjusted production, tp= transgression probability

Figure 10. Graphical representation of the total cereal average production, equation calculated for the period 1990-2014 and production extrapolation by 2015-2020 for South-East Region



* Pmaj= Average adjusted production, tp= transgression probability

Figure 11. Graphical representation of the total cereal average production, equation calculated for the period 1990-2014 and production extrapolation by 2015-2020 for South- West Oltenia Region



* Pmaj= Average adjusted production, tp= transgression probability

Figure 12. Graphical representation of the total cereal average production, equation calculated for the period 1990-2014 and production extrapolation by 2015-2020 for South-Muntenia Region.

From the regions with an important increase we observe South-Muntenia and Bucharest-Ilfov; plausible scenarios considering the natural conditions and also that a part of surfaces have irrigations in this areas.

4.4. The annual growth rate and the correlation between total productions, average productions and cultivated surfaces.

Our analysis is finalized through the annual growth rhythm calculation and the correlation between the surfaces and average productions for the period 1990-2014, where we can observe annual decrease rhythms for the surfaces and annual increase rhythms for the average and total productions. The highest increases are at average productions, influencing of course the increases for total productions, The correlation made with Pearson coefficient shows a distinct significant correlation between the 2 indicators for North-East Region and significant for North West and Centre Regions.

Table 16. The annual growth rhythms and correlation between surfaces and average productions for the period 1990-2014.

Conclusions

The cereals grain are the most important vegetable source of food for both humans and animals. An indispensable part of human food consumption is provided by cereals, it is therefore very important to know the evolution of grain production indicators.

The total cereal production analysis has highlighted major differences between the two periods both in the country and in the regions. Total production fell 0.5% on average over the period 1990-2006 and had a slight increase in the period 2007-2014, 1.48% per year. Comparing total production averages, for those two periods, in regions and at country level, we see that they are not significantly different.

In order to capture the trend equations for the period 1990-2014, which to have a significant correlation report, were used equations of the second degree for eight situations and third degree for one situation. Country-wide trend is that total cereal production to increase to 22,256 million tons, with limits for a 95% probability between 20,916 million tonnes and 23,595 million tonnes.

Analyzing the cultivated areas these were of 5, 95 thousand hectares in 1990-2006 and 5,274 thousand ha during 2007-2014. Differences between surfaces were large, that statistically are very significant.

From extrapolation using trend equations, grain acreage will fall to 5,122 thousand ha in 2014 to 4,666 thousand ha in 2020, with limits between 4,503 thousand ha and 4,830 thousand ha.

Analyzing the average productions compared to both periods, we find that they had a growth rate of 0.61% over 1990-2006 and 2.32% for the period 2007-2014.

Average production extrapolation with equations trend for the period 2015-2020, presents an upward trend, the average cereal production to be 4.51 t / ha, with limits between 4.3 t / ha and 4.7 to /Ha. The highest yields to be obtained in South Muntenia 5.45 tons / ha. This is possible to achieve if the improve technologies trend will maintain and continue in the next period.

Through the presented study it can be considered that the developed scenarios for the period 2015-2020 may constitute useful tools in the development of some measures to promote the development methods of strategic marketing initiatives. In addition, the knowledge of the current position and development trends of the cereal sector can provide scientific bases for the elaboration and adoption of the best policies and development strategies of which we have or can have comparative advantages. The objectives and results of this study are of topical interest and can be used by the cereals markets analysts in order to elaborate, strengthen and implement the agricultural public policies regarding the agriculture development.

Abstract

This paper presents a practical approach of the use of a methodological system for estimating the production costs and indicative prices from the manufacturer, as well as the yield degree for the main vegetables products from Romania.. For this purpose it will be used an informational system for production technologies analysis and calculation, of the revenues and expenditures budget, as well as for specific technique and economic indicators of vegetables production. Through its complexity, the calculation system constitutes an informational guide that allows users the access to data and information on the estimates relating to the assessments of the vegetables products demand and target price from the manufacturer, in order to increase the inputs allocation and achieving high and efficient productions. Also, the content and methods of making the informational guide is based on achieving results in developing and strengthening public policies on integrated support management support schemes for farmers, promoting and forecasting the trends on the vegetable market sector in terms of absorbing potential volume of demand and supply, developing consultancy solutions and fostering knowledge transfer and innovation in agriculture.

Keywords: production costs, prices, profitability, calculation system

Introduction

The vegetable products market in Romania is characterized by joint action of producers and consumers, and the lack of any offer can create difficulties in stabilizing the market creating periodic and annual price fluctuations.

Each vegetable product is obtained under an appropriate production technology. From a technical point of view the production technology records a series of timely operations sequenced in a logical order, and from an economical point, the technology is the sum of costs for each technical operation. The implementation of the production technology results are obtaining vegetable products which, economically, are characterized by a certain value recorded in the price of the product. We can deduce that profit maximization can be achieved by minimizing production costs per unit, by maximizing the selling price of the product, or both.

Production costs and prices of vegetable products are fully interdependent, their analysis being carried out coherent and systematic. Due to the influence of inflation, private agricultural structures, largely unconsolidated and noncompetitive, pricing for vegetable products calculated based solely on the free market can cause imbalances between supply and demand.

If the price of the obtained product, as a result of the variation of the demand and supply, falls below production costs, they can not be recovered. In such cases, the main measure to counteract the negative effects of the market lies in careful planning of vegetable production, thereby avoiding a situation where the market price of a product could fall below production costs.

Establishing the optimal price for vegetable products and the organization and efficient functioning of agricultural markets requires creating and implementing a computer system that, along with a system for providing statistical data, can meet the requirements of market economy. In this context it is mandatory to achieve the following objectives: estimating production costs and the prices of agricultural products; creating an informational guide on estimated prices and the appreciation of the production potential of main agricultural products.

Material and Methods

To achieve the case studies the main vegetable crops in Romania were selected, in order to highlight the utility of the computing system designed for technical and economic substantiation of production costs and price estimate of recovery of vegetable products.

From the methodological point of view technical and economic substantiation of production technology and production costs are achieved, average prices for capitalization and the degree of profitability for the main vegetable crops in Romania. From a technical standpoint, it starts with the technological preparation of each crops selected, differentiated by the allocation of factors of production, and by what is yielded per unit area, appropriate to the economical conditions for the selected farming system.

The computer system is made out of the following modules/components (Figure 1):

1. UI
2. Administrative module
3. Calculation module
4. Reporting module
5. Import/export data module

The application is based on a computing platform consisting of:

a) Operating system
b) Database
c) Server Application

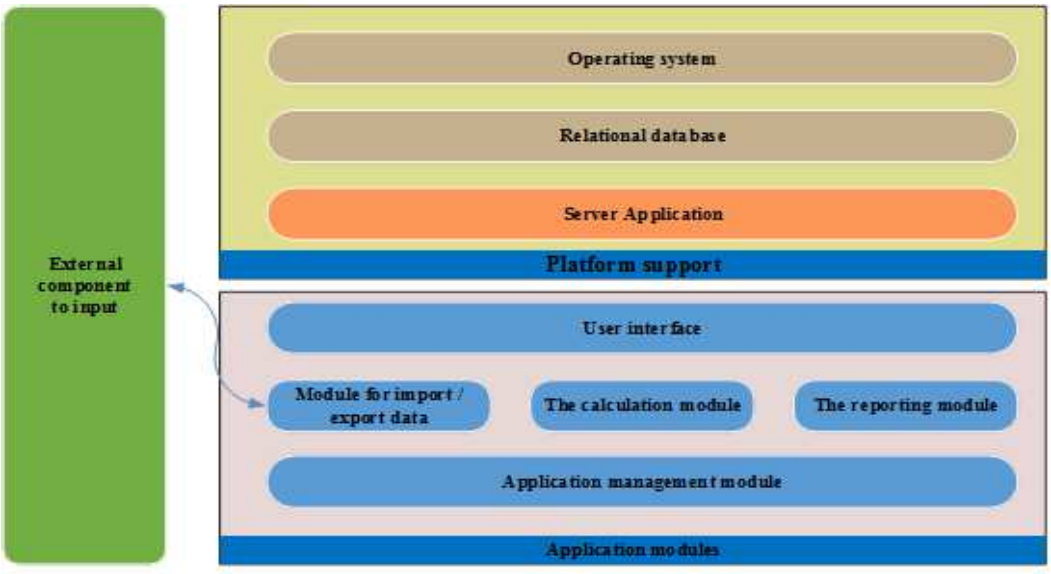

Figure 1. Scheme computing system software modules

The system architecture has considered the possibility of using the computer system simultaneously by internal and external users (Figure 2).

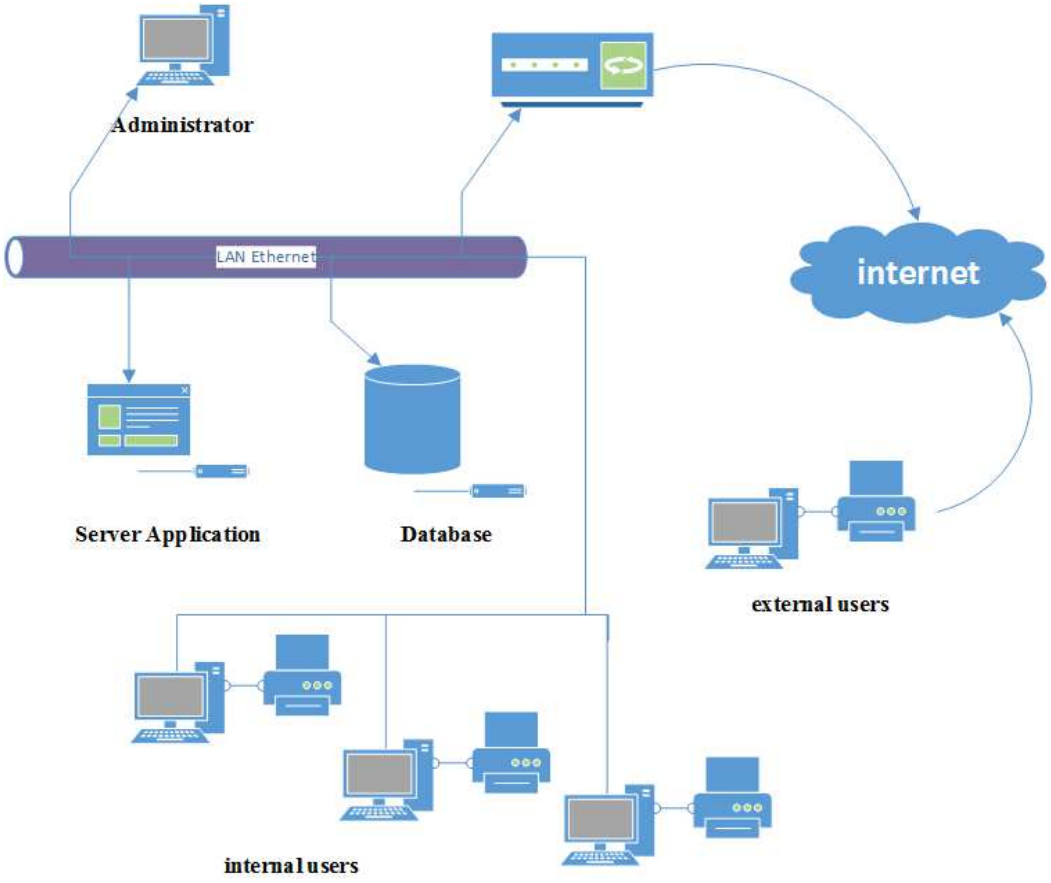

Figure 2. System architecture computing

Results and Discussions

I. Presentation of the database as part of the computer system.
The computing system uses a relational database managed through a proper system of programs. The database is organized so as to ensure the possibility of chaining in processing registrations and to eliminate duplication of information. However, the database is the common source of data for all subsystems of applications in the computing system.

In the computer system, the database consists of a collection of tables classified accordingly by the use and purpose for which they were created. Thus, the database includes:

- tables or permanent basis (constant), which contain information that is frequently consulted in the process of automatic processing;
- Tables variables that store quantitative data are updated frequently;
- auxiliary tables, which are establishment by a set of intermediate results required in processing.

The organization of these types of tables is a primordial requirement in the data processing system of calculation. We note that the information is recorded in coded form tables once they are used repeatedly to different treatments, systematically resorting to this unique source. The most important operations which is performed upon tables are query and maintenance (adding new records, updating records and deleting records). As a solution for encoding information is the most appropriate

automated processing numerical coding as the codes are unique, they can have long-term stability and flexibility in coding.

In the computer system, for an easy identification of the information required for processing, there were made encoding for mechanical works, manual works, seeds and seedlings, materials, and delivery prices, fungicides, herbicides, etc. Thus, the computer system has the following lists:

- lists with the names of cultures, of the production levels and allocation of agrotechnical production factors include: technology codes, codes for cultures used to establish the unit price of culture, the name of the technology, codes and quantities for primary and secondary production of crops, codes for phytosanitary actions and numbers for culture variation.
- The nomenclature of mechanical works includes: group works norm production, consumption norm, mechanized hours, payment rates.
- classification of manual work includes: manual labor group, band work, workload, man-days / unit of measure, payment rates.
- Lists of seeds, seedlings and various materials contain: codes that identifies the material, the material's name, unit of measure, unit price of material used, the identification code of the type of material.
- The classification of pesticides includes: identification code of the pesticide, the name of the material used, the concentrations of active substance, unit of measure, unit price of the pesticide.
- The nomenclature of phytosanitary actions includes: phytosanitary action code (this code groups several substances used in plant protection proceedings), code of the substance used, the amount of substance.
- mock crops include: code layout associated to the list of crops, job type (mechanical / manual), code of the paper, the volume of the work, materials and equipment and the volume associated with the current job, the calendar year in which the work is carried out, month in which the work is carried out.

II. Substantiation methodology of development of system models used in the calculation system:

A. The layouts for product technology

Production technology for vegetable crops includes enumeration, the sequence and description of operations, agrophytotechnical methods and procedures, type and nature of materials, machines and devices that are used determining using climatic factors and/or biological characteristics of plants, to obtain maximum production unit/surface, with minimal costs per unit of product.

The layout technology system includes the technological files for vegetable crops, which include technological links in chronological and logical sequences, materials and labor consumption, values of the consumption. All these technological elements are divided in months, quarters and annualy for the unfinished production. The technological sheet is drawn up for the area of 1 hectare per crop and it includes:

- the name of culture, the average system culture (field or area protected);
- the columns relating mechanical work contain: name of the work mechanical unit of measure, unit agriculture (tractor + car zone), the group works norm production, consumption norm, hours Motor-rates Payment work and mechanization costs;
- for manual labor we have data covering: manual labor name, unit of measure, group classification, ensemble work, workload, manual man-hours, payment price handiwork, manual work expenses;
- for various materials we have data regarding: the name of the material used, the unit of measurement, the amount of material used, the unit price of materials used, the total amount of various materials. By various materials we refer to inputs used to build production namely organic and chemical fertilizers, plant protection products to combat diseases and pests, herbicides, irrigation water etc.

The technological descriptions of the vegetables are required for programming, preparation and organization of production under economic conditions serving to determine the necessary means and manpower, as well as the direct costs of production required. Being an important source of

information for the preparation of annual production budget of income and expenditure sheet allows tracking technological and systematic control over the economic activity of the agricultural unit.

B. The layouts for budget revenue and expenditure of the product

The layouts for the income and expenses of the product include income from primary production, secondary and allowances, intermediate consumption, production costs, price, manufacturer, profit. Drafting of revenue and expenditure statement is based on technology. The structure of revenue and expenditure shall include elements related to:

- Production value, which is based on the average production per hectare and the estimated price on the domestic market;
- Intermediate consumption used for the output of main expenditure groups include the following:
  - Variable expenses, which include costs of materials and supplies (seed and planting material expenses, organic fertilizers and chemicals, expense with products against pests and diseases, expenses with other materials) costs mechanization, the expenses with irrigation (water consumption applicable to the culture), supply expenses (expenditure incurred for procurement, storage and transport of materials and materials provided in the technological schedules) expenses, temporary labor (representing the employees for performing different activities), expenses with crop insurance (rates are set according to the crop's risks and quotations, depending on the frequency manifestations of risk factors).
  - Fixed expenses, which include costs of permanent labor and management (representing expenditure taxes, maintenance assets, third party services, various services, etc.), interest expense on loans (fixed as a percentage of tech expenditures the technological sheet prepared for each crop).
- Taxable income is obtained by the difference between primary and intermediate consumption for the production of primary production value.
- Net income is based on the reduction of taxable income taxes related value.
- The taxable income rate is a percentage of the taxable income reported for the main production costs.
- The percentage of net income is the percentahe to net income reported for the main production expenses
- The production cost is the ratio of expenditures for the main product and main production culture
- The predictable domestic market price is the price at wich the crop is to be sold refferenced with the year.

C. System models for technical and economic indicators

The layouts for the technical-economic analysis was designed to achieve economic efficiency of production technology and includes:

- Indicators of production with respect to average production and production value reported in 1 hectare
- Economic indicators, referring to the structure of production costs, unit cost of production and price recovery, labor productivity, the yield rate of return, breakeven rate risk of exploitation

For the analysis of investment projects at farm level / vegetable farms is achieved breakeven analysis or cost-volume. Thus one can appreciate the relationship between the volume of production, production costs and profit.

III. Diagram of operation of the computer system

From a functional perspective, the computing system comprises the following components:

1. Component maintenance data
   a. Data entry
   b. View existing information
2. User interface component
   a. Select actions
   b. Set parameters
3. Specialized computing components
   a. Computing technology
   b. Calculating budgets

c. Calculation of indicators

4. Reporting Component
   a. Internal reporting database content
   b. Reporting generated technology
   c. Budget reporting income / expenses
   d. Reporting indicators

Schematic diagram of the functional application can be described as follows (Figure 3):

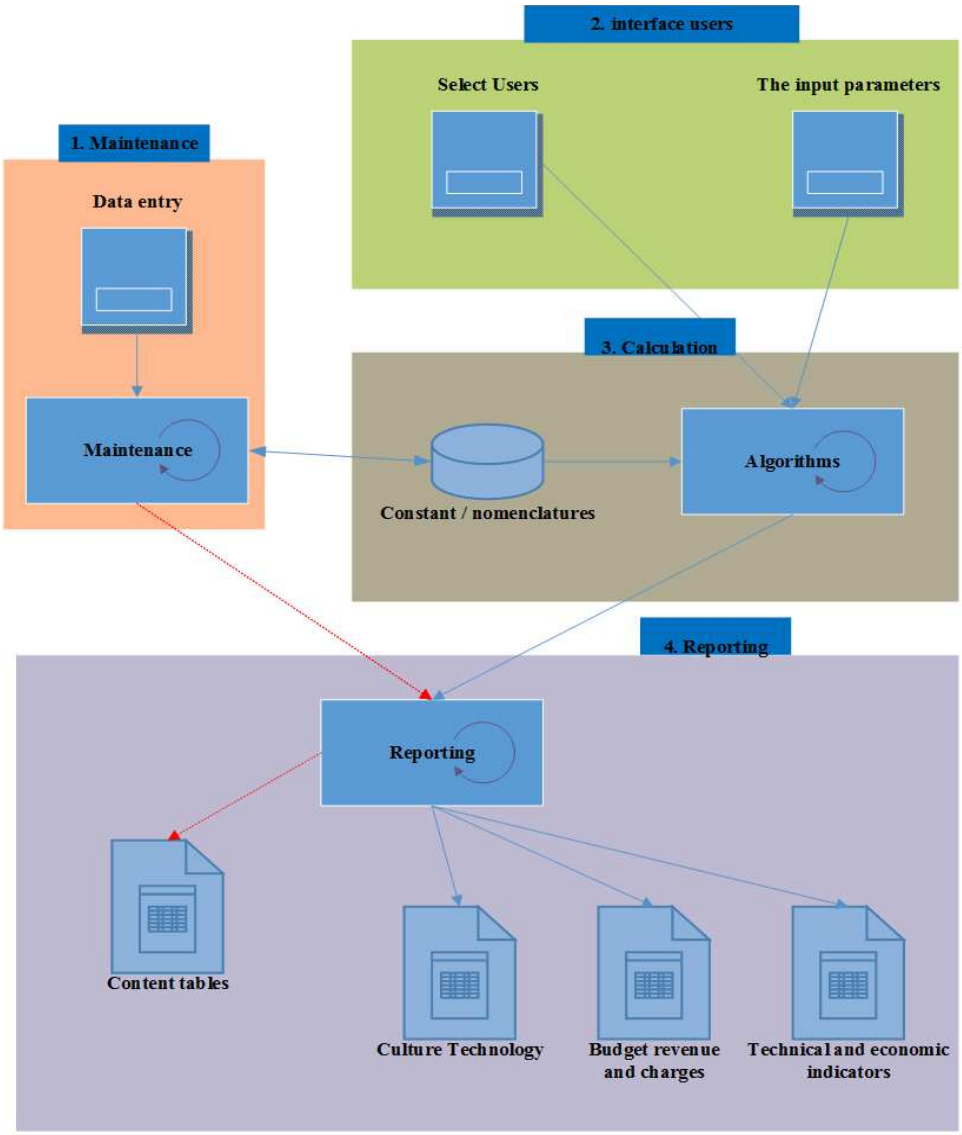

Figure 3. Scheme functional computer system

For the computing system to be effective, they considered some evaluation criteria, namely:

- compatibility database created with other computer systems;
- the possibility of including the computer system in a similar computer program;
- ratio of outcome or results achieved by implementing the computer system and all development costs to be as economically efficient;
- the design and implementation of the computer system took into account user requirements.

IV. Exemplifying the computer system for the main field and vegetable crops in protected areas.
For efficient use of the computing system we recommend the following:

- technological charts have to be developed by research experts from institutes with development profile;
- economic substantiation technologies for production and estimated production costs and domestic prices predictable crops under study, will consider technological input prices for the year in question. To calculate average tariffs on mechanization, will consult specialists from research institutes for agricultural mechanization development, production specialists;
- tariffs on irrigation works will be taken for 1000 cubic meters water prices set by legislation;
- Seed prices are taken from specialized units in the field;
- prices of fertilizers will be averaged using the companies that produce and charged them;
- prices for herbicides and pesticides used in crop technologies will be used from the distribution firms;
- tariffs and prices will be updated depending on market developments from the areas where the holding/vegetable farm is located.

The values of technological inputs mentioned above may influence production costs so predictable market prices will be established so that, each vegetable crop farmer to be able to cover their production costs and to ensure return appropriate to the culture system practiced.

The computing system is validated by the economic efficiency of production technology, measured by the ratio between incomes and expenses. Solution given hardware system is validated if the size of the benefit per hectare is optimal. Otherwise, we recommend reducing the costs per hectare, eliminating some optional technological works to compliance with the normative costs.

For example took into account two vegetable crops grown in the open and protected spaces 2015: peppers and tomatoes. For each vegetable crop, the informational system was used for analysis and calculation technologies of production, income and expenditure budgets and the specific technical and economic indicators. Based on the results of the analyzes were performed measurements of economic efficiency and profitability thresholds.

A. Pepper
A.1. Substantiation cost of production and predictable domestic market price for growing peppers (Table 1).

- Bell pepper cultivated field:
- The growth rate of revenues growth rate is higher by about 1.14% of the expenditure.
- Material expenses: a share of 64% of all resources consumed.
- The cost per unit of output - indicator reflecting the economic efficiency of expenditure items - 0.5 euro / kg.
- The average selling price per unit of output - factor with qualitative character in relation to time - 0.568 euro / kg. Culture has a return of 14.5% which is equivalent to an increase of the degree to which resources consumed brought profit.
- Gross rate of return of 14% shows a favorable situation that characterizes positive work culture bell pepper field.
- Labour productivity: 1 ton bell pepper field was obtained with a consumption of 58.3 hours for work (of which 1.3 hours / t / and mechanical works 57 hours / t / manual work).
- Safety index of the culture is 0.4%.

- Bell pepper cultivated in protected space (solar)
- The growth rate of revenues growth rate is higher by about 1.24% of the expenditure.
- Material expenses: a share of 66% of the resources consumed.
- The cost per unit of output - indicator reflecting the economic efficiency of expenditure items - 0.52 euro / kg.
- The average selling price per unit of output - factor with qualitative character in relation to time - 0.636 euro / kg. Culture has a return of 24.3% which is equivalent to an increase of the degree to which resources consumed brought profit.

- Gross rate of return of 24.3% shows a favorable situation that characterizes positive work culture in solar pepper.
- Labour productivity: 1 tonne of pepper in solar was obtained with the time consuming work of 65.2 hours (including 1 hour / t / mechanical work and 64.3 hours / t / manual work).
- Safety Culture Index is 0.6%.

Table 1: Financial ratios pepper

Source: Own calculations - Values are targeting indicators and may change depending on changes in output and input prices, seasonal conditions and characteristics vegetable farm.

A.2. Determining breakeven; simulations of possible scenarios for the cultivation of pepper

- Bell pepper cultivated field (Table 2):

- at an average of 25t/ha, breakeven is 7825 euro value in units and 13.8 t expressed in physical units. To an increase in turnover by 20% the result (amount of gross profit) increased by 44.5%. Price recovery for growing peppers in the field can vary from 0.45 euro / kg, while the turnover is reduced by 20% to 0.68 euro/kg, while the turnover increases 20%. The situation pepper culture in the field of culture for the year can be assessed in the study, compared to breakeven, as comfortable as actual turnover by 40% exceeds the critical point.

Table 2: Breakeven: simulations of possible scenarios for pepper field

	Fiscal value EUR / ha	Variable expenses EUR / ha	Margin on variable costs	Fixed expenses EUR / ha	Gross
Values	14.204	10.196	4,008	2,208	1,800
%	100	72	28	-	-
Breakeven	7825	5.617	2,208	2,208	0
Obtainable result in an increase in turnover by 20%	17.045	12.236	4.810	2,208	2602
The result obtainable from a decrease in turnover by 20%	11.364	8157	3207	2,208	998
Maintaining the initial result when turnover is reduced by 10%	13.422	9635	3.787	1,987	1,800

Source: Own calculations

- Bell pepper cultivated in protected space (solar) (Table 3):

- at an average of 50t / ha, breakeven is 13 952 euro in units and 21.9 t value expressed in physical units. To an increase in turnover by 20% the result (amount of gross profit) increased by 35.6%. The price recovery in the solar pepper crop can vary from 0.50 euro / kg, while the turnover is reduced by 20% to 0.76 euro / kg, while the turnover increases 20%. The situation pepper culture in the solar year in the study of culture can be appreciated in relation to breakeven, as comfortable as actual turnover by 60% exceeds the critical point.

Table 3: Breakeven: simulations of possible scenarios for solar pepper

	Fiscal value EUR / ha	Variable expenses EUR / ha	Margin on variable costs	Fixed expenses EUR / ha	Gross

B. Tomatoes

B.1. Substantiation cost of production and predictable domestic market price for the summer-autumn crop of tomatoes (Table 4).

- Autumn summer tomatoes grown in the open

- The growth rate of revenues growth rate is higher by about 1.20% of the expenditure.
- Material expenses: a share of 48.8% of the total resources consumed.
- The cost per unit of output - indicator reflecting the economic efficiency of expenditure items - 0.27 euro / kg.
- The average selling price per unit of output - factor with qualitative character in relation to time - 0.329 euro / kg. Culture has a return of 20.5% which is equivalent to an increase of the degree to which resources consumed brought profit.
- Gross rate of return of 20.5% shows a favorable situation positive activity that characterize the tomato crop in summer and autumn field.
- Labour productivity: 1 ton of tomatoes summer-autumn field was obtained with a consumption of 65.04 hours for work (of which 0.99 hours / t / mechanical works and 64.05 h / t / manual work).
- Safety index of the culture is 0.4%.

- Autumn summer tomatoes grown in protected space (solar)

- The growth rate of revenues growth rate is higher by about 1.26% of the expenditure.
- Material expenses: a share of 54.4% of the resources consumed.
- The cost per unit of output - indicator reflecting the economic efficiency of expenditure items - 0.33 euro / kg.
- The average selling price per unit of output - factor with qualitative character in relation to time - 0.420 euro / kg. Culture has a return of 26.6% which is equivalent to an increase of the degree to which resources consumed brought profit.
- Gross rate of return of 26.6%, showing a favorable situation that characterizes the positive work of the summer-autumn crop of tomatoes grown in solar.
- Labour productivity: 1 ton of tomatoes grown in summer-autumn sun was achieved with the time consuming work 72.18 hours (of which 0.62 h / t / mechanical works and 71.56 h / t / manual work) .
- Safety Culture Index is 0.5%.

Table 4: Financial ratios summer-autumn tomatoes

Nr crt	Indicators	UM	Summer-Autumn tomatoes values

B.2. Determining breakeven; simulations of possible scenarios for the tomatoes

- Autumn summer tomatoes grown in the open (Table 5)

- At an average of 40t / ha, breakeven is 7564 euro and value in units of 240 t expressed in physical units. To an increase in turnover by 20% the result (amount of gross profit) increased by 50%. The price recovery in the summer-autumn crop of tomatoes grown in the open may vary from 0.26 euro / kg, while the turnover is reduced by 20% to 0.38 euro / kg, while the figure business increase by 20%. The situation of the tomato crop grown in the open summer-autumn crop year can be assessed in the study, compared to breakeven, as comfortable as actual turnover by 40% exceeds the critical point.

Table 5: Breakeven: simulations of possible scenarios for the summer-autumn tomato field

	Fiscal value EUR / ha	Variable expenses EUR / ha	Margin on variable costs	Fixed expenses EUR / ha	Gross
Values	13.182	7564	5618	3,375	2,244
%	100	57	43		
Breakeven	7918	4543	3,375	3,375	0
Obtainable result in an increase in turnover by 20%	15.819	9076	6742	3,375	3.367
The result obtainable from a decrease in turnover by 20%	10.545	6051	4,495	3,375	1,120
Maintaining the initial result when turnover is reduced by 10%	12.390	7109	5281	3.037	2,244

Source: Own calculations

- Autumn summer tomatoes grown in protected space (solar) (Table 6)

- At an average production of 90 t/ha, breakeven is 20.590 euro in units and 489.7 t value expressed in physical units. To an increase in turnover by 20% the result (amount of gross profit) increased by 43.8%. The price recovery in the summer-autumn crop of tomatoes grown in solar can vary from 0.75

euro / kg, while the turnover is reduced by 20% to 1.11 euro / kg, while the turnover increases 20%. The situation of the tomato crop grown in solar summer-autumn crop year can be assessed in the study, compared to breakeven, as comfortable as actual turnover by 50% exceeds the critical point.

Table 6: Breakeven: simulations of possible scenarios for the summer-autumn solar tomato

	Fiscal value EUR / ha	variable expenses EUR / ha	Margin on variable costs	Fixed expenses EUR / ha	Gross
Values	37.841	20.403	17.438	9489	7,950
%	100	54	46

The result obtainable from a decrease in turnover by 20%	30.272	16.322	13.951	9489	4.462
Maintaining the initial result when turnover is reduced by 10%	35.782	19.292	16.489	8,540	7,950

Source: Own calculations

Conclusions

On the presented study basis, we conclude that the calculation system can provide information to producers from the vegetable sector, since before the crops establishment, in conjunction with the estimates concerning the demand assessment for different destinations, with the indicative price which will be obtained from the manufacturer, as well as the ways for supporting and stimulating the obtained production capitalization in good condition in the agricultural year. Also, it can be achieved some operational objectives namely: a planned vegetables production and adjusted to the market demand type in terms of quantity at the farm level, of quality and traceability; improving technical and economic management of the vegetables production ; the prices stabilization at the producer and at the processor at a decent level; the promotion of the vegetables technologies that ensure the quality protection of water, soil and landscape, preserving and promoting biodiversity; the analysis of the main specific indicators of yield per unit area, so as to create the possibility that on the basis of some complex analysis can be identified the qualitative and quantitative losses at the farm level.

Acknowledgment

The calculation system is developed within the ADER program, contract No. 1311/2015: "Technical and economical substantiation of production costs and estimates regarding the capitalization prices for tomatoes in field and in protected spaces, cucumber in field and in protected spaces , cornichon, carrots, bell peppers, cabbage, cauliflower, flowers in field and in greenhouse, medicinal plants for conventional and organic agriculture", a project funded by the Ministry of Agriculture and Rural Development from Romania, project coordinator: Rozi Liliana Berevoianu.

Evaluating employee performances in the Romanian organizations

Alexandra Florina Beiu
University of Economic Studies of Bucharest
Bucharest, Romania
alexbeiu@yahoo.com

Abstract:

Performance evaluation is the core business of human resourses management, held to determine the extent to which employees of an organization efficiently fulfill their responsibilities or tasks, and it directly influences the performance of the company. In general, the performance achievement of organizational goals designate any would be their nature and variety. Human Resource Management plays a crucial role in achieving the organization's objectives. A key objective for any organization is to achieve performance standards established for its employees. It is very important to distinguish between the notions of performance and competence. If the first is associated with a process or outcome, the second is synonymous with potential. However, the difference between the two concepts is often imperceptible. The market economy of a country is in constant motion and is subject to permanent change processes. The organizations in turn are forced to keep up with these changes in order to remain competitive. The actions of managers take into account each employee as a distinct individual characteristic. The successful application of human resources management requires the existence of a system of performance evaluation of an incentive system to reward employees and results. In these conditions a survey was conducted on identifying appraisal potential employees.

Keywords: human resources, evaluation, performances, interview.

1. Introduction

Modern management of human resources involves, apart from clarifying roles, creating a climate of openness to the external environment, establish a communication system able to meet the needs of employee participation, stimulating creativity, merit recognition, the liability transfer tasks. To achieve these objectives it is necessary to first change the mentality of managers before changing the employees.

Every organization interested that its employees work to achieve good results. For this reason, people who work in organizations are regularly assessed in terms of their professional performance, and candidates who present to selection for a position are evaluated in terms of psychological characteristics and / or individuals who were found to have a connection for performance in work on that position.

2. Defining employee performance evaluation

Employee evaluation system is mainly focused on improving communication between employees and management of the organization and providing a work environment most favorable course of business. Also, depending on the results of the assessment of employees, organization leaders adopt a series of measures:

- establishing a form of improving training for certain employees;
- the adoption of new solutions on the level and type of remuneration of employees;

- promotion of employees etcetera.

In the mean time, each employee is interested in obtaining an assessment as objective activity and potential and as such, may know better development opportunities existing within the organization, requirements and possibilities for improving his professional training, development prospects career opportunities within the organization and the multiplier rewards.

Performance evaluation is the core business of Human Resources Management, held to determine the extent to which employees of an organization efficiently fulfill their responsibilities or tasks. [1]

Performance evaluation in a broader sense, is considered an action or some type of cognitive activity by an evaluator who appreciates or estimate performance of a person in relation to the performance standards set and representation of mind, with its own system values or his own thinking on the performance.

Performance assessment systems is an intrinsic and crucial system of human resource management as the assessment, when it is not designed as a mechanical activity, proves to have a significant influence on economic and social activity and organizational climate within an organization with direct repercussions on increasing the efficiency generally and productivity in particular.

In human resource management, evaluation of the development potential of those used in the processes of recruitment and selection of employee, the second group reviews the career development of individuals within a company and personal performance evaluation is used to determine the results obtained by each person in the post or work and to estimate the mode of action and future evolution of the occupant of the post.

Employee appraisal can be defined as a set of processes through which are issued judgments on the employees of the enterprise, separately, as holding certain posts, in order to reveal the essential elements of how to achieve the objectives and duties conferred and exercise competences and responsibilities of granting rewards and penalties, to establish the ways of improving the training, the promotion prospects of outlining. [2]

A great importance in human resource management holds the correct evaluation of the results obtained by all employees and each. This assessment requires the correct application of the principle pyramidal leadership at various levels so as to ensure effective control. In synthesis, consists in assessing the degree to which employees meet their personal responsibility to return on them in relation with the occupied position. This process is called employee assessment or evaluation of results. [3]

3. Formal and informal assessment evaluation

Managerial practice in human resources attest that recruitment, selection and promotion decisions, redundancy requires substantiation for some form of performance evaluation. Within organizations there are thus two systems of performance evaluation: informal and formal assessment evaluation.

Informal evaluation of performance - daily relations between manager and employee offers multiple ways for employee performance that can be assessed. One of the concerns managers is to observe and evaluate their subordinates so informal evaluation is ad hoc, relying equally on intuition and on the evidence of results.

Formal evaluation - involves performance evaluation of human resources within the organization in a planned and systematic manner.

This type of evaluation involves a formal contact between the manager and the employee, and documentation of observations on employee performance. Formal assessment of employees is preferred to be performed at certain intervals, usually once or twice a year.

Commonly used in modern organizations, professional, formal assessment proposes several objectives:

- establishing rewards staff - to achieve this goal, the assessment procedure must be based on performance and results actually obtained and should be part of the reward system of the organization. It also allows rewarding employees performance evaluation to be perceived as fair;

- realization feed-back performance - employees feel the need for feedback as correct performance and to evaluate the effectiveness of information that efforts to improve performance. Performance assessment can be used to stimulate employee development, playing an important role in improving the performance and in determining career goals;

- identifying individual training needs and staff development - through performance evaluation may indicate some deficiencies in staff training, to get information on the weaknesses or strengths of employees to receive training or professional development;

- improving communication and increasing collaboration between managers and subordinates - performance evaluation is a basis for interaction those parties who get to know even better; [4]

Tabel 1. The benefits of performance evaluation

For employee	For manager	For organization
- The opportunity to encourage employees to analyze recent results in performance and development; - The recognition of aspects of work that considers difficult or irritating, and the contributions they have been appreciated; - Analysis and confirmation of agreed objectives and standards according to which he will work in the future; -To identify all concrete measures that could be taken to improve the current performance (training, mentoring); - The chance to discuss career aspirations or any movements towards	- The opportunity to motivate employees by recognizing achievements; - The chance to clarify to strengthen key objectives and priorities so that employees can see precisely where their contributions fall; - Opportunity to learn the fears and hopes of the workers regarding their current and future roles; - Basis for discussing and agreeing on lines of action with employees; - Classification of areas of overlap between jobs,	- Succession planning assistance for the post: - identify employees who could be promoted in the future; - requirements development and employee training performers; - Help in workforce planning: identifying strengths and weaknesses in terms of existing professional skills and development requirements of all departments of the organization; -The guarantee that all agreed targets for groups and individual employees harmonize with the objectives of the organization;

professional aspirations; - Improving labor relations by enhancing communication and understanding.	improving overall team.	- Better communication throughout the organization; - Improved organizational results.

4. Interview Performance Review

Interviewing is a specific form of interpersonal communication, planned and prepared, organized by question and answer structure and may purposes: performance evaluation, personnel selection, guidance, discipline.

The objectives of performance evaluation interview, to be determined in the preliminary stage by the manager, employee and communicated early, decisively influences the style and conduct the interview, interview performance evaluation can be sustained for the following purposes:

- recent performance evaluation of the interviewee;
- providing feedback to the employee performance;
- indication of problems existing in the work of an employee;
- identification of business opportunities to improve the activity of an employee;
- improving communication between superior and subordinate;
- bringing arguments on the reward.

Interview performance evaluation involves the following steps:

- interview preparation
- conducting the interview

Advantages and disadvantages associated with different categories of evaluators

The categories of evaluators who can perform human resources performance evaluation within an organization can be:

a) managers or the direct heads;

b) colleagues;

c) internal and external customers;

d) subordinates directly;

e) self-evaluation;

f) external evaluators.

5. Methodology

Motivating employees is one of the major problems faced by each company. The principal data collection is structured based on a questionnaire.

5.1 Sample

Therefore, 586 persons were evaluated, both genders, holding management positions or positions of responsibility in society. Persons age was between 23 years and maximum 45 years.

5.2 Sampling Method Selection

Sample size: 586 people in 41 counties, 21% of respondents working in commerce, 32% in manufacturing and 47% in services.

Inclusiveness: the sample is representative of the collection represented with an error of ± 4.9% at the limited probability of 95% guarantee.

5.3 Data analysis and interpretation

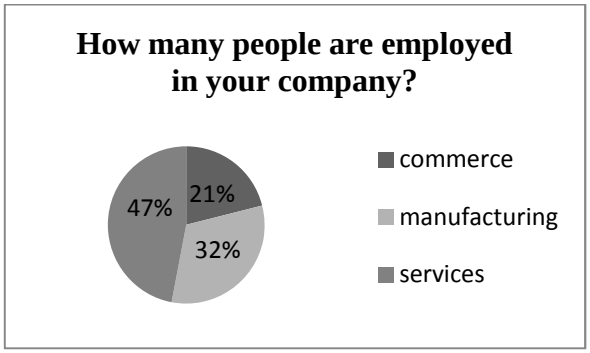

Figure.1 How many persons are employed in your company?

As a result, we see that of the 586 people interviewed, 123 people work in commerce, which represents a rate of 21% of the total sample. Also 187 people work in manufacturing, and the remaining 275 companies working in services, which represents a rate of 47%.

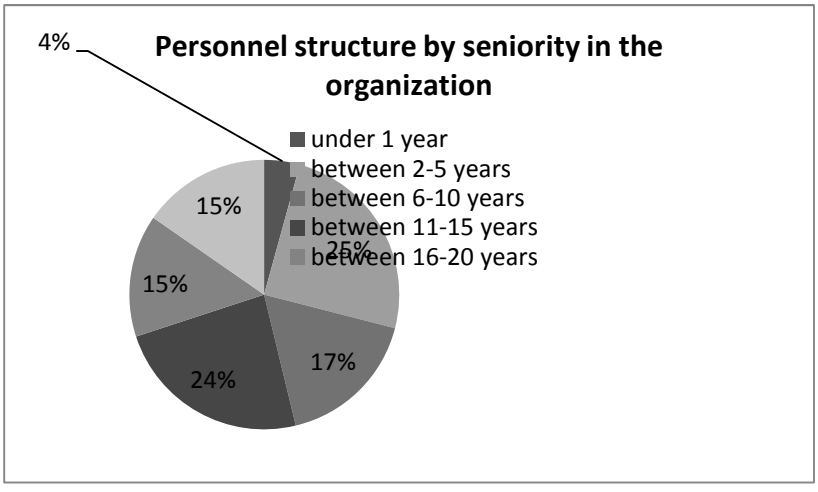

Figure. 2 Personnel structure by seniority in the organization

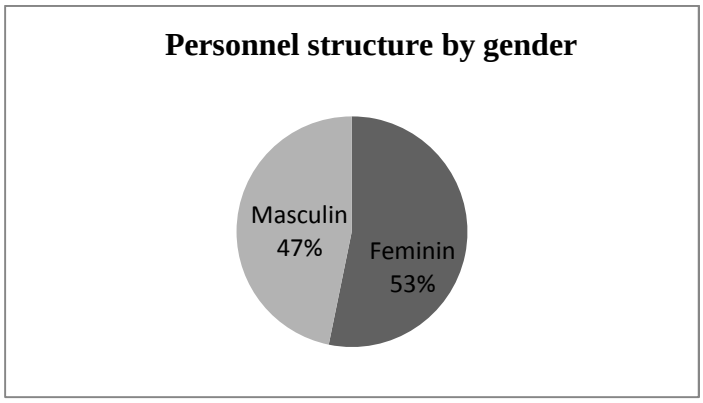

Figure.3 Personnel structure by gender

6. Conclusions

Theme evaluating employee performances plays a central role in management, is one of the most important responsibilities of managers, they must find the best ways to make their subordinates to perform at work.

The conclusions that we can detach behind this research show that there is a strong correlation between the desire to promote openly expressed by a number of factors questionnaire measuring various personality traits.

Performance Evaluation of human resources is important in sizing wages, and to identify the strengths and weaknesses of the employees.

A training program will only succeed if based on careful analysis of the needs of the organization and the success depends on the extent to which it knows to be taught, why, for whom and in what way.

Research on the Relationship between GDP, Unemployment and Employment in the EU-28

Agatha Popescu, University of Agricultural Sciences and Veterinary Medicine, Bucharest, Romania,
E-mail address: agatha_popescu@yahoo.com

Abstract

The paper empirically analyzed the relationship between GDP, Unemployment and Employment in the EU-28 economy in the period 2003-2014 using Eurostat data, descriptive statistics, correlation and regression functions. In the analyzed period, GDP increased by 35.15 %, but it declined in 2009 after the beginning of the economic crisis. Unemployment increased by 20.59 %, with the lowest level recorded in 2008 and then with the highest one in 2013. Employment increased only by 4.38 %, with the highest level in 2008 and a deep decline after and a slight growth of 1 % in 2014. A negative strong correlation, r = - 0.829 was found between GDP and unemployment, and a strong positive link, r = 0.731 was found between GDP and employment. The regression function confirmed that GDP and unemployment are negatively connected while GDP and employment are positively linked. Okun's Law was confirmed by the results, but the asymmetrical dynamics of the indices of the three macroeconomic indicators reflected the deep influence of the global economic crisis on the EU-28 economy. The gap between the output growth and unemployment growth could be caused by a high productivity rate and more worked hours, but also by other factors such as: population aging, education level, gender ratio, and the share of young labor force. Global crisis continues to be a challenge that the EU-28 must surpass by a corresponding strategy destined to harmonize the economic growth with the population well being.

Keywords: EU-28, relationship, GDP, unemployment, employment

Introduction

Gross Domestic Product and unemployment are two important macroeconomic factors characterizing a country economy. They are closely linked because GDP growth sustains, in general, an increased employment and a decreased unemployment. This was empirically demonstrated by Arthur Okun in 1962 in the USA economy. He noticed that between output and unemployment is a negative connection. He affirmed that an unemployment growth by 1 % determines a 2 % fall in output, or, in other words, for each 1 % of output below and above the full employment level, unemployment rises by 0.5 %. (Okun, 1962, Fuhrmann, 2012, Asbury, 2013, Thoma, 2014).

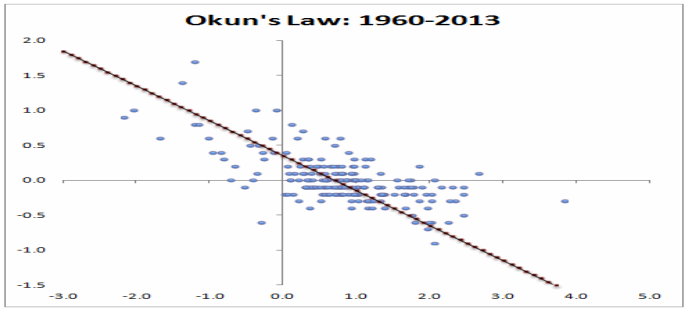

Fig.1.Okun's Law:1960-2013
Source: Mark Thoma (2014)

Other economists considered that Okun was partially right, as it was noticed that output and unemployment do not vary in the same way across different periods and in various economic conditions. For this reason, Okun's Law has many versions: (i) 1 % decline in unemployment rises GDP by 3 %; (ii) 1 % growth in unemployment determines a 2 % decline in GDP; (iii) 1 % increase in GDP determines 2 % employment growth (Furhrmann, 2012, Asbury, 2013).

The link between output and unemployment may chnage over the time due to the changes in the labor market. Therefore, it is an assimetrical relationship between GDP and unemployment over the business cycle (Burgen, 2012, Mc.Bride, 2010, Levine, 2013, Meyer, 2012, Daly, 2013).

But it is unanimously accepted that Okun's Law is a very usefull empirical tool for predicting and analyzing the trends between unemployment and GDP for its precission for short-term forecasts (Knotek, 2007). “Okun’s law” has been included in a list of “core ideas” that are widely accepted in the economics profession" as mentioned Alan Blinder (1997).

In this context, the paper aimed to study the relationship between GDP, unemployment and employment in the EU-28 economy in the period 2003-2014 and check if Okun's Law is verified by the economic reality.

Materials and Methods

Data collection. The study is based on empirical data provided by EuroStat Data Base for the period 2003-2014, especially chosen in order to see what happened in the EU-28 economy in terms of GDP, unemployment and employment before and after the economic and financial crisis which started in 2008. In the study Croatia was included, as found in Eurostat in order to make a complete analysis at the EU level in its actual form.

Methodology. The paper presents the evolution of the three indicators graphically based on the absolute figures, interpreting their evolution in the analyzed period. Also, the relative indices with variable basis were determined for each indicator to better understand its variation from a year to another in the chronological series under study.

The descriptive statistics: mean, standard deviation, standard error, kurtosis, skewness, maximum and minimum, and variation coefficient were determined to empirically characterize each indicator.
The Pearson correlation coefficient was used to analyze the power and sign between GDP and unemployment and GDP and employment.

The linear regression function, $Y= a + bx$, was utilized to reflect the links between the following pairs of indicators: GDP x Unemployment, Unemployment x GDP, GDP x Employment, and Employment x GDP, therefore, each factor has been considered a dependent as well as an independent variable. It was used to adjust the dependent variable (Y) for the period 2008-2014, considering 2008 the year when the economic crisis started to affect the EU economy and the last years reflecting the economic recovery. In this purpose, the adjusted Y was calculated by replacing X from the regression function with its real values. The differences between Y and Y_e allowed to observe what it would have been happened if the economic crisis did not exist and in what measure it disrupted the evolution of each pair of indicators. This allowed to verify the existence and the form of correlation between each pair of economic indicators.

The results were graphically and tabled presented and also commented.

Results and Discussions

GDP Evolution in the EU-28. In the period 2003-2014, the EU-28 GDP increased by 35.15 % from Euro Billion 10,327.8 at market prices in 2003 to Euro Billion 13,958.3 in 2014. Despite its increasing trend, in 2008, GDP slowed substantially and also in 2009, it contracted considerably due to the global financial and economic crisis. In 2010, it started a slow recovery which continued in the next years with a slight pace before its accelerated growth in 2014 (Fig.2.). (National Accounts and GD, EuroStat Statistics).

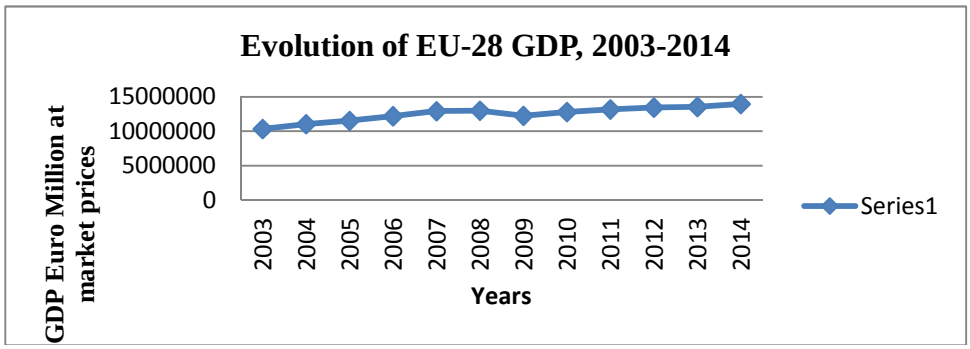

Fig.2.Dynamics of EU-28 GDP, 2003-2014
Source: Own design based on EuroStat Data.

Unemployment Evolution in the EU-28. In the analyzed period, the number of unemployed persons increased by 20.59 % from 20,570.7 thousand persons in 2003 to 24,807.5 thousand persons in 2014. The lowest unemployment was registered in 2008, accounting for 16,660.1 thousand persons, at the beginning of the economic crisis, but in the following year, 2009, the unemployed persons accounted for 21,303 thousands, being by 27.86 % higher than in the previous year. In 2013, it was recorded 26,109.8 thousand persons employed, the highest level, being by 26.92 % higher than in 2003 and by 4.05 % higher than in 2012. But, in 2014, it slowed by 4.99 % compared to 2013.(Fig.3.)

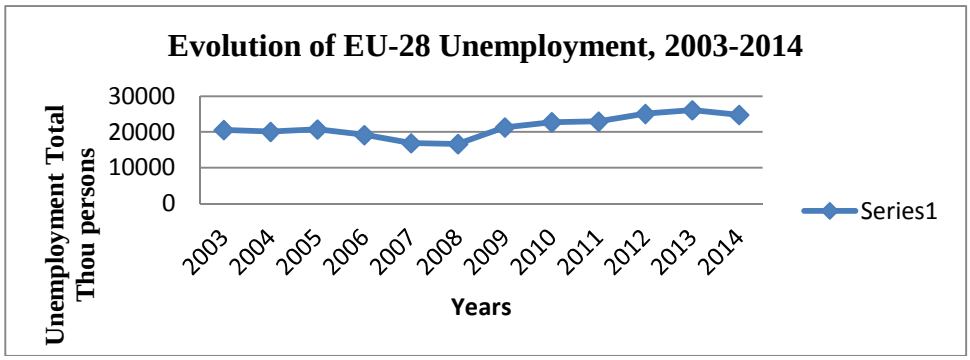

Fig.3.Dynamics of EU-28 Unemployment, 2003-2014
Source: Own design based on EuroStat Data.

Employment Evolution in the EU-28. The employed number of persons in the EU-28 increased by 4.38 % in the analyzed period from 217,078.4 thousands in 2003 to 226,604.5 thousands in 2014. Along the period, it was noticed a continuous growth from 2003 to 2008, the highest employment being recorded in 2008, 231,178.3 thousand persons.

Then, after the beginning of the economic crisis, the employment has continuously declined till 2013, when it reached 224,374.7 thousand persons. In 2014, once the economy has recovered, the employment increased by 1 % compared to 2013. The employment rate had the highest level 70.3 % in 2008. (Fig.4.)

Despite that employment is one of the cornerstones of the economy and well-being development, it was deeply affected by the demographic changes, the EU-28 being facing the population aging, an increased demand for skilled and highly educated employees, an inappropriate share of young labor force, changes in supply/demand ratio in the labor force market. (Europe 2020 Employment).

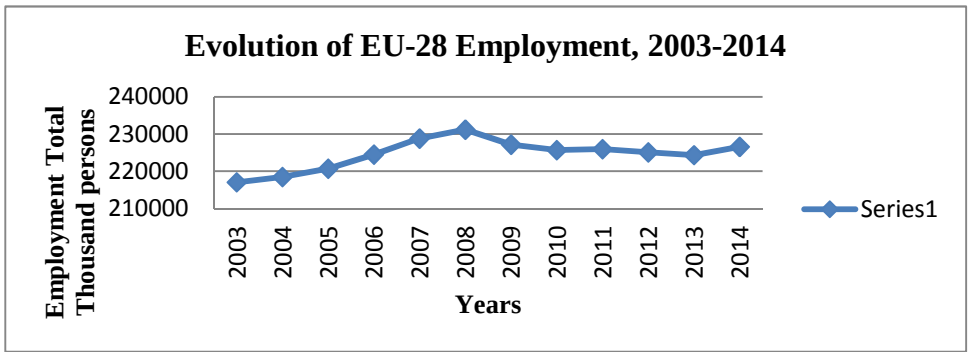

Fig.4.Dynamics of EU-28 Employment, 2003-2014
Source: Own design based on EuroStat Data

The descriptive statistics for GDP, Unemployment and Employment is presented in Table 1. The variation coefficients are less than 15 %, reflecting that the dispersion is a representative one. Employment varied very little, having 1.81 % variation coefficient, the lowest one, while unemployment recorded the highest variation coefficient, 14.23 %, compared to the variation of the other two indicators. GDP recorded 8.71 % coefficient of variation.

Table 1: Descriptive statistics for GDP, Employment and Unemployment in the EU-28, 2003-2014

Statistics	GDP Euro Million at market prices	Employment Total Thousand persons	Unemployment Total Thousand persons
Mean	12,511,363.88	224,652.0833	21,425.90833
Standard Error	314,884.1413	1,179.76312	880.33200
Standard Deviation	1,090,790.663	4,086.81934	3,049.55951
Kurtosis	-0.11885	-0.01181	-0.80610
Skewness	-0.78134	-0.55437	-0.07690
Minimum	10,307,874.6	217,078.4	16,660.1
Maximum	13,958,351.8	231,178.3	26,109.8
Variation coefficient (%)	8.71	1.81	14.23

Source: Own calculation based on Eurostat Data

The evolution of GDP, Unemployment and Employment in the EU-28 in terms of indices with variable basis is presented in Fig.5, Fig.6 and Fig.7, where every variation from a year to another may be observed in the periods of growth and also in the intervals when the EU economy was affected by the economic crisis.

Comparatively looking at Fig.5., reflecting GDP indices dynamics and Fig.5 regarding the unemployment evolution, we may notice an inverse trend. This confirms the negative relationship between GDP and unemployment.

Also, looking at Fig.5. and Fig.7, we can easily notice the GDP and Employment relatively similar declining trends, showing that these two indicators are positively correlated.

The reverse evolution of the Unemployment compared to the slope registered by the other two indicators is obviously clear, looking at Fig. 5 comparatively with Fig.4 and Fig.6.

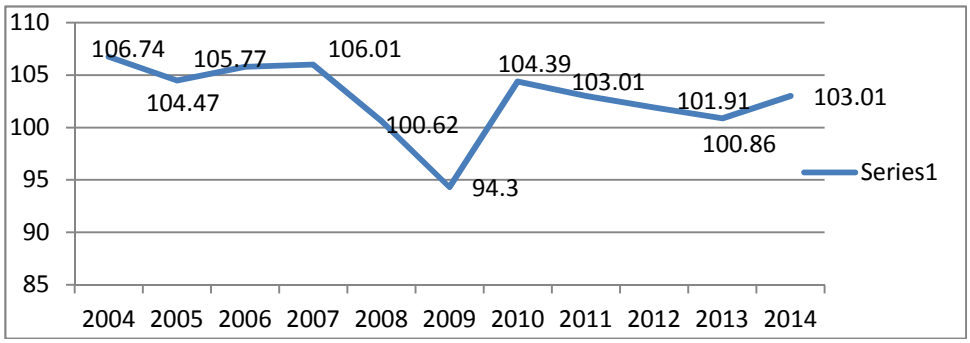

Fig.5. The evolution of GDP indices, EU-28, 2004-2014 (%)
Source: Own calculation and design based on EuroStat Data

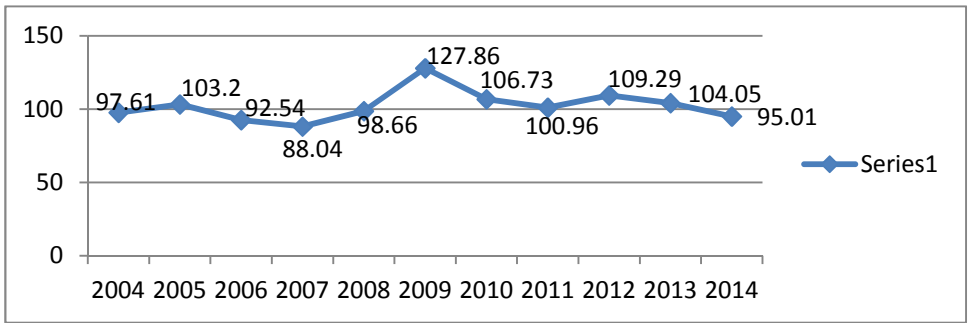

Fig.6. The evolution of Unemployment indices, EU-28, 2004-2014 (%)
Source: Own calculation and design based on EuroStat Data

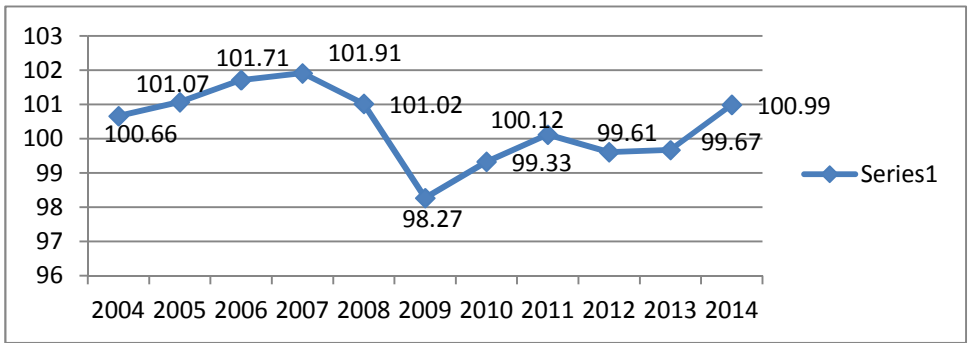

Fig.7. The evolution of Employment indices, EU-28, 2004-2014 (%)
Source: Own calculation and design based on EuroStat Data

Pearson's Correlation coefficient. While between GDP and Unemployment it was found a strong negative coefficient of correlation, r = - 0.82968, between GDP and Employment it was found a strong positive correlation, r = 0.731161. (Table 2). These figures confirm Okun's Law regarding the sense of the relationships between the macroeconomic indicators considered in this study.

Table 2: Correlation coefficient reflecting the relationship between GDP and Employment and GDP and Unemployment in the EU-28

Specification	r- Correlation coefficient	Significance
GDP x Employment	r = 0.731161	**
GDP x Unemployment	r = - 0.82968	**

Source: Own calculations.

The Linear Regression Functions between GDP and Unemployment and the reverse, and GDP and Employment and the reverse are presented in Table 3.

Table 3: Parameters a and b and the linear regression function reflecting the relationship between GDP and Employment and GDP and Unemployment in the EU-28

Specification	Intercept A	X Variable 1 b	Linear Regression Function Y= a + bx	Coefficient of determination R^2
GDP x Unemployment	3.6152	- 0.25234	Y= - 2.339641 X + 3.41908	0.6266
Unemployment x GDP	1.298643	- 0.267815	Y= - 0.267815 X + 1.298643	0.6266
GDP x Employment	0.768080	0.229303	Y=0.229303 X + 0.768080	0.5392
Employment x GDP	-1.33312	2.351253	Y=2.351253 X- 1.333312	0.5392

Source: Own calculations

The values and signs of a and b parameters reflect the trend of the relationship between these pairs of economic indicators.

The R squared values reflect how much of this relationship is determined by the independent variable. In case of GDP x Unemployment pairs of indicators, the coefficient of determination was found 62.66 %, while in case of GDP x Employment it was found 53.92 %.

The influence of GDP on Unemployment is a negative one, as it can be noticed in Fig.8. From Table 4, we may notice the growth of unemployment estimates in the 4th column), calculated using the regression function, and the indices of the actual values (in the 3rd column).

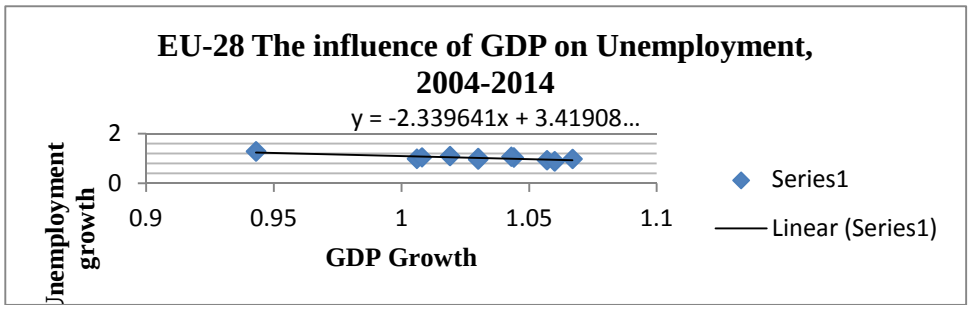

Fig.8. The influence of GDP on Unemployment in the EU-28, 2004-2014

Source: Own calculation and design.

Table 4: EU-28 The estimation of Unemployment depending on GDP

Year	GDP -X	Unemployment-Y	Ye= - 2.339641 X + 3.41908
2008	100.62	98.66	106.49
2009	94.30	127.86	121.27
2010	104.39	106.73	97.67
2011	103.01	100.96	100.90
2012	101.91	109.29	103.47
2013	100.86	104.05	105.93
2014	103.05	95.01	100.80

Source: Own calculations.

There are high differences mainly in the years 2008, 2009 and 2010 when the economic crisis had a deep impact, but then the gap declined from a year to another. The existence and the form of the correlation between GDP and unemployment was verified.

The influence of Unemployment on GDP can be seen in Fig.9 and also in Table 5.

There are differences between the actual values and estimated values of GDP determined by unemployment, mainly in the year 2009 when the effects of the crisis were very strong.

The influence of GDP on Employment was a positive one as confirmed by Fig.10 and the data from Table 6.
A deep decline of employment was determined by the decrease of GDP mainly in the period of economic crisis.
Also, a slight growth of employment begun after starting the economic recovery.

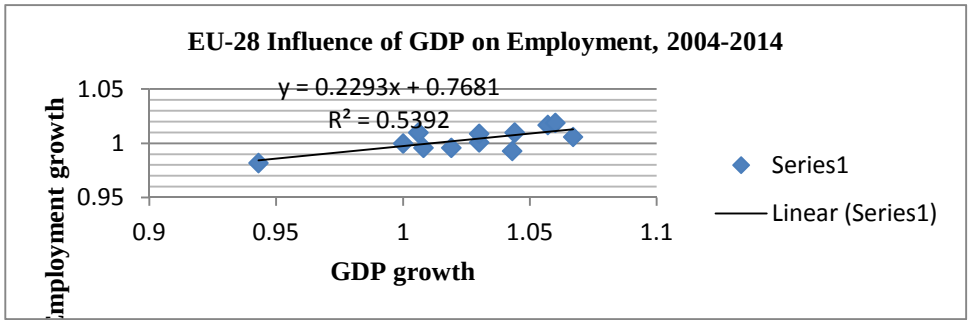

Fig.10. The influence of GDP on Employment in the EU-28, 2004-2014

Source: Own calculations

The increase of employment had a positive effect on the GDP growth or, in other words, the decline of employment could led to a decrease of GDP as it was noticed mainly in the years 2009 and 2010, the years when the EU economy was substantially affected by the economic crisis.

Conclusions

The analysis of the empirical data of GDP, unemployment and employment in the EU-28 in the period 2003-2014 reflected the powerful relationship between these three macroeconomic indicators. The world economic and financial crisis affected the EU-28 economy and produced important changes in the dynamics of output, employment and unemployment.

It is partially confirmed the availability of Okun's Law as long as the economic growth was asymmetrically linked to employment and unemployment in the EU economy. If till 2008, GDP increased and employment as well, the decline of GDP in 2009 has deeply affected unemployment which recorded the critical level in the analyzed period. In the period 2009-2014, employment annual increase was maintained below 1.02 %, the level recorded in 2008, and this confirmed that the policy makers applied a "less job economic growth".

This was caused, besides the economic crisis, by many other factors the EU economy is facing: the unbalanced demographical structure determined by population aging, high demand for employees with high level of qualification, training and education, the gender ratio among the employed people, the share of young labor force, labor productivity, the number of worked hours, etc.

However, it could be considered that the recovery of the EU economy was based mainly on the increase of labor productivity and worked hours.

The socio-economic development of the EU-28 depends both on internal and external factors which must be known and deeply analyzed to enable policy makers to develop sustainable strategies to help the community to surpass the global economic crisis which continues. It is a big challenge to harmoniously combine economic growth and social development.

Research on the Correlation between Economic Growth, Unemployment and Employment. A case study-Romania

Agatha Popescu, University of Agricultural Sciences and Veterinary Medicine, Bucharest, Romania,
E-mail address: agatha_popescu@yahoo.com

Abstract

The paper objective was to analyze the economic growth in close relationship with unemployment and employment in order to identify the main trends and correlation existing among these macroeconomics indicators in Romania during the period 2003-2014. In the analyzed period, GDP increased 2.83 times reaching Euro Billion 52.9 in 2014, while unemployment declined by 10 % and employment by 9.74 %. The economy was affected by the economic crisis in 2009, but since 2010 GDP registered a recovery based on a "jobless growth". The correlation coefficient and the linear regression functions confirmed the negative link between GDP and Unemployment and a weak positive relation GDP x Employment. R^2 pointed out that GDP is responsible of 32 %, and respectively, 56 % of employment and unemployment variation. An inelastic link between employment, unemployment and GDP was reflected by the small negative and positive elasticity coefficients. As a conclusion, Romania's economic growth is based on a consumption model which does not create jobs, 1 % GDP increase resulting in 0.87 % employment decline. A revised realistic strategy is needed to be set up by policy makers in order to harmonize economic and human development in Romania.

Keywords: correlation, economic growth, unemployment, employment, Romania

Introduction

For obtaining a sustainable socio-economic growth of a country it is important to increase GDP in close relationship with employment. However, there are countries where economy is continuously growing while employment remain more or less stable and unemployment rises. This happens due to many factors such as: economic crisis, technical progress, demographical structure, demand/supply ratio in the labor market, wage policy, institutional changes, legal framework (Dopke, 2001, Dumitrescu et al., 2009).

It was empirically demonstrated that the economic growth in terms of GDP has a negative impact on unemployment, but a positive effect on employment (Okun, 1962). However, a normal use of capital stock could be connected with an employment growth. But, it was noticed the contrary that a high capital invested in the economy could led to a high unemployment rate (Persefoni, 2009).

The global economic and financial crisis, which started in 2008, determined many countries to apply a "jobless economic growth". Job creation is a big problem for many EU states, but mainly for the CEE countries (Herman, 2011). Also, the high inflation in the CEECs could affect labor force, employment, unemployment, wages and capital flows (Lupu *et al*., 2015).

Romania was facing a deep economic decline after 1990 till the year 2000, strongly influenced by structural changes, legal framework, the decline of employment and labor productivity, the increase of unemployment and the change in monetary and taxation policy. Since 2000, the economic growth in Romania was assured by consumption under an increased employment mainly in the services sector and under a low productivity. The negative relationship between the economic growth and unemployment in Romania was confirmed by various economists (Dumitrescu, 2009, Herman, 2012, Anghelache *et.al*, 2013, Gibescu, 2013). Also, a positive relationship between GDP/capita and employment rate was another feature of the Romanian economy (Prodan, 2012).

GDP is usually used to empirically characterize the economic growth at regional and international level. Compared to other EU countries, Romania is situated almost on the last positions for its economic growth in terms of GDP and GDP/capita and labor productivity (Iuga *et al*, 2009, Savoiu, 2012).

In this context, the paper aimed to highlight the dynamics of GDP, unemployment and employment in Romania in the period 2003-2014, considered as interval of economic growth, but also significant for the impact of the economic crisis, and to determine the correlation and identify the trends of these three macro economic indicators using the empirical data provided by EuroStat.

The structure of the paper includes two sections: (a)Dynamics and main descriptive statistics of GDP, unemployment and employment, and (b)Analysis of the link between GDP, unemployment and employment using Pearson' correlation coefficient, linear regression function, determination coefficient, estimates of each indicator while the others were constant, and elasticity coefficients.

Materials and Methods

Data collection. The data for GDP, unemployment and employment were collected from National Accounts and GD, EuroStat Statistics for the period 2003-2014, considered both a period of economic growth and decline due to the global economic crisis.

Methodology. The macroeconomic indicators were studied in dynamics both in absolute figures and indices with variable basis. For each indicator it was designed the graphical evolution and determined the descriptive statistics: average, standard error, standard deviation, kurtosis, skewness, maximum and minimum, and variation coefficient (Montgomery *et al*, 2003).

The Pearson correlation coefficient was calculated in order to identify the sense and intensity of the relationship between GDP and unemployment and GDP and employment.

The linear regression function, $Y= a + bx$, was used to characterize the connections between the following pairs of indicators: GDP x Unemployment, Unemployment x GDP, GDP x Employment, and Employment x GDP. Thus, each factor has been considered dependent (Y) as well as an independent variable (X). Also, the linear regression function was used to adjust the dependent variable (Y) for the period 2008-2014. (Montgomery *et al*, 2003, Green, 2002).

The annual growth rate was calculated for each indicator as well as the average growth rate for the whole period 2004-2014 in order determine the elasticity of unemployment and employment in relation to GDP, using the formula was $E_{UN} = \Delta UNEM/\Delta$ GDP for unemployment elasticity and $E_{EM} = \Delta EM/\Delta$ GDP. The obtained results were compared to 1 to identify if the link between indicators is an elastic or an inelastic one. (Tudose *et al*., 2013, Ehrenberg *et al*., 2012). The results were graphically and tabled presented and also commented.

Results and Discussions

The evolution of GDP in Romania. Romania's GDP had a positive dynamics in the analyzed period. In 2014, it accounted for Euro Million 151,230.1, being 2.83 times higher than in 2003, when it was recorded Euro Million 52,931. This is a higher economic growth compared to only 35.15 % in the EU-28 in the same period of time. The increased trend registered a bottleneck in 2009, Euro Million 120,746.4, by 16 % less than in 2008. This was the effect of the economic crisis, but, since 2010, the economy has started its recovery.(Fig.1.) Similar results were found by Iuga et al, 2009.

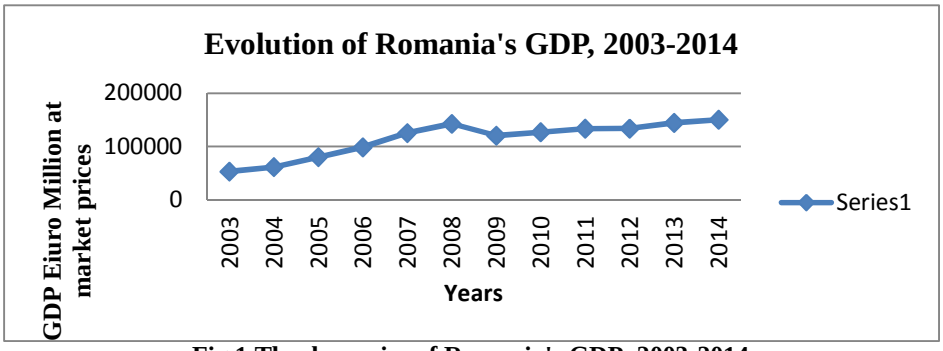

Fig.1.The dynamics of Romania's GDP, 2003-2014
Source: Own design based on EuroStat Data.

The contribution of Romania to the EU-28 GDP is very small, ranging between 0.51 % in 2003, the lowest level, and 1.08 % in 2014, the highest level. The share of Romania's GDP/capita in the EU-28 GDP/capita ranged between 31 % in 2003, the lowest level and 55 % in 2014, the highest performance. (Table 1).

Table 1: Romania's contribution to the EU-28 economy in terms of GDP, GDP/capita, unemployment and employment (%)

	2003	2004	2006	2006	2007	2008	2009	2010	2011	2012	2013	2014
GDP share	0.51	0.55	0.70	0.81	0.97	1.10	0.98	0.99	1.01	0.99	1.06	1.08
GDP/ capita share	31	34	35	38	42	48	49	50	51	54	54	55
Unem. share	3.40	3.86	3.39	3.79	3.80	3.45	3.20	2.87	2.87	2.50	2.50	2.53
Empl. share	4.40	4.31	4.20	4.16	4.09	4.05	4.04	4.05	4.02	3.84	3.82	3.81

Source: Own calculations based on EuroStat.

The evolution of Unemployment in Romania. Unemployment decreased by 10 % from 699.7 thousand persons in 2003 to 628.7 thousand persons in 2014. The highest number of unemployed people was 728.4 thousand persons registered in 2006, and the lowest level was 627.2 thousand persons recorded in 2012.(Fig.2.)

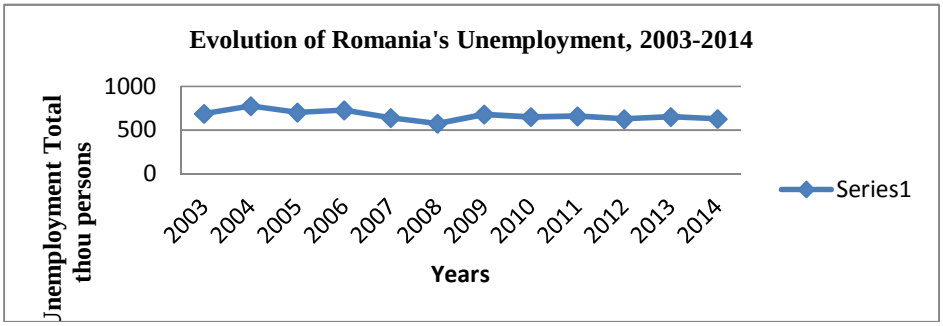

Fig.2.The dynamics of Romania's Unemployment, 2003-2014
Source: Own design based on EuroStat Data.

It is obviously a different situation compared to the EU-28 where unemployment increased by 20.59 % in the same period of time. Romania registered 7.4 % unemployment rate, the highest level in 2011 compared to 5.8 % in 2008 (Iuga et al, 2009). The share of Romania's unemployment in the EU-28 has recorded a continuous decline from 3.40 % in 2003 to 2.53 % in 2014. The highest share was 3.86 %, registered in 2004 and the lowest one was 2.50 %, noticed in 2012 and 2013 (Table 1).

The evolution of Employment in Romania. The number of employed population registered a continuous decline from 9,569.4 thousand persons in 2003, the highest level, to 8,637.8 thousand persons in 2014.

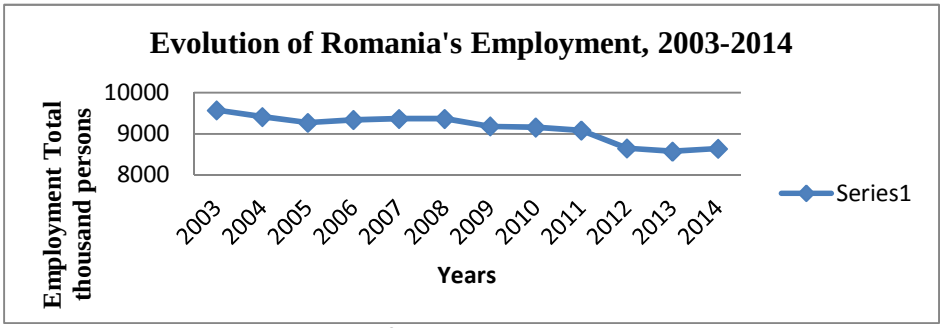

Fig.3.The dynamics of Romania's Employment, 2003-2014
Source: Own design based on EuroStat Data.

The lowest level was 8,569.4 thousand persons recorded in 2013. The decrease in the analyzed period accounted for 9.74 % in 2014 compared to 2003, while in the EU-28 employment increased in the same interval by 4.39 % (Fig.3.). As a result, the share of Romania's employment in the EU-28 employment has continuously declined from 4.40 % in 2003 to 3.81 % in 2014 (Table 1).
The employment rate was 59.7 % in 2012, a middle one in the EU-28, as compared to 75 % in Netherlands, 72.8 % in Germany, 70.1 in United Kingdom, but higher than 51.3 % in Greece and below the EU average 64.1 %. However, the employment rate in Romania is far away of 70 %, the target established by the EU-28 for this country in 2020 and also even the EU has to make efforts to reach its target of 75 % (Serb et al., 2015).
The main statistical parameters for GDP, Unemployment and Employment. In Romania, in the period 2003-2014, the average annual GDP accounted for Euro Million 114,102.95 with Euro Million 33,029.41908 standard deviation and a high variability coefficient, 28.94 %, reflecting that the dispersion is not a representative one.

Table 2: Descriptive statistics for GDP, Employment and Unemployment in the Romania, 2003-2014

Statistics	GDP Euro Million at market prices	Employment Total Thousand persons	Unemployment Total Thousand persons
Mean	114,102.95	9,132.18333	667.33333
Standard Error	9,534.7719	96.96149	15.17444
Standard Deviation	33,029.41908	335.88448	52.57720
Kurtosis	- 0.513496	- 0.73043	0.77315
Skewness	- 0.916372	- 0.78596	0.46159
Minimum	52,931	8,569.4	575.5
Maximum	150,230.1	9,569.4	776.5
Variation coeff. (%)	28.94	3.67	7.87

Source: Own calculation based on Eurostat Data

Employment recorded an annual average of 9,132.18 thousand persons with 335.88448 thousand persons standard deviation and a very small coefficient of variation, 3.67%.

Unemployment registered 667.33 thousand persons in average with 52.57 thousand persons standard deviation and a small coefficient of variation accounting for 7.87 %.(Table 2).

The evolution of GDP, Unemployment and Employment in Romania in terms of indices with variables basis in the period 2004-2014 is presented in Fig.4, Fig.5 and Fig.6.
Making a comparison between the slope of GDP indices and Unemployment indices, it is easy to notice the different evolution of the two macroeconomic indicators, confirming that between GDP and Unemployment is a negative relationship.

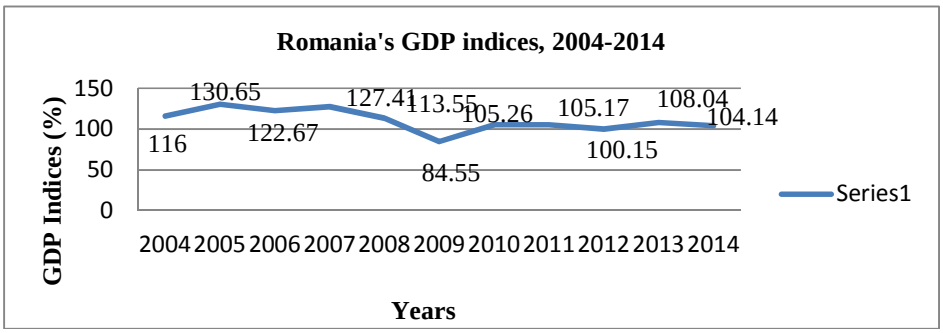

Fig.4.Dynamics of GDP indices in Romania, 2004-2014
Source: Own calculation and design based on EuroStat.

The slope of GDP indices reflects some differences compared to the slope of Employment indices. While in the period 2004-2009, the evolution of the two indicators was almost similar, reflecting a positive relationship, since 2010, GDP started to recover with an inflexion in 2012, while employment continued to decline registering the lowest level in 2012, but then, it started to grow till 2014, while GDP declined in the last year of the analysis. Therefore, in the period 2003-2009, the economic growth was able to create jobs, assuring employment, but since 2010, Romania has been developing based on a "jobless economic grow".

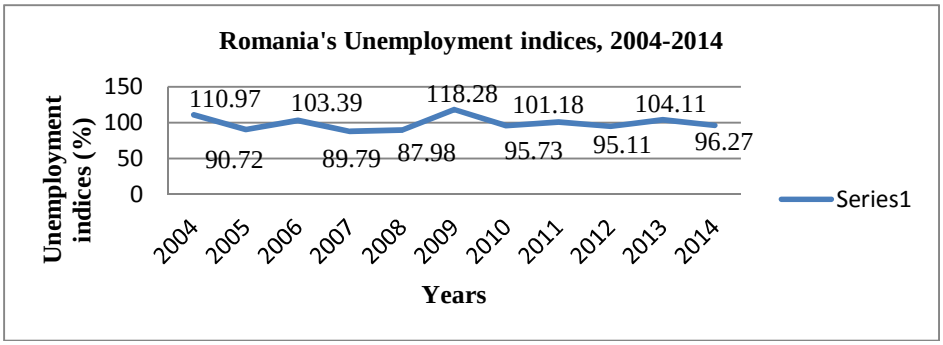

Fig.5.Dynamics of Unemployment indices in Romania, 2004-2014
Source: Own calculation and design based on EuroStat

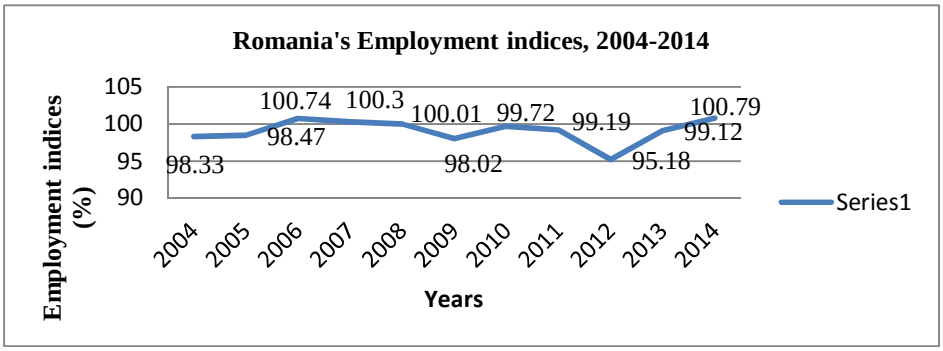

Fig.6.Dynamics of Employment indices in Romania, 2004-2014
Source: Own calculation and design based on EuroStat

Pearson's Correlation coefficient between GDP x Unemployment registered a strong negative value, r = - 0.5751 statistically significant, while the coefficient of correlation between GDP x Employment had a positive value, r = 0.376747, reflecting that an increase of GDP did not produce a high growth of employment in the analyzed period, due to the period when the economy recorded "a jobless growth" (Table 3).

Table 3: Correlation coefficient reflecting the relationship between GDP and Employment and GDP and Unemployment in Romania

Specification	r- Correlation coefficient	Significance
GDP x Employment	r = 0.376747	*
GDP x Unemployment	r = - 0.5751	**

Source: Own calculations.

Iuga (2009) found a weak coefficient of correlation between GDP and Unemployment was between 2005 and 2011, due to the shorter analysis period and the influence of technological development, inputs, taxation, investments, education, legislative framework which positively influenced the GDP growth (Iuga, 2009).

Also, the correlation between GDP and employment is smaller compared to r = 0.7806 between GDP/capita and employment rate for in the period 2002-2011, when employment rate was a significant factor (R^2>50) with a 60.95 % determination GDP variation (Prodan, 2012).

The Linear Regression Functions. For GDP x Unemployment and the reverse, and GDP x Employment and the reverse, it was set up the linear regression function as presented in Table 4.

Table 4: Parameters a and b and the linear regression function reflecting the relationship between GDP and Employment and GDP and Unemployment in Romania

Specification	Intercept a	X Variable 1 B	Linear Regression Function Y= a + bx	Coefficient of determination R^2
GDP x Unemployment	1.41666	- 0.38501	Y= - 0.38501 X + 1.41666	0.56386
Unemployment x GDP	1.91550	- 0.82581	Y= - 0.82581 X + 1.91550	0.56386
GDP x Employment x	0.94891	0.03841	Y= 0.03841 X + 0.94891	0.32015
Employment x GDP	- 1.54676	2.66814	Y= 2.66814 X - 1.54676	0.32015

Source: Own calculations.

The values of "a" and "b" parameters confirmed that between GDP and Unemployment and Unemployment and GDP, it is a negative relationship, while between GDP and Employment and Employment and GDP, it is a positive relationship as mentioned Okun's Law. Also, the determination coefficient R^2 = 0.32015 between GDP and Employment reflected that just 32.01 % of influence on employment is due to GDP, empirically explaining the " jobless economic growth" while the value R^2 = 0.56386 reflected 56.38 % influence of GDP on unemployment.

The influence of GDP on Unemployment is presented in Fig.7., reflecting that unemployment decreased due to the GDP growth.

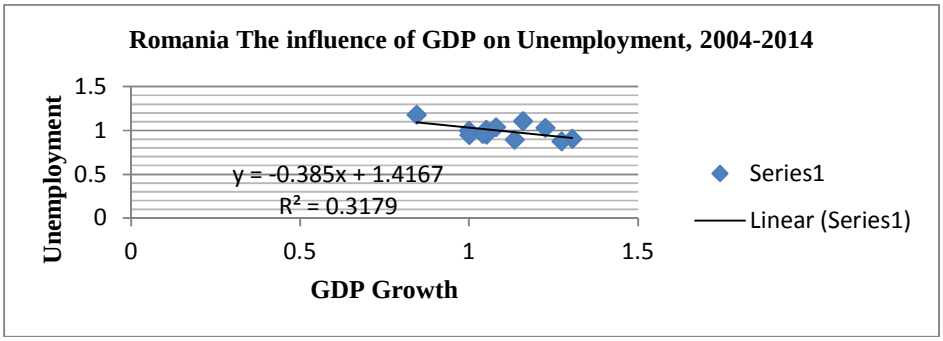

Fig.7. The influence of GDP on Unemployment in Romania, 2004-2014
Source: Own calculation and design

The estimated value of Unemployment, the dependent variable Y, is presented in Table 5 in the last column. Comparing the figures of the real and estimated Unemployment, we may notice important differences and especially in the years 2008, 2010, 2012 and 2014.

Table 5: Romania The estimation of Unemployment depending on GDP

Year	GDP -X	Unemployment-Y	Ye= - 0.38501 X + 1.41666
2008	113.55	89.79	97.94
2009	84.55	118.28	109.11
2010	105.26	95.73	101.13
2011	105.17	101.18	101.17
2012	100.15	95.11	103.10
2013	108.04	104.11	100.06
2014	104.14	96.27	101.57

Source: Own calculations

The influence of Unemployment on GDP was a negative one (Fig.8) and the variation between the estimated value of GDP and the GDP from a year to another were obvious (Table 6).

Table 6: Romania The estimation of GDP depending on Unemployment

Year	Unemployment-X	GDP -Y	Ye= - 0.82581 X + 1.91550
2008	89.79	113.55	117.40
2009	118.28	84.55	93.87

Elasticity of Unemployment and Employment in relation to GDP. The determination of elasticity imposed to calculate the annual growth rates of GDP, Unemployment and Employment, as presented for the period 2004-2014 in Table 9.

Table 9: Annual growth rates for GDP, Employment and Unemployment and elasticity of employment and unemployment in relation to GDP in Romania, 2004-2014(%)

Year	GDP	Employment	Unemployment	Elasticity of Employment	Elasticity of Unemployment
2004	16.0	-1.67	10.97	- 0.10	0.68
2005	30.65	-1.53	-8.28	- 0.04	- 0.30
2006	22.67	0.74	3.39	0.03	0.14
2007	27.41	0.30	-12.02	0.01	- 0.43
2008	13.55	0.01	-10.21	0.0007	-0.75
2009	-5.45	-1.98	18.28	0.12	- 1.18
2010	5.26	-0.28	-4.27	- 0.05	- 0.81
2011	5.17	-0.81	1.18	- 0.15	0.22
2012	0.15	-4.82	-4.89	- 32.13	- 32.60
2013	8.04	-0.88	4.11	- 0.10	0.51
2014	4.14	0.79	-3.73	0.19	- 0.91
Average, 2004-2014	11.59 %	-10.13	-6.47	- 0.87	-.055

Source: Own calculation.

In the analyzed period, it was found a high annual growth for GDP, a negative growth rate in 2009, as a result of the economic crisis and then a smaller growth rate in 2010 and 2011, the lowest positive one

in 2011 and then a recovery in 2013. The average growth rate of GDP in the analyzed period was 11.59 %.

Employment recorded both negative and positive annual growth rates, confirming the "jobless economic growth" practiced mainly in the period 2009-2014. The unemployment annual rates were also both negative and positive, but they had higher values compared to employment. The average increase for Employment was -10.13 % and for Unemployment was -6.47 % in the period 2004-2014. The values of elasticity of Employment and Unemployment in relation to GDP were both positive and negative and very small, reflecting an inelastic link between the these indicators. (Table 9).

The average elasticity of employment in relation to GDP was -0.87, an identical figure with the one found by Herman (2012). The main causes are: policy errors regarding social and economic reform, rigidity in labor market, high labor cost, and the consumption model which does create jobs.

Conclusions

In the analyzed period, GDP increased 2.83 times, while unemployment and employment decreased by 10 % and, respectively 9.74 %. After the impact of the global economic crisis in 2009, the economy restarted to recover since 2010, applying "jobless growth model".

The correlation coefficient, r = -0.5751, confirmed the existence of a strong negative relationship between GDP and Unemployment, while the coefficient of correlation, r = 0.3767, pointed out a weak positive between GDP and Employment. This was also highlighted by the linear regression functions. R squared showed that GDP is responsible of only 32 %, and respectively, 56 % of employment and unemployment variation.

An inelastic connection was found both in case of employment and unemployment in relation to GDP, confirmed by the very small negative and positive coefficients of elasticity, in most of cases less than 1.
Romania's development is based on a consumption model which does not create jobs, as long as it was empirically proved that 1 % GDP increase will led to 0.87 % decline in employment.

Therefore, the policy makers have a difficult task to change the economic strategy, paying attention to investments, job creation and labor productivity to assure a secure economic growth harmonized with human development.

Stochastic Model of Inventory Control

Pavel Pražák, University of Hradec Králové, Czech Republic, pavel.prazak@uhk.cz

Abstract

Optimizing inventory control belongs to fundamental optimization tasks of management of various companies. If some of the variables of the inventory control problem have a stochastic character, it is useful to simulate the problem and subsequently accomplish analysis of obtained data. Such an analysis allows to choose the optimal inventory control. The present paper describes one of the possible variants of solving such a problem. First, the selected model of inventory management is described and then its implementation in MATLAB is characterized. Finally, the selected parameters for a particular simulation are specified and an essential description of gained data are presented.

Keywords: inventories - control - demand - supply –simulation.

Introduction

Inventories can be considered as quite expensive and also very important part of property of many companies and organizations. This means that as long as the organization uses its inventories for its activities it can store a significant variety of assets provided these assets are used in the most effective way they have to be controlled optimally. There are two problems connected with the inventory control: (1) what quantity of inventories to order and (2), when and how often should the company make the orders. In certain conditions it is possible to set analytical models of inventory control where the problems would be solved satisfactorily, Ragsdale (2011) and Ross (2013). However, in a number of real situations some parameters of the problem can have the character of random variable and it is impossible to find any analytical solution. For instance the demand for a given item can be random, which means that the amount of withdrawn inventories is uncertain. Similarly the lapse of time between the order of an inventory supply and the real supply of such inventory can be a random variable, Balakrishnan et al (2007) and Turban et al (2011). As a result a situation may happen where the inventories are totally exhausted. In such a case there can be customers which demand may not be satisfied and the given company carries financial costs because the customers will find a competitive firm or seller. As far as the demand of stored semi-manufactures are concerned such exhausted inventories could lead to delay or stoppage of production resulting in financial loss of the given organization. In this paper we will characterize a model where it is expected that the demand is characterized by random variable with a given probability distribution. We will consider that this distribution as unchangeable in time, which means that the stationary demand is given. The considered probability distribution can come out of empirical findings.

Description of the Model

To be able to describe the considered model in detail, we will introduce the following terms and their labelling:

- The total costs, which will arise during T, $T \in \mathbf{N}$, periods of time in which we follow the development of the amount of inventories of the given semi-product, product, or goods, will be denoted C, $C \in [0, \infty)$.

- The state of inventories at the beginning of the time period t, $t \in [1:T]$, (beginning inventory) will be denoted $Z_0(t)$.

- The state of inventories at the end of the period t, $t \in [1:T]$, (ending inventory) will be denoted as $Z_k(t)$.

- An order which increases inventories will be displayed in such a time period t+1, $t \in [1:T-1]$ when the inventories decrease under the given limit is called reorder point, cf. Ragsdale (2011). It will be denoted as R, $R \in \mathbf{N}$. The amount of the order representing the number of newly stored pieces will be denoted as d, $d \in \mathbf{N}$. Let us add a more detailed commentary. When the state of inventories in the time period t, $t \in [1:T]$ decreases to the reorder point *R* or gets under it a new order *d* is made. The supplier can carry out this order only in the next period of time that is *t*+1 obviously.

- The supplier delivers the consignment it U periods, where U~R(*a*, *b*) a R(*a*, *b*) is a discrete uniform distribution, in which *a* and *b* respectively represents the minimal and maximal respectively number of periods in which the required supply can be delivered. If a new order was made in the period *t*, it will be delivered in the period $t_{dod}=t+1+U$.

- On the basis of the knowledge about the supply period t_{dod} we can assess the amount of inventories in the current time period *t*. When $t=t_{dod}$, then $Z_0(t)=Z_k(t-1)+d$, otherwise it is only $Z_0(t)=Z_k(t-1)$.

- To be able to monitor if the supply of new inventories was ordered and there is no need to make new ones, it is important to implement the control function O(t) for the period t, $t \in [1:T]$. This function reaches the value 1 provided an order was made and it has not been delivered yet. It reaches the value 0 provided the order was delivered and a new one has not been made.

- A new order $O_n(t)$ in period t should be made, provided there is no order i.e. O(t)=0, and $Z_k \leq R$, i.e. the inventories at the end of the period t are smaller than the reorder point *R*.

- The current demand in the time period t, $t \in [1:T]$, will be denoted D(t). We suppose that it is a random variable the distribution of which can be set in the frequency table obtained on the basis of consumers behaviour in the past time periods.

- The demand is satisfied if sufficient amount of units is stored. If we denote the satisfied demand in the time period at *t* as $D_S(t)$, then

$$D_S(t) = \min\{Z_0(t), D(t)\},$$

i.e. provided that at the beginning of the time period *t* the inventories are satisfactory and $Z_0(t) \geq D(t)$, the whole demand D(t), is satisfied , provided the reversed relation is valid the demand is satisfied just to the amount of current inventories $Z_0(t)$, which are available at the beginning of the time period *t.* At the end of the period t the value of stores will be:

$$S_k(t) = S_0(t) - D_S(t)$$

and the unsatisfied demand *DU*(*t*) in the period of time *t* is

$$D_U(t) = D(t) - D_S(t).$$

- Let us further denote c_1, $c_1>0$, storage costs for one unit.

- Let us denote c_2, $c_2>0$, costs connected with unsatisfied demand.

- Finally let c_3, $c_3>0$, be costs connected with the new order and its subsequent supply.

Partial storage costs in the current time period *t* are comprised of the costs $c_1Z_k(t)$ for storage $Z_k(t)$ units (holding cost), costs $c_2D_U(t)$ expressing the price of unsatisfied demand (stock out cost) and finally the costs $c_3O_n(t)$ for the realization of new delivery (order cost). For the costs in the period *t* the sum $c_1Z_k(t)+c_2D_U(t)+c_3O_n(t)$ can be written. The total storage costs for the whole period of time *T* can be expressed by the relation

$$C=\sum_{t=1}^{T} c_1Z_k(t)+c_2D_U(t)+c_3O_n(t).$$

Implementation of the Model

For the aforementioned process it is necessary to prepare a simulation model. On its basis we can observe the qualities of the described process then. For the final implementation we use software MATLAB. Function function[C]=supply(Z0,R) was written. Its inputs are inventories at the beginning of the current period of time Z0 and the reorder point R. Its output is the searched total storage costs C. The key part of the algorithm is set in the following listing (the text after symbol % is the commentary).

```
for t=1:T
   Z0=Zk;                                  % beginning supply
   if t==T_dod
      Q=d;
      On=0;
   else
      Q=0;
   end                                     % beginning delivery
   Z0=Z0+Q;                                % supply in current period
   u=rand();                            % distribution of the demand
   D=distribution(u);
   DS=min(Z0, D);                          % satisfied demand
   Zk=Z0-DS;                               % final supply in the period
   DU=D-DS;                                % unsatisfied demand
   if (On==0 && Zk<=R)
      On=1;
      new_claim=1;
      u=randi([1 3]);
      T_dod=t+u+1;                % period of new delivery
   else
      new_claim=0;
   end
   C=C+c1*Zk+c2*DU+c3*new_claim;   % increasing of costs
end
```

The random variable *D* characterizing the demand concerning the stored product is firstly generated by the generator of pseudo random numbers rand() with uniform distribution within the interval [0, 1]. Then the method of inverse transformation, cf. Winston (2003) and Prazak (2015), is used and the uniform distribution is transferred to the real distribution of demand. The discrete uniform distribution characterizing the period of time *U* concerning the supply of new inventory delivery can be generated by function randi() in MATLAB.

Simulation and its Results

For simulation we used the following values: T=25, i.e. we count with 25 working days, the initial value of the inventories at the beginning of the planned period of time is Z_0=7, i.e. 7 units. The distribution characterizing the demand is described in the following Table 1.

Table 1: Demand distribution

Demand *D* in pcs	0	1	2	3	4	5
Probability	0.05	0.10	0.20	0.40	0.15	0.10

Let us also assume that the value of one supply is constant and the value is d=10 pieces. For unit cost (in money units) we considered values c_1=0.02, c_2=8 a c_3=20. We are interested in minimal expected costs E($C(R)$) for the inventory control with respect to reorder point R, where R∈[1:20]. This task can be formally written as argmin{E[$C(R)$]| R∈[1:20]}.

Provided we use the described simulation model which is replicated e.g. 1000 times we find out that optimal value of the reorder point is R=11. For this value we found the following descriptive statistics where values are set in money units, see Table 2.

Table 2: Results of simulation

average costs	median costs	mode costs	standard deviation	1Q costs	3Q costs
184	179	144	29	164	202

The graphical presentation of the obtained cost distribution can be found in Figure 1. Provided the values of parameters are changed in the prepared model, or other probability or time for delivery is set, we get the relevant simulation which corresponds with the new conditions. This universality of the prepared model enables to simulate a variety of particular situations concerning inventory control.

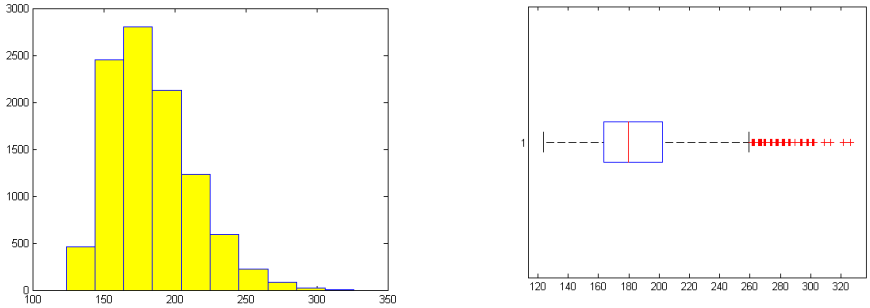

Fig 1. Histogram and boxplot of inventory costs gained with simulation model of inventory control. Source: Own computation and arrangement with MATLAB.

Conclusion

In the paper we characterized the probability model for inventory control. We supposed that the demand and the time delivery of the new supply are discrete random variables with known probability distribution. The prepared model was used for simulation which enables us to find the

probability cost distribution of inventories for the relevant period of time. On the basis of the parameter change which characterizes the reorder point we stated the optimal value of this parameter according to the size of expected value of storage costs. The described simulation leading to the storage cost optimization can be extended to another parameter for which the optimal value can be looked for. In the described model it could be e.g. the parameter that characterizes the size of one delivery. This will be the objective of our next work.

Study on the Dynamic Factors of Qingdao Industrial Transformation and Upgrading

Xu Lixun, Qingdao University of Science and Technology, China, xlx@qust.edu.cn

Xu Panpan, Qingdao University of Science and Technology, China, qustxupanpan@163.com

Abstract

By setting up an industrial growth model based on classical growth theory, this paper studies the dynamic factors of Qingdao industrial transformation and upgrading by analyzing the main influence factors of Qingdao GDP. Qingdao should transform and upgrade industries by the innovation of science and technology, enlarging consumption and promote international trade.

Keywords: Dynamic factors, Industrial transformation and upgrading, Econometric model, Principal component analysis

I Introduction

During the period of "the 12th Five Year" Plan, the GDP growth rate of Qingdao has decreased beneath 10%, which shows a downward trend since 2005. With the speed of economy development slows down, the structure of economy also adjusts at the same time. The 3rd industry became the main part of GDP and exceeded the 2nd industry first time in 2011, and the gap between these two industries expanded in the next two years. According to the above changes of economic indicators, it's apparently showing that Qingdao has its anther round of industrial transformation and upgrading. Therefore, it is very important to find out the main dynamic factors of Qingdao industrial transformation and upgrading, which will strongly support "the 13rd Five Year" Plan.

As GDP is the main economic indicator of macroeconomic, and it is influenced by social production, consumption and the investment, this paper starts from the dynamic factors that affects GDP of Qingdao in order to analyze the target and dynamic mechanism of Qingdao industrial transformation and upgrading [a].

II Selection and Design of Model

This paper sets up an industrial growth model based on classical growth theory. Then this paper collects data from 2006 to 2013[b]. In this model, GDP is the dependent variable and the economic development factors are independent variables. The model mainly analyzes endogenous dynamic factors which promote industrial transformation and upgrading. Construction of the model is as follow:

$G=F(X_1, X_2, X_3, X_4, X_5, X_6, X_7, X_8, X_9)$
G represents gross domestic product of Qingdao.
X_1 represents the per capita disposable income of urban residents of Qingdao.
X_2 represents per capita disposable income of rural residents of Qingdao.
X_3 represents total wages of staff of Qingdao.
X_4 represents retail sales of social consumer goods of Qingdao.
X_5 represents productive fixed assets investment of Qingdao.
X_6 represents unproductive fixed assets investment of Qingdao.
X_7 represents the total amount of foreign trade imports and exports of Qingdao.
X_8 represents social employed population of Qingdao.

X_9 represents research and development funding of Qingdao.

After natural logarithm processing of data, we obtain the correlation matrix which is shown in Table I by SPSS.

Table 1 Correlation matrix

	LNX_1	LNX_2	LNX_3	LNX_4	LNX_5	LNX_6	LNX_7	LNX_8	LNX_9
LNX_1	1.000	.998	.992	.999	.986	.976	.947	.997	.981
LNX_2	.998	1.000	.997	.995	.991	.972	.953	.995	.978
LNX_3	.992	.997	1.000	.986	.997	.957	.947	.988	.964
LNX_4	.999	.995	.986	1.000	.981	.982	.936	.996	.985
LNX_5	.986	.991	.997	.981	1.000	.949	.930	.979	.957
LNX_6	.976	.972	.957	.982	.949	1.000	.902	.984	.990
LNX_7	.947	.953	.947	.936	.930	.902	1.000	.940	.929

LNX_9	.981	.978	.964	.985	.957	.990	.929	.985	1.000

Table 1 represents that the relevance of factors is large. We extract the main factors by principal component analysis and we obtain the results which are shown in Table 2 and Table 3 [c].

Table 2 The total explanatory variance

	Eigen value	Difference	Proportion	Cumulative	Difference	Cumulative
1	8.784	97.603	97.603	8.784	97.603	97.603
2	.118	1.310	98.913			
3	.072	.805	99.717			
4	.014	.151	99.868			
5	.007	.080	99.948			
6	.004	.041	99.989			
7	.001	.011	100.000			
8	1.001E-013	1.014E-013	100.000			
9	-1.000E-013	-1.004E-013	100.000			

Table 3 Coefficient matrix of component score

Factor	Component
	1
LNX_1	0.114
LNX_2	0.114
LNX_3	0.113
LNX_4	0.113
LNX_5	0.112
LNX_6	0.112
LNX_7	0.109
LNX_8	0.114
LNX_9	0.112

We can see from Table 2 that cumulative contribution rate of the first Eigen value is 97.603%, which means the first principal component represents 97.603% information of the original nine factors. We can get the relationship between the first principal component and the original variables:

$$Z = 0.114LNX_1 + 0.114LNX_2 + 0.113LNX_3 + 0.113LNX_4 + 0.112LNX_5 + 0.112LNX_6$$
$$+0.109LNX_7 + 0.114LNX_8 + 0.112LNX_9$$

III Parameter Estimation and Test

We create a linear equation between *Z* and *LNGDP* by Eviews5.0.

It is assumed to be: $LNGDP = C + \alpha Z$

1.Heteroscedasticity test:White test

Table 4 White test

White Heteroskedasticity Test:

Log likelihood	12.62074	F-statistic		2097.431
Durbin-Watson stat	1.200884	Prob(F-statistic)		0

Data from the Table 5 indicate that $R^2 = 0.997, DW = 1.200884$ and Table V represents degree of fitting is quite high in the econometric model. We can get $d_L = 0.763, d_U = 1.332$ by checking DW statistics for a model with eight samples and an explanatory variable. We cannot determine whether there is autocorrelation for $d_L < DW < d_U$ in this model.

The residual plot (Fig 1) shows that there is a systematicmode about the residual changes and the residual changes are continuously positive and continuously negative, which indicates that there is a positive autocorrelation.

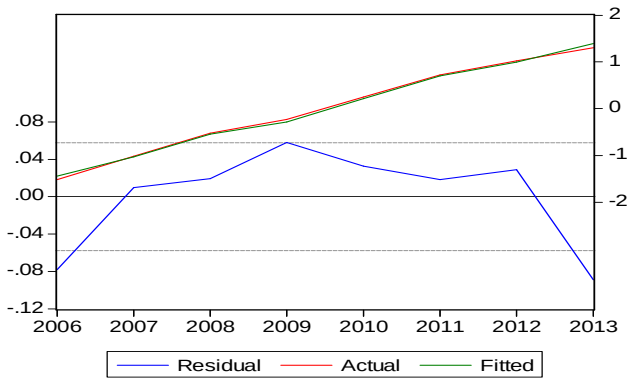

Fig 1. Residual plot

To eliminate autocorrelation of the model, we set up a generalized difference model by Durbin method:

$$LNGDP_t = \beta_1(1-\rho) + \beta_2 Z_t - \rho\beta_2 Z_{t-1} + \rho LNGDP_{t-1} + v_t$$

The above equation is a multiple regression model and we estimate the parameters by ordinary least squares method (OLS).The results are shown in Table 6. Table 6 represents that the regression coefficient of $LNGDP(-1)$ is 0.761525, and we regard it as an estimated value of ρ .

Table 6: the estimated value of parameters in generalized differential equation by OLS (1)

Dependent Variable: LNGDP Method: Least Squares Sample (adjusted): 2007 2013 Included observations: 7 after adjustments				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	0.086409	0.075869	1.138915	0.3375
Z	0.762584	0.191493	3.982305	0.0283
Z(-1)	-0.57819	0.51984	-1.112244	0.3471
LNGDP(-1)	0.761525	0.535784	1.421328	0.2503
R-squared	0.998806	Mean dependent var		0.217
Adjusted R-squared	0.997612	S.D. dependent var		0.85247
S.E. of regression	0.041656	Akaike info criterion		-3.22316
Sum squared resid	0.005206	Schwarz criterion		-3.254069
Log likelihood	15.28106	F-statistic		836.5737
Durbin-Watson stat	1.647296	Prob(F-statistic)		0.00007

Dependent Variable: LNGDP-0.761525*LNGDP(-1)
Method: Least Squares
Sample (adjusted): 2007 2013
Included observations: 7 after adjustments

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	0.082507	0.025164	3.278784	0.022
Z-0.761525*Z(-1)	0.772068	0.061459	12.5623	0.0001

R-squared	0.96929	Mean dependent var	0.35897
Adjusted R-squared	0.963148	S.D. dependent var	0.168179
S.E. of regression	0.032285	Akaike info criterion	-3.793451
Sum squared resid	0.005212	Schwarz criterion	-3.808905
Log likelihood	15.27708	F-statistic	157.8113
Durbin-Watson stat	1.676782	Prob(F-statistic)	0.000057

The regression equation $LNGDP^* = 0.083 + 0.772Z_t^*$

can be obtained, where $LNGDP_t^* = LNGDP_t - 0.761525LNGDP_{t-1}, Z_t^* = Z_t - 0.761525Z_{t-1}$

We get $d_L = 0.700, d_U = 1.356$ by checking DW statistics with 5% significance level. In this model, $d_U < DW < 4 - d_U$ indicates that generalized differential model is no longer autocorrelative, and the coefficient of determination R^2 and statistics t, F reach the ideal level [e].

According to the test results, $\beta_1 = \frac{0.083}{1 - 0.761525} = 0.348$ and the modified model is:

$$LNGDP = 0.348 + 0.772Z = 0.348 + 0.088LNX_1 + 0.088LNX_2$$
$$+0.087LNX_3 + 0.087LNX_4 + 0.086LNX_5 + 0.086LNX_6$$
$$+0.084LNX_7 + 0.088LNX_8 + 0.086LNX_9$$

We seek geometric mean about the annual growth rate of each factor. The definition of pulling degree to GDP is the product of geometric average growth rate and elastic coefficient of the modified model. We divide the geometric average growth rate of GDP by the pulling degree to GDP to get the contributions to GDP. The pulling degrees and contributions to GDP are shown in Table 7.

Table 7 The pulling degrees and contributions of factors to GDP

Factors	Average growth rate	Elastic coefficient	Pulling degree to GDP	Contribution to GDP
GDP	13.7 %	——	——	100%
Per capita disposable income of urban residents	12.4 %	0.088	1.1 %	8.0 %
Per capita disposable income of rural residents	13.1 %	0.088	1.2 %	8.8%
Total wages of staff	15.5 %	0.087	1.4%	10.2%
Retail sales of social consumer goods	16.4 %	0.087	1.4 %	10.2%
Productive fixed assets investment	17.8 %	0.086	1.5 %	10.9 %
Unproductive fixed assets investment	16.1 %	0.086	1.4 %	10.2%
Total amount of foreign trade imports and exports	11.2 %	0.084	0.9 %	6.6%
Social employed population	2.2%	0.088	0.2 %	1.5%
Research and development funding of Qingdao	25.5%	0.086	2.2 %	16.1 %

IV Conclusion

1.The first contribution of GDP is the factor of research and development funding, which is 16.1% as the top. This indicates that technology is the main driving force of economic development of Qingdao industries and Qingdao depends strongly on technological innovation.

2.The contribution of productive fixed assets investment to GDP is 10.9% and the contribution of unproductive fixed assets investment to GDP is 10.2%,which indicates that Qingdao industrial transformation and upgrade has a strong dependence on investment and supplying, and this situation would make serious challenges to the economic development model of Qingdao.

3.The contribution of foreign trade to GDP is 6.6%,which means foreign trade has a certain influence on GDP. Meanwhile, the factor of Social employed population is only 1.5%, which shows this has a very low influence on the development, which means Qingdao labor intensive industry is not the main body.

According to the above analysis, we can draw a conclusion that Qingdao should expand the investment on R&D to strengthen Hi-tech factor influence, which will be the main dynamic factors of industrial transformation and upgrading. Meanwhile，consumption is also another trigger of economic development, and Qingdao should promote consumption to increase the speed of transformation. Finally, Qingdao should enlarge foreign trade contribution, by which it can not only promote international industry development but also become another dynamic factor of industrial upgrading.

A Country under Siege: Reflection of Identity Crisis on the Formation of Public Opinion in Turkey

Banu Baybars Hawks, Professor, Kadir Has University, Istanbul, Turkey, banubhawks@khas.edu.tr

Abstract

To date, academic attention in social sciences remains inadequate with regard to research and analysis of public opinion in Turkey. Most of the existing research has assessed the public opinion during political election periods. Therefore, it is of great interest to find out what the public thinks about current issues in the country, and how to interpret the results to be able to reveal whether they may have any reflections on social, political, and cultural structure of the country. The current study aims to fill this gap. *The research on political and social trends in Turkish public opinion* has been conducted since 2010 by Kadir Has University Turkey Research Center. The survey's objective is to reveal public opinion on the most important current issues in the country, the economy, terror, the Kurdish Issue, domestic and foreign policies, the judicial system, democracy and the media, and, social relations/life in Turkey. The data was collected via face to face interviews. The sample included 1000 respondents, representative of the country's population, aged 18 and above, residing in the city centers of 26 cities in Turkey.

Keywords: Public opinion, politics, media, terrorism, economy, Kurdish issue, Turkey.

Introduction

Turkey has been experiencing one of the worst times in its history. Surrounded by different terrorism threats within and outside of its borders, the country is struggling to find the best answer to the question of "how to deal with terrorism." Terrorism is defined as "the unlawful use or threatened use of force or violence by a person or an organized group against people or property with the intention of intimaditing or coercing societies or governments, often for ideological or political reasons" (*dictionary.com*). The victims are anonymous, and the aim is to cause damage or spread a credible threat. To call an act as terrorism, an average "man on the street" needs to feel uneasy about his security the next day (Leitzinger, 2002).

Terrorism is not a new phenomenon for Turkey since 1984 when the Kurdish Workers Party (PKK) began its armed struggle against the country. Despite the rise and fall of the attacks throughout the years, PKK terror never ended completely. Especially after the second part of 2015, it escalated again as a result of the strategy change of Turkish government from soft methods to the military ways by launching heavy military operations against Kurdish insurgents from the outlawed Kurdistan Workers' Party (PKK). By looking at the general picture of the country, it can be easily seen that terrorism is a number one problem not only in political agenda also in public agenda.

The research and analysis of public opinion academically regarding the important agenda items of one country outside of election periods are very rare. This argument is also valid for Turkey. In order to understand how the social and political systems and policies of the country function, there is a need for an empirical assessment of recent trends in Turkish public opinion. Accordingly, this study seeks to fill the gap in the social sciences literature in English regarding Turkey's social and political stand which may be perceived to be very different by other nations (Baybars Hawks 2014, 1). The timely feedback taken from public surveys is important not only yielding important insights into public's opinion about the current agenda in Turkey, but also in shaping of public policies. The information gathered further enlightens us on why and how some problems exist in a particular society.

"The research on political and social trends in Turkish public opinion" has been conducted since 2010 by Kadir Has University Turkey Research Center, where the author works as the coordinator. For the first two years, the method of data collection was CATI (computer-based telephone interviews). Since 2012, the data has been collected via face to face interviews. For the years of 2012, 2013, 2014, and 2015, the sample included 1000 respondents, representative of the country's population, aged 18 and above, residing in the city centers of 26 cities in Turkey. In analyzing data from the "Social and Political Trends in Turkey research", my hope is to develop a new insight in understanding of Turkish public opinion and its underlying factors.

Literature Review

It is important to know how and by whom the public is itself influenced. Diffusion studies center on the process of message adoption and examine the roles of intervening steps and conditions "which increase or decrease the likelihood that a new idea, product, or practice will be adopted by members of a given culture" (Diffusion of Innovations Theory, 2010). According to Watts and Dodds, "[a] central idea in...diffusion research is that influentials—a minority of individuals who influence an exceptional number of their peers—are important to the formation of public opinion" (2007, p.441). "A person evaluates a new idea and decides whether or not to adopt it on the basis of discussions with peers who have already adopted or rejected the innovation"(Rogers & Shinghal, 1996, p.410). This dependence on peers underlines the role of opinion leaders in the innovation diffusion process.

Opinion leaders influence the opinions of audiences via personal contact, 'but additional intermediaries called change agents and gatekeepers are also included in the process of diffusion.' (Diffusion of Innovations Theory, 2010) Besides opinion leaders and other intermediaries, news commentators, presidents, political party leaders and special interest groups also have the power to shift public opinion, which has substantial proximate effects on policymaking.

Diffusion is defined as a process by which either an innovation or information is communicated through certain channels over time among members of a social system (Rogers 1983, p.5). Opinion leaders are initiators of the diffusion of a new idea or practice. The degree of influence exercised by an opinion leader is predicated in part on the potential adopters' assesment of his or her credibility and trustworthiness. Opinion leaders have more credibility with decision-makers because of an established relationship. Although the mass media may be used as a tool, more direct and personal communications may be used to reach opinion leaders, who in turn influence the decision makers.

Public opinion has substantial proximate effects upon policymaking. Government policies are judged according to their foreseen costs and benefits for the public. Since there is great uncertainty about the effects of policies, the expected utility of a particular policy alternative depends upon beliefs about present and future facts and causal relationships. For this reason, "new information that modifies relevant beliefs can change the expected utility for citizens" (Page et al. 1987, p.23-24). And, if the conditions below are "met in the same way for many individuals, there may be a change in collective public opinion..." (Page et al. 1987, p.23-24). These conditions are: If the information is 1) actually received, 2) understood, 3) clearly relevant to evaluating policies, 4) discrepant with past beliefs, and 5) credible (Page et al. 1987, p.23-24).

Agenda-setting is described as the process in which the perceptions of a given issue are shaped by the mass media, the public, and/or policy elites. Following McCombs and Shaw's pioneering study during 1972 American presidential election period, agenda-setting has been heavily researched and more than 500 research articles have been published on the issue by making the field extremely prominent in mass communications. In the past, researchers have been more inclined to focus on what shapes the public agenda, treating the media agenda as an independent variable in that process. Recently, however, they have begun to carry out studies focusing on who and what shapes the news agenda and have thus taken the media agenda as a dependent variable.

On the other hand, according to the agenda-building perspective, not only mass media and policymakers, but also social process which involves mutually interdependent relation between the concerns generated in social environment and the vitality of governmental process carries

importance. Cobb and Elder state " the agenda-building framework makes allowances for continuing mass involvement and broaden the range of recognized influences on the public policy-making process" (1971, p.912).

The advent of the Internet has increased the role of citizens in the agenda-setting process, making everyone as both the reader and reporter of the news. According to Lee, Lancendorfer and Lee (2005, p.59), "various opinions about public issues are posted on the Internet bulletin boards or the Usenet newsgroup by Netizens, and the opinions then form an agenda in which other Netizens can perceive the salient issue." Within this context, the Internet plays role in forming Internet user's opinion as well as the public space. Research on Internet mediated agenda-setting (Kim and Lee 2006, p. 175) revealed 'reversed agenda effects', " meaning that public agenda could set media agenda.

Research Design and Methodology

Knowing the importance of public agenda in the agenda-setting and agenda-building processes, this paper seeks to reveal the current social and political trends in Turkish public opinion. For that purpose, a survey was carried out in December of 2015 to determine these trends in Turkey for that same year.The subjects for the study, which utilized a questionnaire in one-on-one interviews, included 1,000 individuals aged 18 years and older from 26 cities representing the general population. A stratified random sampling frame was used.

The topics covered by the survey were; the most important current problem in Turkey; the Economy; Terror; Approaches to the Kurdish Issue; Evaluations of the Government and Opposition Parties; Evaluations of Institutional Efficiency; Foreign Policy; the Judicial System/Constitution; Democracy and the Media; and, Social Relations/Life in Turkey.

In the interviews used for this study, subjects were first asked about their political opinions and ethnic backgrounds. Those who identify themselves as conservatist and religious make up 37 percent of total population, and when compared with previous years, it looks like the conservatism trend has been stabilized around that amount. A decline has been observed in the ratio of nationalists (16.3%) and social democrats (9.4%), compared to 2014.

In response to the question "How do you define yourself ethnically?" 65.7 percent of respondents replied that they were Turkish and 11.1 of them indicated that they were Kurdish. 16.8 percent of population did not know the meaning of ethnic background.

Results

The Most Important Problem of Turkey is "Terror"

In 2015, terror was "the most serious problem in Turkey" according to the majority of respondents. While 13.9 percent of participants indicated terror to be the most serious problem in the country in 2014, this rate went up to 39.3 percent in 2015. Unemployment, seen as the second most important problem in 2015 at 16.3 percent, has fallen significantly from the much higher rate of 33 percent recorded for the previous year.

Economy not going well

According to the survey results, Turkish public does not think that the economy doing well. While in 2014, in response to the question "How did the economic developments of the preceding year influence you?" 45.3 percent of respondents stated that they were negatively affected, this rate has increased to 53.2 percent this year. Only 5.3 percent of respondents stated that they were in economically good shape. Last year this rate was found to be 7.1 percent. In addition to this, 67.4 percent of the survey respondents state that the Central Bank of Turkey should be independent of politics.

"*Fight against PKK is unsuccessful, Turkey may be divided*"

According to the survey, in 2015 there is a more balanced approach towards solving terrorism problem. Last year, 39.2 percent of respondents stated that military methods were the most effective way to solve this problem, this year however, the same response has fallen to 31.6 percent. The ratio of respondents who regard political measures as being the best remedy for terror has remained unchanged since the previous year at 30.9 percent. This year, options such as culture policies and economic measures seem to come to the fore more than in previous years.

When asked about the government's performance in the fight against the PKK, 45.8 percent of respondents stated that they found the government's performance to be unsuccessful.

Moreover, the survey results reveal that the rate of those who regard Turkey as being in danger of being divided has increased. In response to the question "Do you think Turkey is under the threat of being divided?" 54.2 percent of participants said "Yes." In 2014, this rate was 46.2 percent. When this result is evaluated in terms of political party allegiance, regions and ethnic background, the perception that Turkey is in danger of being divided appears to be the common perception across Turkey.

The percentage of respondents describing ISIS as a terror group and perceiving it as a threat to Turkey has also fallen. Those who describe ISIS as a terror group decreased from 93.2 to 86.4 percent since last year. While in the last survey, 82.3 percent of respondents described ISIS as a threat to Turkey, this rate has decreased to 78 percent this year. 54.1 percent of respondents agree that direct and intensive air strikes should be carried out against ISIS. Moreover, 45.1 percent of participants believe that the recent bomb explosions in Diyarbakır, Suruç and Ankara were "carried out by ISIS alone" and 50.2 percent think that "ISIS was responsible for these events."

The research also reveals that there is a rise in the percentage of people who perceive the government's actions on the Kurdish issue to be successful. While this approval rate was 25 percent in the previous survey, it increased to 29.9 percent this year. There was also a decline in the percentage of respondents who perceive the government's approach to solving the Kurdish issue to be unsuccessful: while this disapproval rate was 47.7 last year, it decreased to 40 percent in the new survey. The 19.1 percent who approve of the government's approach to solving the Kurdish issue do so because they find "The government to be successful in the negotiation process", while the 36.8 percent who find the government's approach to be unsuccessful, state "terror has not ended in all these years" as the grounds for this opinion.

Does the Peoples' Democratic Party (HDP) represent Kurds, and do Kurds want Independence?

When asked whether they thought the Kurdish people were represented by the Peoples' Democratic Party (HDP) and the PKK, the percentage of participants who believe that the HDP represents the Kurdish people was found to be 32.2 percent, while those who believe that the HDP does not represent the Kurdish people was found to be 35.3 percent.

Public's perspective on the PKK's representation of Kurds is as follows: 19.9 percent of respondents believe that the PKK represents Kurdish people, while 52 percent think it does not. 52.8 percent of participants approve of education being provided in the mother tongue, while 47 percent of respondents suggested "Islam" as the main bond connecting Kurds and Turks to each other. 53 percent of respondents expressed a desire for the negotiation process to restart.

The survey also reveals that 64.6 percent of respondents support a unitary state, while 32.6 percent of respondents believe that Kurds desire an "Independent Kurdish State."

Everyone finds his/her own political party and its leader to be successful

The study shows that most of the respondents consider the parties and party leaders they vote for to be successful.

Thus, 42.3 percent of survey participants consider the Justice and Development Party (AKP), 25.9 percent the Republican People's Party (CHP), 13.5 percent the Peoples' Democratic Party (HDP) and 11.2 percent the Nationalist Movement Party (MHP) to be successful. When this question is asked based on the parties the respondents voted for; 65 percent of AKP, 56.3 percent of MHP, 45.6 of CHP and 43.2 of HDP voters consider their parties to be successful.

When it comes to judging leaders' success, the percentage of respondents who describe the following leaders as successful is as follows: AKP's leader Ahmet Davutoğlu 42.3 percent, CHP's leader Kemal Kılıçdaroğlu 25.5 percent, HDP's leader Selahattin Demirtaş 14.9 percent, and MHP's leader Devlet Bahçeli 10.9 percent. This year the percentage of respondents who consider the President Recep Tayyip Erdoğan to be successful is 43.6 percent, while those who consider him to be unsuccessful is 40.7 %. It is worth mentioning that last year 35.9 percent of respondents considered him to be unsuccessful.

The Military is once again the Most Trusted Institution

According to the survey results, the Turkish Armed Forces (TSK) were once again the most trusted institution. While 62.4 percent of respondents stated that they considered the TSK to be successful, police forces were the second most trusted institution at 51.9 percent and universities were third at 49.8 percent. The least trusted institutions were the presidency of Turkish Parliament at 31.8 percent, the media at 27.8 percent and political parties at 33.9 percent.

No support for 'Beştepe' and the Presidential System

When asked whether they approved the Presidential Office being moved from Çankaya to the Presidential Complex in Beştepe, 44 percent of respondents stated their disapproval.

75.4 percent of survey participants stated that the Presidential Office should be neutral.

When asked "What do you think the administrative system of the country should be?" 68,9 percent of respondents stated their preference for "parliamentary democracy". Despite a 10 point increase from the last year, support for a Presidential system remained low at 22.1 percent. 32.2 percent of participants gave as their main reason for not wanting a presidential system the possibility that this would "increase the polarization of society" and 27.1 percent of participants thought a presidential system would lead to "one-man rule."

*Belief in the existence of a 'Parallel Structure' has decreased*Belief in the existence of a parallel state structure within the state has fallen to 43.5 percent of respondents. 63 percent of participants stated that they found the government's fight against the parallel structure to be adequate, while 73.8 percent approved of the methods used to fight the parallel structure.

Support for the European Union continues to fall

While 71.4 percent of respondents supported the EU in 2014, this rate decreased to 65.1 percent this year. There has been a sharp fall in the belief in the possibility of Turkey's EU membership with a decrease from 45.1 percent to 38.3 percent since the last survey. Similarly, the percentage of those who support the continuation of Turkey's NATO membership, which was 76.2 percent last year, has fallen to 69.5 percent in this survey.

Russia is the Most Threatening Country

Although Israel had been at the top of the list of countries thought to "pose the biggest threat to Turkey" since 2011, this year the Russian Federation replaced Israel on this list. The percentages of those who consider the USA, Syria and Israel to pose a threat to Turkey have fallen in 2015.

The Government's Syria Policy is unsuccessful

In 2015, the percentage of respondents who find the government's Syria policy to be completely successful or successful was 29.5 percent, while 50.3 percent consider it to either be unsuccessful or completely unsuccessful. 46.5 percent of people expressed a preference for "being neutral and not intervening."

In the survey, when questioned about the policies Turkey should apply towards refugees, 56 percent of participants stated that Turkey should stop taking more refugees.

78.5 percent of participants stated approval for Turkey's downing of a Russian warplane in Syria in order to protect its borders.

Turkey is changing for the better

In the research, opinions towards changes Turkey is undergoing were also questioned and 63.4 percent of participants stated that they consider Turkey to be a changing country and the percentage of those who believe Turkey is changing for the better has increased from 55.7 percent in 2014 to 60.4 percent in 2015.

Happiness Rates are Falling

When participants were asked about their level of happiness for living in Turkey, it was observed that the percentage of those stating that they were very happy or happy to be living in Turkey has fallen from 60.7 percent to 48 percent since the last survey, while those saying that they were unhappy or very unhappy rose from 19.7 percent to 25.7 since last year.

Conclusion and Discussion

As a result of the changes in technology, there have been major changes in the ways in which people receive their news. Now people search for news in different ways, and therefore, the media and its agenda have to be harmonized. Although the basic assumptions of agenda setting theory have kept their importance with the changes of new media, an aspect of agenda setting theory has changed. This change is called "Agenda Melding" which focuses "on the personal agendas of individuals vis-à-vis their community and group affiliations"(McCombs 2006, 142). "This means that individuals join groups and blend their agendas with the agendas of the group. Then groups and communities represent a "collected agenda of issues" and "one joins a group by adopting an agenda." On the other hand, agenda setting defines groups as "collections of people based on some shared values, attitudes, or opinions" that individuals join" (Ragas and Roberts, 2009, p. 46). In other words, in the past people would learn and adopt the agenda of the group in order to belong. Now with the rapid changes in the access of media, people first form their own agendas and then find groups that have similar agendas that they agree with. The technological advancements have made agenda melding easy for people to develop because there is a wide range of groups and individual agendas. With the advent of the Internet, it became possible for people all around the globe to find others with similar agendas and collaborate with them" (Ragas and Roberts, p.47).

Agenda melding studies intersect with information diffusion. Developments in communication technologies have also created new channels for information dissemination, as they brought up fresh perspectives to agenda setting theory. These developments have triggered new questions about the spread of ideas and policy change.

As the findings of this study reveal, whether or not a policy innovation is adopted depends on how the politics of ideas and how policy debates are shaped in specific contexts. The information diffusion process "tends to rely upon networks of actors sharing similar interests and concerns, who trade in ideas, and whose efforts to shape and structure policies to fit specific contexts constitute what we have come to think of as the politics of ideas" (Mintrom and Mossberger2008).

Under the ruling of AKP, the agenda items have been quickly changing in Turkey, and the public was not able to grasp and understand them. As a result, as indicated in the findings of the survey, the

public did not have concrete opinions on issues such as solution to the terror problem, the Kurdish issue, and Turkey's foreign policy. There is a break in the information diffusion process between the reception and understanding phases. Because of the rapid changes in the political and media agendas, the powerful political actors in Turkey were able to mobilize the public in the directions they desired on certain issues. At this point, there was no surprise to see 10 point increase in support of the presidential system, compared to 2014. President Recep Tayyip Erdoğan has been very successful alone to lead the public opinion on that issue. It can be even speculated that he is the most powerful actor in Turkey that sets the political, media, and even the public agendas regardless of whether the media covers, voluntarily or involuntarily, what the government wants.

Turkey is becoming a polarized society in many respects. The research findings indicate that the majority of respondents do not want live with others different than themselves politically, ethnically, culturally, in addition with others from different religions and different gender preferences. Most of the participants are also in dilemma regarding whether Turkey is western or eastern country. The same dilemma also exists in the perceptions of whether the country belongs to Europe or Middle East, it is a modernized or underdeveloped country, and whether the Turkish society is religious or a secular society. The survey results point out the equal segmentation (50/50) in the population holding the one side of these beliefs. Although there reveals a consistent trend in public opinion about certain issues for the last five years of the survey, on most others, the public opinion has also been changing, in a country experiencing an identity crisis.

Abstract

The 4th Malaysian Population and Family Study by the National Population and Family Development Board (1), which was matched with the result of the population and housing census in 2010 found that about 23%, or 538,000 of the 2.4 million senior citizens in Malaysia suffered from the 'empty nest' syndrome. A report issued by the UN Development Programme (UNDP) stated that 90% of the contributors towards the Employees Provident Fund (EPF) in Malaysia did not even have enough money to live a simple lifestyle for a period of five years after retirement. United Nation projected that the country will achieve the status (ageing country) in year 2030. Malaysia in an upper middle-income country and as of 1 January 2016, the population of Malaysia was estimated to be 31,127,247 people. This is an increase of 1.58 % (482,954 people) compared to 30,644,293 people the year before. In 2015, the natural increase was positive, as the number of births exceeded the number of deaths by 494,905. Due to external migration, the population declined by 11,951. The sex ratio of the total population was 1.029 (1,029 males per 1,000 females) , which is higher than the global sex ratio. The global sex ratio in the world was approximately 1,016 males to 1,000 females as of 2015.(2) This paper analyses the Malaysia government's policies and protections in overcoming ageing society and preparing to support and assist the ageing population by 2035. The researcher uses doctrinal research methodology and secondary statistic from the authorities for this research to gather the data and examining the policies. Interestingly, despite the policies and protections suggested and implemented by the government, there are still much more the government needs to do to overcome the challenges faced by the ageing society in Malaysia.

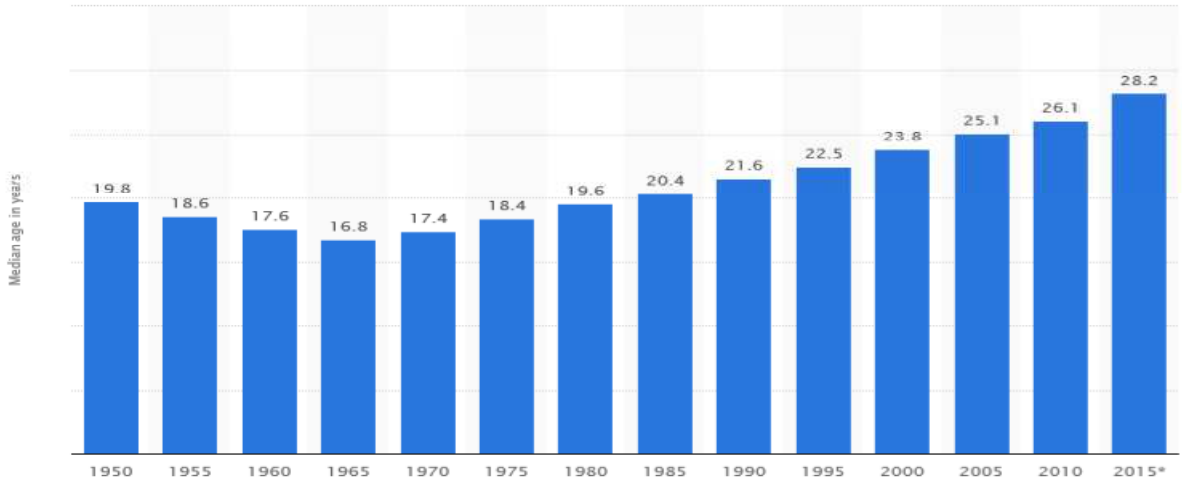
Keywords : Ageing Society, Policies, Protections

1. Introduction

Department of Statistic (DOS)(3) Malaysia, estimates that in 2015, the proportion of the Malaysian population aged 60 years and older is 9.1% outnumbering the proportion of children younger than five years old by 0.6%. Even though, this may seem like a small difference, the gap between the two age groups is set to increase continuously and dramatically over the next three decades. This is a reflection of the phenomenon known as population ageing, defined by the United Nations (UN) as "the process by which older individuals become a proportionally larger share of the total population." According to the National Population and Family Development Board (LPPKN), based on projections made by DOS, Malaysia is expected to reach ageing population status by the year 2035, at which point 15% of the total population will be 60 years and older.

The key challenge for Malaysia is managing and planning for the ageing society. By 2030, 15% of Malaysian population will be above 60 years of age. This indicates that Malaysia's government has to ensure decent employment as well as awareness programmes and services for the young, while at the same time, providing necessary assistance of life options for the elderly. The changes and increasing life expectancy, the economic development and the challenging of family relationships pose a number of challenges, especially in financial sustainability, adequacy of retirement incomes, healthcare financing, care and support and social security for the elderly population.

Average age of Malaysia population from 1950 to 2015(4)



Source: http://www.statista.com/statistics/318690/average-age-of-the-population-in-malaysia/ (7th August 2015).

An increasingly large proportion of global elderly, especially in developing nations, as continued pressure is put on limiting fertility and decreasing family size. Traditionally, elderly care has been the responsibility of family members and provided within the extended family home. Currently, modern societies, state or charitable institutions are now providing elderly care. These changes are due to decreasing family size, the greater life expectancy of elderly people, the geographical dispersion of families, and the tendency for women to further their education and work. Malaysia is facing the same challenges and obstacles like any other aging society. Such as in the case for Japan, their life expectancy is about 83 years. In many ways, the requirements of senior citizens are similar to what disabled people need. Disability experts mention that accessible public facilities in developed countries such as Japan and Singapore were established for the ageing population rather than for disabled people. With that in mind, and observing that disabled people are facing great difficulty in society, Malaysia is currently not ready to cater to the needs of senior citizens by any measure.

Notwithstanding that, it is not insolent to cast doubts on the determination of the government in preparing the country for an aged population. Like disabled people, senior citizens needing the convenience of accessible facilities are facing difficulties now. If the situation remains unchanged, many more will experience exclusion 20 years down the road.

2. Policies Proposed

2.1. The revised National Policy for Older Persons (2010-2015) outlines 6 strategies (5) to empower the individual, family and the community towards improving the well being of the older Malaysian through improving the efficiency and effectiveness of the programmes.

2.2 The UNFPA (United Nations Population Fund) Country Programme for 2013-2017, is consistent both with the national priorities of Malaysia as delineated in the 11th Malaysia Plan.(6) The Government of Malaysia began the first cost-sharing arrangement with UNFPA in July 2003. The four specific outcome areas within the 11th Malaysia Plan are, namely:

a. The five-year plan reaffirms the government's commitment to the people, and the belief that growth cannot be measured by economic success alone.
b. The plan reckons that the well-being of the rakyat and a commitment inclusive and sustainable growth are necessary hallmarks of an advance nation.
c. The Malaysian Well-being Index to increase by 17% per annum, an indicator of improvement in the well-being of the rakyat.
d. Poverty rate dropped to 0.6% in 2014, from 49.3% in 1970.

2.3 A five year Country Programme is proposed in January 2013 to be implemented under a continuing cost-sharing arrangement between Government of Malaysia and the United Nations Population Fund. The cooperation will be based on a systematic situational analysis and country programme assessment and the joint development of a response strategy through this Country Programme Action Plan. Given this context, the Country Programme has addressed the improvement of services of cohesive approach to population dynamics, including the management of the interaction of multidimensional factors in meeting the needs of a country that has both a very young as well as an increasingly aged society/nation.

3. Economy Situation

The Unemployment rate in Apr 2015(7) stayed at 3.0% as the number of jobless fell slightly to 429,000 from 430,800 in Mar 2015, although this was up 5.4% from a year ago when the jobless rate was 2.9%. However, the seasonally adjusted unemployment rate edged up to 3.1% versus 3.0% in Mar 2015. The jobless rate was relatively stable. Despite the unemployment rate is relatively stable at the moment in Malaysia, the government should still monitor the aging factors of the society, whereby it may affect the contribution to the economy by 2035. Hence, the National Policy for the Elderly(8) is a great step forward in preparing the Malaysian society for a transition into an ageing society. One major issue that affects the welfare of the elderly is conspicuously absent from the Policy - social security, which is included as a sub-program. Although health care receives substantial attention, the financing aspect is not covered. The emphasis of the Policy appears to be on social aspects, not denying that these too contribute toward the well being of the elderly.

The author Ong Fong Sim stated in his article,(9) stated “in Malaysia, insufficient retirement savings is a cause of concern. Individuals with no savings or insufficient pension funds will find it financially demanding to get through their old age, especially with the current cost of accommodation, food, medical expenses and other basic items. Dealing with financial problems at an old age will increase stress among those in the age group and prevent them from enjoying their retirement or living in a comfortable life. Challenges that arises as a result of ageing is not limited to senior citizens, rather, it also has consequences to the people surrounding them”. A report published by the United Nations

Development Programme (UNDP)(10) mentioned that 90% of retirement fund contributors did not have sufficient funds to sustain even a simple lifestyle for five years after retiring. In Malaysia (11), formal social protection systems include: the Employees Provident Fund (EPF), 1951, the Social Security Organization (SOCSO) established in 1969, Government pension scheme for Civil servants, Old Age Benefit Scheme for the Armed Forces, and private sector provident and pension funds. These different schemes provide protection for different contingencies such as disability as in the case of SOCSO, old age (pension and EPF) and deaths. "While these schemes provide coverage for the formal sector, the provision is not mandatory for those in the informal sector, which is substantially large in Malaysia. Although EPF is extended to the self-employed on a voluntary contribution basis, the participation rate is low. Those in the informal sector have to rely on savings, drawing down on past wealth and financial support from children to provide them with income security in their old age" (Ong Fong Sim, 2001).

As for Pension, Ong further stated, "it is a non-contributory social security scheme for government employees. Pensions expenditure is wholly borne by the Federal Government through annual allocation from the Federal Budget. It is a pay-as-you-go plan. An employee who has served at least 10 years is entitled to receive a life-long monthly pension upon retirement. The quantum receivable by an employee who has completed at least 25 years of service is half of the last drawn salary. This scheme serves not only as a security for old age, it is designed to provide financial assistance to the dependents of those in the Government service in the event that the government employee passes away while in service or after retirement. The pension also provides compensation to officers who are forced to retire or pass away due to injuries or sickness in the course of performing their official duties. These kind of retirement benefits offered in the pension scheme include service pension and service gratuity which is a lump sum payment granted to a pensionable officer upon retirement. The other type of benefit is in the form of derivative pension, which is granted to the widow/widower/child of a permanent and confirmed officer who dies in service. Derivative gratuity is payable to the widow/widower, child, and mother/dependant father of the deceased or legal personal representative of the deceased officer if the officer dies in service. It is a safety net for the widowed spouses and it is particularly beneficial in providing for the female spouses as they generally experience a higher incidence of widowhood. In terms of coverage, only less than one per cent of the people are protected. In view of the large pension pay out, the government has taken steps to ensure that pensions payment do not become a burden for the government in the future".

"Apart from social security as the primary source of income for the aged, savings, personal life insurance and unit trust funds are alternative forms of sources of protection available to the elderly. The national investment schemes provide attractive returns with the aim to encourage wider participation, particularly, participation from the lower income group. All these are voluntary schemes and hence individual decision is critical in influencing participation.

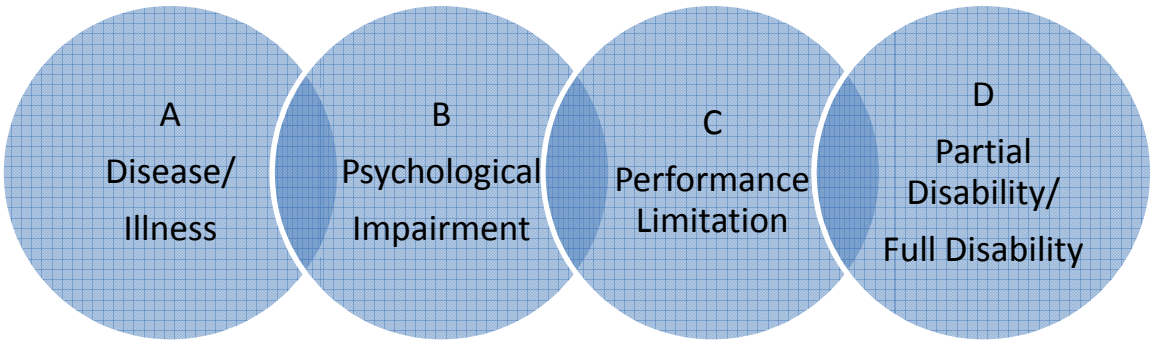
Purchasing an insurance policy is also another alternative toward saving for old age, although it provides protection to other sections of the population as well. Insurance is a way of protection against interruption or elimination of earning capacity of human capital and property resources. It is used as a shield against unexpected expenses that might diminish disposable income available for financial planning objectives including those for retirement. Possessing an insurance policy minimises and ensures against unnecessary economic hardships during ones working life as well as during retirement. No specific insurance scheme is tailored for the elderly at the moment in Malaysia except trust funds recently offered by participating banks" (Ong Fong Sim, Ageing in Malaysia: National Policy and Future Plan, Faculty of Business and Accounting, Universiti Malaya, May 2001).

4. Findings and Recommendations

As stipulated earlier, a country is said to have become an ageing nation when 15%of the population falls into this group. Recent projections estimate Malaysia will achieve that status in 2035. With only 20 years to go, how prepared are we in handling issues related to growing old? Two decades may seem like a long time still, but going by past records, our complacency in the preceding years will come back to haunt us when we pass that threshold without having put the necessary measures in place. In many ways, the requirements of senior citizens are similar to what disabled people need. It

was pointed out by disability experts that accessible public facilities in developed countries in Asia like Japan and Singapore were put in place because of the ageing population rather than for disabled people specifically. With that in mind and seeing that disabled people are facing great difficulty in society, we are currently not ready to cater to the needs of senior citizens by any measure. There are two laws that regulate facilities for disabled people, by-laws 34A and 34B. Senior citizens and the general public can benefit from them as well. What is good for disabled people is good for everyone else. By-law 34A and 34B of the Uniform Building By-laws cover all states in the peninsula. It is a disappointment to see many new buildings and the majority of old buildings within the jurisdiction of the by-laws are still not in compliance with the requirements due to the lack of implementation and enforcement. Like disabled people, senior citizens needing the convenience of accessible facilities are facing difficulties currently. If the situation remains unchanged, many more will experience exclusion 20 years down the road. The rates for private nursing homes start from RM1,200 per month excluding medical treatments and other recurring expenses. The total monthly expenditure can amount to more than RM3,000. This is beyond the means of many senior citizens. There is an urgent need for a better support system that is affordable and one they can fall back on in times of need. Support extended to senior citizens must ensure that their dignity is preserved and a reasonable quality of life assured. After all, they contributed to the nation in their prime. It is not too much to ask that the nation properly provides for them in their golden years should they require it, although currently the government has implemented numerous policies for the betterment of the aged society; however, there are much more to be achieved especially in healthcare and medical financing for the elderly as shown in Chart A- Progression of Ageing.

Chart A-Progression of Ageing



Source : Researchers' Self Development Chart

Stages A-D indicates medical assistance, healthcare and public facilities and all these involves financial implications and the majority of the elderly in Malaysia needs such support upon reaching age 60 and above. Empty nest elders have considerable needs for daily living, health care, social support and public facilities support. The growing need for care of an aging population requires to be met through adequate policy decision making by the government.

Conclusion

A sound old age pension or employee provident fund (EPF) system is needed to guarantee sufficient financial support for the elderly. Looking into the future, positive steps towards an improved pension or employee provident fund contribution system are as follows:

(1) Expand the coverage of the pension/EPF system to bring more percentage of worker and employees into the social security system.

(2) Gradually increase the payment standards of the pension/EPF so that the participants of the system can get more benefits. It can make the system more attractive to those potential participants.

(3) Improve the management of the fund, especially increase the net value of the assets by investing them in a prudent manner.

Abstract

We have demonstrated that the model for Romania's regionalization has to consider multiple criteria. The purpose of this paper is to study one of them, the educational system. With the help of informational energy, we show that Romanian regions are very homogeneous regarding the number of students and teachers and their areas of residence, and they are also homogeneous when considering the number of schools in rural and urban areas from each county. This leads to the conclusion that we cannot use these criteria in order to decide on the structure for regionalization and that other variables also need to be analyzed.

Key words: development, education, regionalization, informational statistics, informational energy.

JEL Classification codes: C49, I21, I25, R13

1. Introduction

Regionalization with the purpose of stimulating economic development and cooperation with other regions in the European Union has been a common discussion in the last few years in Romania. Our so called "development regions" have only statistical purposes, they lack the status of administrative units and institutions able to stimulate progress. Before creating these institutions it is necessary to find the optimal structure for each Romanian region.

In previous studies (Lie, I. R, Mihăiţă, N. V., 2014, pp. 1-6), we have reached the conclusion that regionalization needs to be decided using multiple criteria, in order for them to be efficient and to last. Consequently, this study on the educational system is part of a more extensive research, taking into account different social and economic aspects important for Romanis's development. Until now, we have found that regions are homogeneous regarding population (Lie, I. R., 2015, (a), pp. 22-28), while variables from industry and services can be used in order to decide on the optimal formula for the terriotiral organization (Lie, I. R, 2015, (b), pp. 11-18).

In this paper we focus on variables from the educational area: the number of pupils and students, on levels of educations and areas of residence, the number of teachers, also considering the level of education and the areas where they teach, and the number of schools in rural and urban areas. We find that regions are homogeneous from these points of view, which means that other varibles should also be considered in order to make a decision on regionalization.

The first section of the paper presents the importance of education in development, as it is shown in literature, and the main characteristics of the Romanian educational system. Next, we discuss the methods used in the analysis and the results we obtained. We conclude with the main findings of the study and directions for further research.

2. General Characteristics of the Romanian Educational System

One of the main reasons that generated the process of regionalization is the necessity to stimulate Romania's development. We have chosen, as part of an extended study, to include the analysis of the educational system because we consider it is essential for development: "the economic development of a country depends on the level of education of its citizens" (Biriescu, S., Băbăiţă, C., 2014, pp. 77-86). The significant role of education is also underlined by UESCO (2007), in a document cited by Sedlacek: "education has the potential to play a major role in the future realizations of a vision of sustainability that links economic well-being with respect for cultural diversity, the Earth and its resources" (Sedlacek, S, 2013, pp. 74-84).

Also, related to the subject we study, regionalization, there are authors who emphasize the fact that education at all levels has great impact on the areas surrounding the educational institutions, but their role is often underestimated (Sedlacek, S., 2013, pp. 74-84).

The educational system in Romania has suffered different changes in the last years, in order to improve its performance, but reforms haven't proved useful. The system is currently characterized by a decrease in the weight of those who pass national exams (especially the baccalaureate at the end of high school), and also, by a decrease in the scores they receive. Also, there are concerns regarding the low scores that Romanian students obtain in the PISA tests.

Another important characteristic of the educational system is the presence of important differences between the education in rural and urban areas: in rural areas the enrollment rate is lower than in cities, the average duration of school attendance is also lower in the countryside, and school dropout is less frequent in urban areas (Apostu, O. et al, 2014, pp. 1-66). These problems come from the economic situation of the families (the lack of financial support especially for students coming from rural areas makes them dropout of school and get a job in order to help their parents), from the poor quality of education in the countryside (which makes children to migrate to urban schools) and from the lack of well-prepared teachers, who don't find it motivating to teach in those areas.

A positive evolution has been noticed in the professional education, with an increasing number of students who choose this path (Apostu, O. et al, 2014, pp. 1-66). A positive effect of this is the decrease in the dropout rate from high schools.

Also, as a consequence of lower graduation rates in the baccalaureate, the number of students who choose post-secondary education and foreman education has increased (Apostu, O. et al, 2014, pp. 1-66), which we consider to be a good thing, as not all high school graduates can cope with tertiary education.

It is obvious that some progress has been made, especially in what professional education is concerned, but there are still many reforms to be done and we consider that these reforms would have better results if they were designed for each region, considering the characteristics of each area. This will be easier to implement when regions will have administrative status, this is why we included the education system in our research on how to regionalize Romania in the optimal way.

3. Methodology

For this study we have chosen three variables that we consider important when analyzing the complex educational system: the number of pupils and students in each Romanian county, the number of teachers and the number of schools in these counties. We have calculated the informational energies for the regions of Romania, in order to determine their level of homogeneity regarding the three variables considered. As we have previously mentioned, the main purpose of our extended research is

to obtain the optimal formula for Romania's regionalization, so we have compared the homogeneity of the regions calculated for the current structure and for the proposed structures, the goal being to find the most homogeneous version.

We have used the latest data provided by the Romanian National Institute of Statistics, corresponding to the year 2014.

4. Data Analysis

First, we have analyzed the homogeneity of Romanian regions considering the number of pupils and students in each county, considering both the different levels of education (primary education, high school, professional education, post-secondary education and foreman, tertiary education), and the area of residence (rural and urban areas).

As Table 1 shows, in most of the cases the information gained is less than 5%, which means that from this point of view, Romanian regions are very homogeneous. However, except for Center region, the information for the proposed structures is lower than for the current version, which means that reorganizing the regions the way we propose would lead to more homogeneous regions. It is also worth mentioning that we have less homogeneity when analyzing the number of pupils and students by area of residence, which means that there are more differences between counties regarding the number of pupils educated in urban and rural areas. Some of the causes for this situation are the fact that in the country school dropout rate is bigger than in cities, and also the fact that some families from rural areas send their children to study in cities, hoping they will receive better education there.

Southwest	Current: DJ, GJ, MH, OT, VL	1,400	0,096

Source: Excel calculations based on data from Romanian National Institute of Statistics, corresponding to the year 2014.

It can also be seen that the region we proposed to create in the Southeast of Romania, made of two counties from Southeast Region (Constanţa and Tulcea), and two from South Muntenia (Ialomiţa and Călăraşi), is very homogeneous. The two regions we consider should remain unchanged, North East and Southwest, are also homegeneous, which supports our opinion.

Next, we have analyzed the homogeneity of the regions, considering the number of teachers in each county. In this case we have also considered the levels of education (school education and university education), and the area in which they teach (rural versus urban areas, only for primary and secondary education).

Table 2: Informational energies - Results for teachers

Region	**Structure**	**Information gained - levels of education (%)**	**Information gained - areas of residence (%)**

	Version: AG, DB, GR, PH,TR	0,320	2,890
New region in the Southeast	CL, CT, IL, TL	1,796	3,604
North East	Current: BC, BT, IS, NT, SV, VS	5,535	0,338
Southwest	Current: DJ, GJ, MH, OT, VL	2,454	0,299

Source: Excel calculations based on data from Romanian National Institute of Statistics, corresponding to the year 2014.

As it can be seen in Table 2, Romanian regions are also homogeneous when considering the number of teachers, both in the current structure, and in the proposed one. As in the case of pupils and students, the level of homogeneity grows in the proposed versions, except for the Center version. This result is not surprising, as the Romanian educational system has a number of teachers proportional to the number of students. As noticed for the other variable, the level of homogeneity is lower when analyzing the number of teachers according to the area where they teach. This is because in most of the cases, rural areas are less accessible; combined with the fact that wages are small, and working conditions are poor, teaching in the countryside is not motivating for teachers.

It is interesting to see that the regions in the South and East are more homogeneous, than those in North, Center, and West (area more developed than the others), which means that some counties from North, Center, and West are less developed than their neighboring ones, while in the rest of Romania counties have a more similar level of development.

The last variable studied was the number of schools, considering their location: rural or urban areas. The results of the calculations are shown in Table 3.

Table 3: Informational energies - Results for schools

Region	Structure	Information gained - areas of location (%)
Northwest	Current: BH, BN, CJ, MM, SJ, SM	3,705
	Version: BH, MM, SJ, SM	3,121
West	Current: AR, CS, HD, TM	1,313
	Version: AR, CS, TM	1,446
Center	Current: AB, BV, CV,HR, MS, SB	2,064
	Version 1: AB, BV, CV,HR, MS, SB, CJ, BN	2,696
	Version 2: AB, BV, CV,HR, MS, SB, HD	1,819
	Version 3: AB, BV, CV,HR, MS, SB, CJ, BN, HD	2,457
Southeast	Current: BR, BZ, CT, GL, TL, VN	4,930
	Version: BR, BZ, GL, VN	3,113
South Muntenia	Current: AG, CL, DB, GR, IL, PH,TR	1,625
	Version: AG, DB, GR, PH,TR	1,926
New region in the Southeast	CL, CT, IL, TL	6,662
North East	Current: BC, BT, IS, NT, SV, VS	0,510
Southwest	Current: DJ, GJ, MH, OT, VL	0,693

Source: Excel calculations based on data from Romanian National Institute of Statistics, corresponding to the year 2014.

As Table 3 shows, the situation for this variable is not as simple as for the other two, even if the information gained is less than 5%, sign of a high level of homogeneity. Most of the regions show more homogeneity in the proposed version, but West and South Muntenia are more homogeneous when keeping their current structure. The most homogeneous regions are those for which we didn't propose any change, North East and Southwest.

The high level of homogeneity of the educational system makes it impossible to use it in order to decide on the structure of the new Romanian regions, but the analysis can be developed further and used in order to propose suitable educational policies in each region, after they obtain their status of administrative-territorial units.

5. Conclusions

To sum up, in an attempt to find the optimal structure for Romania's regions (rank NUTS 2), we have studied variables regarding the educational system, as we consider this domain to be extremely important for development.

Using informational statistics, we have tested the homogeneity of Romania's current development regions, and also that of the proposed regions, regarding the number of pupils and students, the number of teachers and the number of schools. We have studied these variables considering the different levels of education, and also the area of residence, comparing the situation for rural and urban areas.

We reached the conclusion that in both current and proposed structures, Romanian regions are very homogeneous from the education point of view, which means that these variables cannot be used when deciding on the optimal formula for regionalization. The results can be used after the decision is made, in order to promote the best educational policies for each area. The extended research will continue, considering other variables, from other domains, that would help decide on the regionalization formula.

Abstract

Heritage is property that is transmissible by hereditary; it is treasury that has been owned before by some community, group, society, or humanity, and it has now become a priority in preserving and conserving the heritage. To consolidate and nurture appreciation that is intact to culture and heritage within a society, various efforts have been taken to protect, by collecting and documenting cultural heritage whether with tangible or intangible cultural value. Overall, the aims of this study are to propose a conceptual framework formation on the implementation of documentation strategy for Mak Yong's Performing Art collection in the cultural heritage institutions. Therefore, a pure qualitative methodological approach was used by a case study design, conducting semi-structured interviews and document analysis to examine the aperture on the implementation of documenting intangible cultural heritage collection in national archives, museums, and libraries.

Keywords: Documentation Strategy, Intangible Cultural Heritage, Traditional-performing art, Mak Yong

Introduction

Heritage is like an archaic diary that represents the life journey and civilization of a certain community through inherited knowledge and expertise of lifestyle, beliefs reincarnated through cultural objects, tradition, beliefs, and others. Heritage is divided into two main categories: tangible and intangible heritage, which respectively has a significant interest to the nation, community, organization, and individual. Tangible cultural heritage can be defined as something permanently seen, static, and portable (Jabatan Warisan Negara 2007; Lowenthal 2005; McLean 2006; Wilson 2009). Meanwhile, intangible cultural heritage is something explicit such as knowledge, expertise interpreted through oral tradition, customs, values and culture, language, and literature (Boylan 2006; Ekwelem et al. 2011; Howell 2013; Rees 2012; UNESCO 2013; Yazid Saleh 2010). The Malaysia National Heritage Act 2005 (Act 645) broadly identify an intangible cultural heritage as including any form of expressions, languages, lingual utterances, sayings, musically produced tunes, notes, audible lyrics, songs, folk songs, oral traditions, poetry, music, and dances produced by the performing arts, theatrical plays, audible compositions of sounds and music, and martial arts, that may have existed or exists in relation to the heritage of Malaysia or any part of Malaysia or in relation to the heritage of a Malaysian community.

UNESCO's effort through the Convention for the Safeguarding of Intangible Cultural Heritage 2003 concerning the ICH has seen an upsurge due to awareness of the disappearance of traditions as a result of failure in local cultural reproduction, preservation, and maintenance in the globalization epoch. This has prompted Malaysia to get a proclamation of intangible heritage. On 25 November 2005, UNESCO declared Mak Yong's Performing Art as the "Third Proclamation of Masterpiece of the Oral and Intangible Heritage of Humanity" in the world. This is an enormous recognition and a huge responsibility to the nation to conserve and preserve it as a world heritage and to make it accessible and profitable to the country.

Overview of Mak Yong's Performing Art

Mak Yong is an ancient dance-theater form integrating the elements of ritual, stylized acting and dance, vocal and instrumental music, song, story and formal as well as improvised spoken text (Yousof 1979). It is predominantly found in the villages of Kelantan in the northwest of Malaysia and performed mainly for entertainment or ritual purposes related to healing practices. However, the region's governmental authorities are adjudicative and prohibit this cultural capital of Malaysia because it contradicts with the Islamic ideology, which bars the sexual involvement in the performances. Due to this strict prohibition, this cultural heritage is being eroded by the premier mainstream, modern social focuses, and the lack of community engagement. Moreover, Ab. Aziz Shuaib & Raja Iskandar Raja Halid (2011) conceive that this action debilitates the Malay ICH particularly the performing arts given the rising tide of Islamization in Malaysia.

National support of ICH

National support in the safeguarding of ICH can be seen through the setting up of a national agenda. Two decades of Malaysia Plan from the 7th Malaysia Plan (1996-2000) to the 11th Malaysia Plan (2016-2020) comprise of respectable planning, strategies, and outcome in integrating the cultural heritage sources. Below is a table that summarizes the main cultural agenda of each Malaysian Plan.

Table 1: Malaysia National Plan (RMK) main agenda

Malaysia National Plan	Main Agenda
RMK-7	Development of a cultural infrastructure
RMK-8	Appreciation and promotion of cultural heritage as a tourism attraction
RMK-9	Preservation and conservation of cultural heritage products
RMK-10	Art and cultural transformation
RMK-11	Research and expansion of the cultural heritage

The Ninth Malaysia Plan's (2006-2010) documents encompass the strategies, programs, and the required allocation of RM 442.2 million budget. A total of 63 percent was allocated to the relevant organizations that deal with heritage to realize heritage protection, preservation, and conservation programs in cultural heritage (Nurulhuda Adabiah Mustafa & Nuraisyah Chua Abdullah 2013). The national archive and national museum received a total of RM113 million and RM100 million respectively in support of distribution of information and knowledge among the public as well as to promote research and generate a source of economic growth (Unit Perancang Ekonomi 2005).

Roles of the Cultural Heritage Institutions in Safeguarding ICH

Globally, archives, museums, and libraries are recognized as cultural heritage institutions that are responsible for managing, storing, classifying, distributing, and preserving the rich resources for access to the public and for transmission from one generation to the next. These institutions have their own methods of collection and management; archives act as national research centers that collect and maintain records and vital documents containing particular evidence and history; museums act as the national exhibition center in collecting and demonstrating objects and artifacts; and libraries act as an information resource center in collecting various sources of reference.

However, when reviewed from the perspective of documentation science, it can be said that the relationship among archives, museums, and libraries are "related". They are related because each one deals with documentation concerning the activities of acquisition, classification, description, storage, preservation, and reference services towards enriching the cultural heritage (Sulistyorini 2015). The collaboration of the

documentation activities among these institutions will instigate responsiveness in sustaining the cultural heritage and enriching the ICH collection. Cox (2003) describes this as a multi-institutional collaboration in establishing institutional archival programs rather than being especially dependent on collecting historical manuscripts, setting explicit goals for developing documentation, and merely achieving adequate documentation by analyzing existing records that are often fragmented. In addition, Perera and Chandra (2014) expressed that archives, museums, and libraries can collaborate not only in documenting ICH collection to ensure accessibility and sustainability for future generations but also in assisting countries to generate income for economic stabilization.

Literature review

Documentation strategy model

In archival science, Helen Samuels, Larry Hackman, and Patricia Aronsson initially presented the documentation strategy concept at a session of the 1984 Society of American Archivists' annual meeting. In spearheading the work in the archival literature, Helen Samuels (1986) proposed the characteristics for documentation strategy that would require (1) a particular scope of documentation; (2) the involvement of archivist, records creator, users, and administrators; (3) multi-institutional participation; (4) encouragement in the creation of records, rather than only dealing with existing documentation; and (5) continuous processing and improvement for transformation to take place. Years later, other proponents such as Hackman and Warnow-Blewett (1987) emanated a model for the development and implementation of documentation strategies by viewing the case study of the documentation program at the Center for History of Physics in the American Institute of Physics (AIP). Experience from the project offered further reassurance that a documentation strategy could be successfully implemented.

This model remained until Richard Cox reviewed it as a "largely untested" concept (Cox 1989) against the Western New York Documentation which poses a number of additional issues about the documentation strategy that still needs resolving such as geographical issues, funding resources, long-term strategy, and the issue of what distinct options of the documentation strategy model may yield better results in enhancing the documentation of a society. Based on the outcome of this project, Cox suggested that the documentation strategy had four basic elements: (1) an analytical tool; (2) an interdisciplinary process; (3) recognition of inherent documentary problems; and (4) the formulation of a plan. The stance of both scholars has an apparent trifling gap because it is still focused on the development of collection in the archival institutions, refined acquisition policies and formulation of plans to assure adequate documentation, which necessarily involves the step of identifying and filling the gaps in existing documentation strategies.

Community engagement and trust

The Convention strongly recommends community participation in all safeguarding activities (Article 15) where ICH depends on continuous community involvement for its presence, and community participation is an imperative tool in documenting ICH. This involves thorough awareness and continued engagement and trust with local communities, involving practitioners, community, organization or local people of a province in ICH mapping. Chaudhuri (2012) proposed that the community and practitioner lead the documentation process with the information; however, this might raise issues prompting further research. On the other hand, Deacon (2012) argued that the most successful community-research partnerships have a community-driven motivation for involvement, community representation at an early stage of the project design, strong community involvement in implementation, and dedicated community liaisons. Although the Convention encourages and even requires community engagement in safeguarding ICH and a number of existing guidelines that could be used to address some specifications on documenting ICH as a tool for safeguarding, new ICH documentation guidelines or framework would need to be designed together with appropriate existing guidelines and additional guidance for use by community members, documentation experts, researcher, NGOs, etc.

Cooperative Collection Development Policy

The key elements in implementing an integrated documentation of ICH among cultural heritage institutions are considering and applying cooperative collection development policy for the institutional collection. According to the necessary steps in a thoughtful and systematic acquisition program by Booms (1987), it involves an extensive social theme with a perspective to preserve records representing the topics in a variety of repositories (including private archives, public archives, libraries, museums, and other appropriate institutions).

However, to develop a successful documentation project, a practical and flexible written collection development policy with standards as well as a constructed strategic plan for continuing collections that emphasize on particular communities or events are required (Thomas 2010). A more practical policy can be used to guide archivists, museum curators, and librarians to make decisions on collections that need to be accepted, rejected, or ignored in order to fulfill the gap of institutional collections.

Professional System

Systematic human asset administration is the root to effective protection for ICH collections in cultural heritage institutions. Professional competency and consultancy in the documentation and preservation process need to be enhanced based on knowledge and academic qualifications specific to this field. Navaneethakrishnan (2013) agreed that librarians could act as historians, anthropologists, commenters, philosophers, artists, and improve themselves as policy makers in design research and practice to strengthen their obligation and role of safeguarding the ICH collection. Training is similarly significant to the professional system in ICH documentation where it requires specialized training and unique dependence on the nature of ICH (Phiri 2014).

Collection Management Procedure

Cultural heritage institutions respectively configure their prominent roles in sustaining ICH in this country through the process of acquisition, classification, description, storage, preservation, reference services, and advocacy towards offering an enriched cultural heritage to the public. Without these attributes, there would be no means for sustainable documentation of ICH for the future generation (Templanza & Templanza 2015; Habeenzu 2014; Pijeaux 2007; Manžuch 2009). It seems the sustenance of the national agenda is in creating public awareness and appreciation of the valuable treasure in order to make information and indigenous knowledge accessible, retrievable and comprehensible at the right time, to the right people, in the right format.

Figure 1: Research Conceptual Framework for documenting ICH collection

Conclusion

Documentation of Intangible Cultural Heritage (ICH) requires a distinctive methodology contrasted with execution towards heritage sites, monuments, buildings, and nature. ICH, much like language, workmanship, music, and dance, is more complex and requires particular information, knowledge and ability towards preserving it. The treasured and sensitive value needs to be reared through cultural heritage expertise that covers prospective dancers, musicians, minstrels, writers, historians, and the local community, and it requires guidelines in documenting their collection systematically.

Resilience of the European Nations against Antropological Risks: A Need of Development of Holistic Framework

Bohuslav Pernica, Faculty of Economics and Administration, University of Pardubice, Czech Republic, bohuslav.pernica@upce.cz
Hana Tomášková, Faculty of Informatics and Management, University of Hradec Kralove, Czech Republic, hana.tomaskova@uhk.cz

Abstract

Since 2006, the EU has provided a framework for national policy in area of resilience against anthropologic risk which is known as the European Programme for Critical Infrastructure Protection. However, this program is rather summative than holistic. From that reason, some EU member countries have developed national resilience concept. The paper deals with the issue of further scientific development such concepts in nexus with changing of social paradigm known as population aging and vagueness of concepts of resilience focusing on values of social environment. They considered as a decisive factor for national resilience but they are to operationalize with difficulties.

Keywords: Resilience, Anthropological Risks, EU.

Introduction

After the 9/11-terrorist attack on the World Trade Centre in New York, the United States, the European Union as a vital partner of the United States and essential part west Christian civilization as well faced up to a surge of extremism and terrorism menace. In response to such a challenge, the European Programme for Critical Infrastructure Protection (EPCIP) was adopted in 2006 (EU 2006). In fact, this document was issued in order to provide an initial framework and guidance to the EU countries in area of economic and social resilience of nations against illicit activities undercutting the European Union´s effort to ensure social cohesion. So far, such activities have been carrying out by non-state actor such separatists and terrorist organizations; however, since staring the Ukraine crises, the vital interests of European citizens have been endangered by activities generated by some state actors. Some security and defence experts, e.g. Kofman & Rojansky (2015), Popescu (2015) Major & Mölling (2015), Aaltola (2014), have considered such activities as hybrid warfare endangering vital interests of some European Union member countries.

Taking into account the aim of EPCIP is to "*improve the protection of critical infrastructures in the EU*" (EU 2006) as well as the fact that National Critical Infrastructure ought to be designated by severity criteria such political and psychological effects, any concept of European nation´s resilience against anthropological risk should be more complex and holistic. Furthermore, such a concept should be tailored by each EU nation itself. Thus, the aim of this paper is to provide some points for orientation of research focusing on the development of a national resilience concept.

Concept of national resilience in brief

On the one hand, the resilience topic emerged as an agenda in strategic governance of European countries 15 ago, on the other one, the concept of national resilience appeared already in the 20th century. From sociological point of view, the resilience of a society or a national economy is derived from biology. In particular, that is an analogy Windle (2011) with living organisms and the term reflects individual's ability to properly adapt to stress and adversity. From such a point, both primitive organism such viruses, germs, insect, etc., and complex ones such mammals are able to overcame shocks, stress, injuries, illnesses, and other factors endangering their ability to exist and develop in their life-cycles. That can be applied on small groups of individuals, for instance, on families, even,

on complex groups of organized individuals which often form themselves into institution such production plants, cities, armed forces, public administration, states, civilizations and so on.

In case of social groups, the purpose of having resilience is to recover from any attack/shock/stress as soon as possible and be prepared for another such harmful event with a devastating impact. Going more into details, such an event was a war. On that account, the concept of national resilience was developed after 1918 because the WWI has predetermined the pattern of the next war. In comparison with armed conflict in the past, the course of WWI has proved that the military effort in the front line requested more resources than any other ever and warfare lasted for such long time than any conflict in 19th century. (Broadberry & Harrison 2009, Harrison 2000) After all, any future war must be getting total one because even larger part of society and national economy ought to be mobilised and militarized in order to increase the only tiny prospect for fighting it out as a winner. From such a point of view, the winner in a long war should be the nation which resilience would be higher than its opponent.

Regarding that fact, the concept of resilience was re-developed in communist countries during the Cold War. Communist experts in war economics, e.g. Cavar (1980), emphasized the resilience of national economics for expelling a NATO´s military attack with full success. Therefore, the resilience was a topic fully integrated into central planning. Nonetheless, such complex approach has been abandoned in all former Warsaw Pact countries which a lot of them are EU members now. Some differences between the EU and communist approach are presented in tab. 1.

Table 1: European resilience concepts for military and non-military/civilian purpose

	European Union	**Cold War (Communist Countries)**
main support for	global competitiveness	total war
main purpose	continuity of economic activities and ensuring of human rights	continuity of economic activities
protection against	terrorism, cyber-attacks	nuclear attack, military warfare and sabotage activities
main focus on	infrastructure protection, vitality of economy and government	abundant stockpiles, industry protection, population protection, indoctrination
system features of concept	non-ideological, summative	ideological, holistic
justification of concept (doctrine)	human security concept	Marxism–Leninism (military protection against imperialism)
main stakeholder	ministry of the interior, economic ministries	ministry of defence/the military
framework	contingency planning/emergency planning (co-ordinated strategic planning)	defence planning (an extra part in central planning: comprehensive Five-Year-Plans)

In comparison with the communist concept of national resilience, the essential deviation of EU national resilience of a democratic country from the resilience of state carrying on people's democracy consists in the quality of national resilience concept. In particular, the communist concept is holistic whereas the European one is rather summative despite the fact that EPCIP requests a comprehensive risk management. (EU 2006) Going more into details, it is caused by different approach to polity matters. In comparison with subsidiarity and complementarity principles of EU public policy, we should bear in the mind that the block of communist countries was formed by

principles of blind ideological unity. Hence, the processes, institutions, organizational structures, strategies, public policies, etc. were copied from Soviet Union to its satellite people democracies in accordance with ideological doctrine of Marxism-Leninism known as dictatorship of the proletariat and international reciprocity communist countries. On the contrary, such an undemocratic approach is in the EU inadmissible.

A need for the development of national resilience concept

Nonetheless, a difference in principles of convergence applied by EU would not be a barrier in re-thinking of the national resilience concept. Further development of EPCIP would be beneficial be in nexus of the Ukraine crisis. From that point of view, some EU countries bordering with non-EU countries using hybrid warfare have developed their national concept. In order to raise the level of national resilience against hybrid threats, they re-introduce some measurements abolished after the end of Cold War. However, any concept is usually indefinite, in particular, if it is focusing on values of social environment, such solidarity, cohesion, sustention of human rights, and so on. Unfortunately, such values contribute to national resilience significantly according to evidence given by some experts, e.g. de Weijer (2013), Kihmi (2015) Renschler et al (2010).

Many theoretical concepts of national resilience published recently, e.g. Gal (2014), Chasdi (2014), and Canetti et al (2014), underlined significance values of social environment for national resilience, on the one hand; on the other one, those concepts are difficult applicable for justifying on allocation of public money. Neither fear nor support of values of social environment should be a main reason for raise of public spending in any state in the world. The question “how much is enough?” should be answered ex ante and programs focusing on improving the level of national resilience ought to be scrutinised by economy efficiency, effectiveness criteria.

In addition, that kind of analysis is essential due to changing of paradigm. While the governments in the 20th century could on demographic development the population aging is going to change that paradigm. Most of European societies are changing bit by bit; postures and opinions in polls will have been determined more and more in the next 10 years by elderly population, largely by women. Moreover, the structure of ethnicity would change as well. Taking into account such prospects, the development of national resilience concept should be based rather on modelling and simulation than on experience from the past. Ergo, more scientific approach is desirable in the strategic governance. The war against terrorism lasting already for decades would be fought out only by states which resilience would be higher than its opponents. Ironically, a most of EU governments does not know which level of resistance has their nation although EPCIP is implementation in almost a decade.

Conclusions

The decade of terrorism, hybrid warfare and the recent influx of refugees into Europe have attracted attention of many European governments to defence and security matters. One of the re-introduced agenda in that field of governmental activity is the national resilience against anthropological risk. A European framework for developing a national concept of resilience is EPCIP. Unfortunately, EPCIP is rather orientated on technical aspects of resilience, in addition, on the resilience of national economy. However, resilience is complex phenomenon; hence, some nations developed national resilience concepts including specific values of national environment. In relation to changing social paradigm, it is rather vague if the allocation of public spending driven by such concept will be ever fruitful. In order to prevent from wasting public money, a more scientific and multi-discipline approach is needed for development of national concept of resilience. Primarily, mathematic modelling and simulation should be applied in that area of governance.

The impact of Knowledge Based Organizations on Managerial Reengineering

Abstract

Adapting to the requirements and demands of the global economy depends, to a large extent, on the development of a new type of organization, with a different management. The organization and management based on knowledge are the result of complex, burdensome efforts, in which the objectives, modalities of resources employed and organizational culture have new dimensions. One way to promote and develop knowledge management is by means of managerial reengineering, based on five components: objectives - processes - structures - people (managers and performers) - results. Considered a development of the already popular BPR (Business Process Reengineering), managerial reengineering aims the whole management of the company, from organizational component to human resources management, decision-making, informational and methodological components. The new type of organization creates unprecedented opportunities in order to improve the management role in achieving performance, through knowledge reconsidering and intellectual capital. Managerial Reengineering conducted under these new conditions requires a new type of management exercised by T-managers with the active and responsible participation of knowledge based employees. Our work shows direct links between reengineering, on one hand, and the organization and management based on knowledge, on the other hand, by showing the connection type cause - effect.

Keywords: business process reengineering, knowledge management, knowledge organization.

Introduction

The generally recognized framework which brought to record knowledge management is relatively recent, although there are many issues and concepts related to the roots of management on which specialists of those times drew attention and which are now, decades after, considered to be a foundation of knowledge management. Among the most relevant examples of this are the Hawthorne experiments (1924-1932), where the importance of informal groups is recognized for the first time, as the basic unit of the communities of practice in today's knowledge management. Also, Theory Y by Douglas McGregor, although developed in 1950, can be seen as a turning point, a signal alert for the approaching era of knowledge management,when managers should incline to support employees, guide and encourage them and act like leaders (Wren, 2005).

Another issues is related to the emerging concepts and studies related to intellectual capital (as an asset which includes knowledge) constituted a turning point. It has been demonstrated that the processes of knowledge creation in organizations have a direct impact in terms of human capital accumulation and growth, and this performance growth in human resources entail an evolution in the structural and relational capital of the organization (Gholamhossein 2014). Moreover, in the public sector, researchers (Akdere, 2009) are already looking into the way the intellectual capital exists in the organizations, considering that the phase of generating normative solutions has already been exceeded. Of course, being a highly complex subject, intellectual capital, just like knowledge management, still demand effort from specialists in many respects, because the solutions given so far on measurements still involves many empirical evidence and too little quantitative ones (Ramirez & Grodillo, 2013).

At macroeconomic level, formally, the European Union recognizes the importance of knowledge in the Summit in the year 2000 through the Lisbon Strategy, whose overall objective is to make Europe the "knowledge economy the most competitive and dynamic in the world, characterized by sustainable economic growth, employment more and better quality and greater social cohesion" (Presidency conclusions, Lisbon European Council, 23 and 24 March 2000). Whilst this strategy has contributed significantly to the creation of knowledge-based economy in the EU, the accomplishments were far from the initial set of expectations, which led to the entrance on stange, in June 2010, of the Europe 2020 strategy, as an extension of the previous strategy. The Europe 2020 Strategy projects the EU development for 2011-2020, focusing on further developing the knowledge-based economies, in which the proliferation of knowledge-based organizations is a core element. This strategy is implemented in Member States through the National Reform Programmes (NRPs).

Literature Review

Related works on Knowledge Management

Specialists from around the world from various institutes and prestigious universities have seen the mutations in the economy, in organizations and in their management, due to the persistance of knowledge as a factor and prerequisite for obtaining sustainable performance and as evidence we have the strengthening of knowledge management as a scientific discipline since the year 1995 (Nicolescu&Nicolescu, 2011).

Because of the special concern shown to this area, the European Union takes another step forward in March 2004 through the European Committee for Standardisation. Following a workshop, the ECS (European Committee for Standardisation) issues a resolution (CEN Workshops Agreemennts - CWA 14924) - European Guide to good practice in the Knowledge Management - consisting of five parts related to: (i) a general framework for knowledge management, (ii) organizational culture in knowledge based organizations, (iii) a methodology in order to help implement knowledge management in SMEs, (iv) guidelines to measure the progress of companies in this field and last, but not least, (v) a brief overview of the concepts used in the guide. In part four (iv), dedicated to measuring the progress of knowledge management, there are mentions of evaluating the implementation efficiency of knowledge management a series of performance indicators of KM are proposed.

At the microeconomic level, it has been accertained that the practice of knowledge management is one step ahead of the scientific evolutions. Many experts (Brown & Zhang, 1999; Akdere, 2009; Nicolescu, 2011; Spekman & Davis, 2016) recognize the emergence of the knowledge organization (also called the knowledge based organizations) described in various general forms (learning organization, sustainableorganization), but also specific forms (clusters, virtual organizations, emerging companies etc).An interesting aspect to note here refers to the sequence of these two processes. Do we have the knowledge-based organization first, and inside its' shaping an adapted management, ie knowledge management? Or the practice of management, with new principles and new instruments, leads to organizational transformation and towards knowledge-based organizations? The authors tend towards the second option, because the type of management practiced in an organization is the primary determinant of the organization's functionality and performance. Adopting knowledge management instruments, step by step, then knowledge management models, and finally implementing knowledge-based strategies, companies are becoming knowledge-based organizations. Of course, the context or environment is also important, given that different studies (Liebowitz, 2011) show that certain industries are more open to implementing such knowledge based models and there are even recognised emerging industries from this point of view (energy, aerospace, pharmaceutical etc.), while other areas shows enormous potential in terms of knowledge-based processes, but the interest of managers can not be found easily, and so these specific industries have not yet taken enough steps to implement knowledge management models (health, for example).

As a definition, a consensus has not been yet reached regarding the meaning or content of knowledge management. There are more than 100 published definitions of this concept (Dalkir, 2011), and some

authors (O'Dell) came up to making clasificationsof defining schemes due to the increased number and multiple approaches in this regard. Some first definitionsof knowledge management arose from the business perspective: "knowledge management is an integrated and collaborative approach in order to create, capture, organize, access and make use of the intellectual property of a company" (Grey, 1996).

Later, the notion of intellectual capital became the center of finding meanings: "knowledge management refers to ways to leverage intellectual capital so as to improve organizational performance" (Stankosky, 2008). Of note is the definition of cognitive school (Wiig, 1993, 2002), which points to the role of knowledge as the main factor leading to the implementation of organizational life (also personal and social) in an intelligent manner, increasing the effectiveness and efficiency of the business processes conducted. There are many approaches that make a confusion among knowledge management and the so calles information or document management, and also technology-based on management. These approaches are certainly restrictive and limitative because they do not capture the important role of knowledge, norethe knowledge related processes.However, the consensus that has so far been reached in the literature refers to the multidisciplinary nature of knowledge management, which includes areas such as: technology on databases, cognitive science, artificial intelligence systems, decision support systems, web technologies, collaborative technologies, education and training, sociology and communication studies. (Dalkir 2011, p. 8).

The main theoretical approach on this subject in Romania delineates between knowledge management in practice, on the one hand, and scientific aspects, on the other. As a science, knowledge management consists in studying the "processes and relationships of knowledge management, in discovering legalities that govern this domains and develop new sistems, methods and management techniques in order to increase economic, social and ecological performance of the organizations, valences capitalizing knowledge"(Nicolescu&Nicolescu, 2011).

Although still under debate on the usefulness and the concrete results it generates, knowledge management has gone through various stages, which show the high degree of conceptualization of the changes that were recorded in the scientific and pragmatic fields. Some approaches (Dalkir, 2011) consider that the first phase of knowledge management was the period of 1900 (communications era), then the computers' period (1950, with the advent of the Internet in 1996), the virtual era (started in 1980) and the last phase, the current one, the personalization era (since 2000). Other approaches are more punctual and namethe first phase of knowledge management as the phase of information technologies, phase 2 - emphasis on human resources and aspects of organizational culture in the knowledge organization, Phase 3 - taxonomies and focus solely on content (Koenig, 2012). Another relevant approach concerning the development stages of knowledge management is explained through the tacit or explicit knowledge involved: thus, phase 1 would be the phase of explicit knowledge, whenthe importance of it is recognized and efforts are made to capture it for reuse; phase 2 would be the tacit knowledge phase, where the emphasis lays on communities of practice and their role, and Phase 3 is the phase of ideas, when we use the knowledge gained in phases 1 and 2 to generate new knowledge so as to solve complex problems and increase functionality and performance in organizations (Common Knowledge Associates, 2010).

Relates works on Business Process Reengineering

In literature, in the context of managerial reengineering approach, it is thought that we have two different knowledge management approaches. First, we have the structured approach (Nicolescu&Nicolescu, 2011), which states punctual changes in the management and organization based on knowledge (the appearance of knowledge function, training function, changes in the key management processes and the management system of the organization). Although this approach is comprehensive and also includes aspects related to procedural changes, the second approach to knowledge is preferable, the procedural approach (preferred by most foreign authors), which shows the organizational changes through the new and old processes in the organization, related to knowledge.

It is basically, the approach that puts in center the processes of knowledge, from their capturing, codification, sharing, application, protection and reuse. Whatever these processes are, whether they are part of the value chain (based on knowledge) of the company or not, they produce fundamental change in the management of the organization and should be treated separately, especially in the context of reengineering. Reengineering refers to business processes and the current activities that contribute to creating value for the customer and represents an important way of flexibility, economic and social modernization through fundamental and radical redesign of the organization.

In the last decade, there were numerous definitions of the BPR concept, both researchers and practitioners have introduced their own definitions of reengineering. No matter how it is defined, its main purpose is to restructure business processes (Yin, 2010). Similarly, Kontio (2007) provides an operational definition, stating that BPR is an approach in which business processes are redesigned to maximize the potential of the organization.Developing and applying the methodologies to analyze processes in an organization aim to understand how processes are inter-connected. The main processes leading to the achievement of objectives, increase efficiency and effectiveness of the organization, taking into account the customer needs.

At the center of the concept, there is the notion of discontinuous thinking - recognizing and challenging the traditional approach of management science (Calin, 2000); outdated rules of work design and basic, but invalid assumptions, about customer, IT technology, tacit and explicit knowledge, organizational culture.A BPR project requires a special effort from the company, especially at the allocated resources (human, technological, financial). The analysis and remodeling of the company's activities should focus first on the most important areas of its competence - objectives, processes, people, depending on the specific needs of the company. Subsequently, auxiliary processes will be addressed gradually and remodeled/outsourced to support core processes.

In today's turbulent and constantly changing environment, the processes must be agile to meet the challenges of customers, in an increasingly inter-connected global market. Characteristics of modern processes:

- Allows inter-departmental communication and improve the coordination function;
- Improve productivity, creativity and innovation;
- Greater transparency regarding the work done and the results obtained;
- Main processes, those that create value-added for clients, represent the support of knowledge management. (Hussein Hammoud, Bazzi, Haj-Ali, 2014)

BPR initiatives not only allow cost reductions, increased efficiency and added value for customer, but also represents a solid foundation for the implementation of many other existing tools and solutions for managing a modern company.

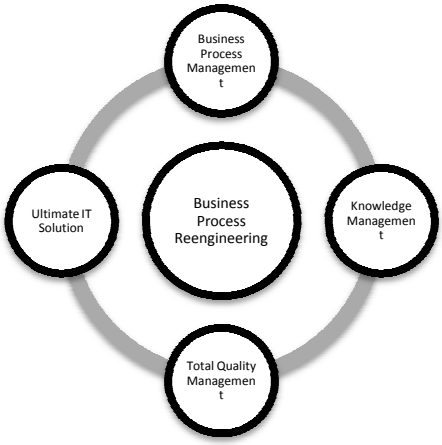

Fig. 1 - The fusion of BPR with other modern tools (made by authors)

A broader idea that we want to emphasize is that most reengineering projects create a favorable environment for knowledge management application. BPR can be considered the support triggering the shift to knowledge-based organization.

Research Methodology: the Optimized Model for Managerial Reprojection

Managerial reengineering means, according to Romanian experts (Nicolescu& Verboncu, 2008, p.15-34; Verboncu 2013, p.35-47), not just re-projection and redesigning of business processes, but also rethinking and redesigning of all management components (subsystems), using a methodological scenario divided into five sequences: objectives, processes, structures, people (managers and performers), results (performance). What will occur in the configuration and content of the management system, as a result of managerial reengineering, in the context of the transition in the organization and management based on knowledge?

Objectives

The first sequence of managerial re-projecting is represented by the objectives, where the expected changes in the context of transition to knowledge-based organization and management, are closely linked to the most important "product" of the foresight function, the company's strategy.Objectives are a crucial component of an organization's strategy, and, in production companies, where we have smart specialization strategy, based on eco-innovation, it is obvious that these objectives must aim, as a priority, increasing the stock of knowledge, with the implication of their T-managers; and their successful operationalization, by specialists (employees) based on knowledge.Like any strategy, the knowledge based strategy is developed by managers, approved by stakeholders and applied by T-managers, with the support of performers.The objectives of knowledge based strategy should be SMART (Specific, measurable, applicable, realistic and within a certain timeframe), contoured to stimulate creativity (individual's ability to produce new ideas, likely to be turned into practically, useful news) and innovations (new products, new technologies, new methods, etc.)

Objectives are the starting point in any complex process of organizational and/or managerial change, therefore, depending on their volume complexity and diversity, processes, structures, decisional, informational, methodological components and human resource management will be designed or redesigned. (Verboncu, Serban, 2015)

Processes

For achieving, objectives require, certain processes, mainly activities, redesigned through organizational, information and, above all, human perspective. Emphasis should be placed on the processes which generate value, on the treatment processes of knowledge (identifying knowledge, buying knowledge, assimilating - through learning - knowledge, creation of new knowledge, storing, sharing, use, protection and exploitation of knowledge (Nicolescu, Nicolescu, 2011 p.107-109).As a result of this enumeration process, combined by the authors of the source cited above in knowledge function, assimilating or learning of knowledge, involve a new procesual component, called the training function.Unfortunately, the specific processes of this last function are carried out sporadically, with low intensity, either because of the financial resources allocated to training and continuous professional development which continues to decrease, either due to a conservative attitude of managers, regarding the assimilation of new knowledge.We propose two types of training for managers and specialists of the Romanian companies:

- Option I - gradually training, following the model designed and operationalized by the Academy of Economic Studies in Bucharest, 13-14 years ago: stage I - improvement of senior managers; Stage II - improvement of middle managers; Stage III - training and managerial skills development (lower level managers); stage IV - training of specialists with managerial role in the performance of business processes and auxiliary positions in the company.

- Option II - training organized by the management of the cluster (where clusters were established as organizations which generate knowledge); trainers are university professors involved in the establishment and operation of the cluster and experts from research organizations and development (providers of know-how in technical and technological field) along with professors from universities/faculties and economic management for the transmission of economic and managerial knowledge;

The main problem is training content, i.e. the types of knowledge to be transmitted, assimilated, learned and subsequently applied by participating in professional and managerial training sessions: new production technologies, solutions for capitalizing upper waste (waste management), smart solutions for storage, advanced IT technology, managerial solution for new production technologies, solutions for capitalizing upper waste (waste management), smart solutions for storage, advanced IT technology, managerial solution for knowledge-based organizations (strategies based on knowledge, managerial reengineering, organizational culture based on continuous innovation, promoting new managerial tools, such as auditing and benchmarking knowledge, adapting management by objectives, management profit centers and development of clusters and virtual companies, etc.). Active learning, promotion of modern methods of e-learning, digital platforms courses, coaching and mentoring, are nothing more than organizational learning solutions for highly effective, relatively easy to use in the knowledge-based organizations (Nicolescu& Nicolescu, 2011). At the same time, training, along consulting services, management methodologies and improvement of recruitment, selection, classification, evaluation, motivation and managers are major ways of promoting professionalization of managers and management (Verboncu, Iorga, 2015).By procesual remodeling, the "narrow places" that block the full exploitation of production capacity are eliminated, acquiring a new dimension and new functionality, some critical activities in terms of informational or human capacity, are "re- stored" on the flow of production in order to obtain a new product.To function normally, any process, especially the core and support processes must have adequate structural and organizational support, i.e. to be the subject of a post or group of posts, delimited and properly sized.

Structures

The sequence "structures" of managerial reengineering methodology involves redesigning the whole or part of the structural organization.Repositioning of posts or compartments in the structural configuration of the organization, appearance and disappearance of posts or compartments, flattening the organizational structure, defining wider positions, avoid narrow specialization that inevitably lead to the manifestation "silo" effect, synchronization of the official authority with the personal authority, especially at management posts, promotion of "enrichment", "widening" and "rotation" of posts in terms of ensuring a high mobility of the structural organization, the outsourcing process and, especially, structural and organizational are as many ways to structural redesign and creating and promoting organizational structures capable to support the running of knowledge-generating processes.Switching to knowledge-based organization and management implies a lax definition of jobs and functions, increasing the share of authority relations of functional and cooperation type, in the detriment of control and hierarchical authority, managerial and economic decentralization within the company (we consider primarily midsize and large companies), appearance of specialized treatment knowledge positions and functions, focusing on achievement of pre-established roles more than the tasks executed, multiplication of projects and teamwork and strengthening the relationships with key stakeholders.These areas could become operational under conditions in which many of the companies in Romania (ex. woodworking industry) are active in different clusters, capable of managing large projects, such as environmental protection, waste recovery times or promotion of competitive new products and technologies. It is impossible to conduct such projects without financial support given by European funds and the sustainability of these efforts cannot be achieved only by involving clusters.

People

The fourth sequence of this methodological scenario is represented by people, meaning that those who provide management processes, business and auxiliary, managers and contractors with well

defined roles, bounded across the organization. The content of this stage involves substantial mutations of decisional, informational, methodological components and human resources management system; The starting point is the basic role of managers and performers, as follows (Verboncu, 2013):

a. Managers execute management processes, elaborate and adopt decisions which influents the decisional behavior and act of performers. To fulfill this very important role in the economy of organization management, they appeals to decision-making processes, divided into distinct stages and phases.Rigorous elaboration of decision requires, on the one hand, quality information, transmitted operative on supple information channels, treated with adequate informational procedures and proper technical means (mainly electronics) and, on the other hand, management tools as sophisticated (methods and management techniques), capable of facilitating solving of complex, multidimensional problem;
b. The performers apply those decisions through appropriate actions. To substantiate it, they need qualitative information and a good organizational climate, conducive to successful operational of decisions.

Performances

The last sequence of the managerial reengineering process is to identify and record the results in achieving the objectives. For this, we rely on a system of indicators and indices of variable nature, such as management, economic, financial, technical and technological, commercial etc, which are further debated in other types of researches.

Results and discussion

Therefore, as seen above, it is necessary a re-projection of the decisional, decision, informational, methodological subsystem and human resource management, which, in terms of transition at knowledge-based organization and management (and also as the most practical result of this study) involves the following changes.

Regarding the decision component

• In modern organizations, it is necessary the exploitation of an increased volume of knowledge in developing decision-making processes, which lead to adoption and implementation of strategic decisions;
• Strategic decisions become priority because of their pronunced innovative dimension (see also the decisions taken by the management of the cluster, which requires an active, effective and responsible involvement by the majority of stakeholders);
• given that creativity and innovativeness are notable features of the business processes of knowledge-based organizations, random and unique decisions tend to have a much higher proportion compared to traditional enterprise;
• substantiation and adoption of uncertain and risk decisions, involve resorting to methods and techniques with mathematical foundation, some of them found in specific IT tools (ELECTRE bi and three-dimensional method, decision tree, fuzzy sets method);
• Both managers (decision makers) and performers must be professionals, must possess complex and diverse knowledge, updated through continuous professional training;

Regarding the information system

- Consideration of a new paradigm of information system, embodied in focusing on identifying the needs of information and knowledge and ways of satisfying them, while addressing the use of information and knowledge in a strategic and economic vision, focused on efficiency (Nicolescu, Nicolescu, 2011);

- Reconsidering the educational and the documentation function of this system;
- The information system based on knowledge tends to expand among thr economic operators of the manufacturing sector, especially at cluster established in this area,we find defining elements such as: portal enterprise web applications, internet, intranet, extranet, e-learning platforms, a number of limited content management aplication, knowledge management applications, ERP,CRM etc.;
- The concept of e-business is becoming more popular, it was implemented first time by IBM, which involves the integration of a wide range of services, such as customers serving in cooperation with other business partners, e-commerce platforms, CRM, ERP, cloud services inside the company.(Bolcaş, 2011);
- Managerial communication, management techniques and decision methods will be influenced by information exchange. Access to information as quickly as possible involves: changing organizational goals, changing of organizational structures, diversification and modernization of collecting, recording and transmitting information, leading to reduced costs and saving time in the decision process;
- The "Online store", whose architecture we can find at a cluster architecture is highlighted by the figure 2, below;
- Business Management is an ERP solution (Enterprise Resource Planning), which helps companies to improve their effectiveness, organize and streamline daily operations of the business processes. Business Management allows all information to "flow" easily and quickly between all areas involved in various business processes, that enable their automation and storage.

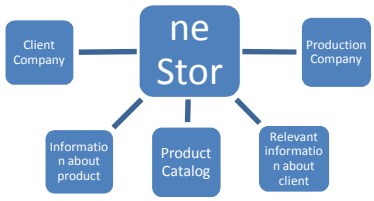

Fig. 2 - Architecture of an online store (Bolcas, 2011, op.cit).

Regarding the managerial - methodological component

- If we take on the premises that this subsystem is the most dynamic, the most sophisticated, the most algorithm-based one and that it has a major contribution tomaking the managers' work more scientific, then the reengineering of this subsystem must also lead to major mutations in how the other management processes take place and on the other components of the managerial system of the organization;
- The first specific tendency of the transition to knowledge-based organizations and knowledge management is reflected in the adaptation of different management instruments, such as management by objectives, profit center-based management and project management, to the requirements of the new statute of the organization; our proposal is focused on making operational and innovative use of management by objectives in small firms, on one hand, and widespread promoting of profit center-based management and project management in medium and large sized businesses, on the other hand;
- The management by objectives system has to be implemented in an innovative way, this meaning that, in small enterprises, an expert or the manager / owner of the business – who holds various knowledge regarding how to promote and implement this system in his organization, as well as knowledge on how the organization continues after this implementation – is in charge of dissemination, application / testing and harnessing this knowledge. Through simple ITapplications, he forwardsthe information (which was debated on in a participative manner) on the objectivesand the necessary knowledge to implement this objectives, whileas the other clasical types of resources are

provided; feedback is also provided by asimplified dashboard that records the degree of the attained objectives, the results and the causes of exceedances or failures;

- In medium and large companies, it is recommended, as stated above, to use profit centers based management and project management, separately or together. Implementing in a creative and innovative manner these complex methods of management requires the existence of both knowledge managers and knowledge specialists, and also the "online shop" in order to replenish the implementation and the operational functioning of the enterprise with its new profit centers, with various data, information and knowledge on the subject. Most medium and large enterprises in the production industry have such staging of the production process itself and the differences are coming from the degree of technical and technological level of the company, the level of training and qualification of the human factor and the professionalism of the managers.Given that the companies in this sector are specialized both technologicaly and by object (blanks obtained after each sequence of the technological process may be marketed as such finished products or they may continue the route to become end products which company the company is an expert on) the first noveltyemerged and was consolidated: each of the profit centers chosen has turned into a "business format", led and conducted by a manager (which is called"T-manager") bearing responsibility for achieving the performance targets. As a profit center isbroadly, but not fully, independent in decision-making and operational management, the first condition required in order to meet the condition of being "part of the whole" is the participation in the accomplishment of the strategic and first derivatesobjectives of the company.After meeting its obligations to the parent company ("the mother company"), the profit center may produce "for itself", within existing production capacity and market requirements, whilst the surplus is being used to motivate its additional components. Any boycott from a profit center should not be allowed,so as to this purpose there is a management contract between the companies's management and each profit centers' manager, a contract with firm rights and obligations for each party involved. The T-manager of the profit center must have an updated database, information and knowledge on the demand, the quality of the products, average selling prices, types of products sold and other type of information (to which hey all employees of the profit center have access), analyze it and, in consultation with its subordinates, adopt the necessary decisions. Recently, the business can be in a franchised format, in which case we have an increase in the manager's responsibility.
- The temptation to sell quickly and in blank favorable terms, decreases as the business format is a franchise, because the manager of such a businessdoes not risk not fulfilling contractual clauses that bind the company to which it belongs. We reffer again to the "online shop", specific to virtual companies, but which can become operational under the current circumstances, recipients (buyers) of the knowledge being the business format, through their managers. Benchmarking must operate within the company, whilst the experience and the best practices specific to one business format should be harnessed within the other profit centers also.Thefavorable economic results achievedby a profit center allow a refurbishment of its production line or additional investments in product quality, in the environment and in managerial and professional training. In this way, each business format becomes not only a "buyer" (consumer) of knowledge, taken from others, but also a "seller", a diffuser of knowledge concerning management practices, economics and production best practices. Directors or managers of the profit centers become genuine T-managers; the horizontal component of the "T" is very pronounced and represents the exchange of knowledge between them, on the degree of achievement of the objectives, on their decisions, on solutions to solve critical problems encountered in a given timeframe, on the cost of one operating hour, on deficit or surplus of the production capacity, on scientific news recently assimilated and the possibly to use them in the company etc.Basically, they constitute a powerful informal group, a type of "daisy", where the informal leader is the best informed director from the most profitable center. On the other hand, the vertical component of the "T" manager involves the exercise of authority vis-à-vis subordinates placed on the hierarchical level immediately below and working with a manager on thenext higher hierarchical level; in both situations, knowledge is transmitted and received and it concerns monitoring the implementation of decisions, assuring compliance with standards of management procedures or the promotion of various methodological elements;
- If we extend the issue of T-Managers in the area of clusters, we admit that in this area the exchange of experience in knowledge has an onvious role horizontally, between the managers of manufacturing companies, between them and specialists providers of know-how and continuous education on the one hand, and representatives of local government, on the other hand.This horizontal

transfer of knowledge can help to solve complex problems, such as "narrow places" and "places large" registered in determining the size of the production capacity from one manufacturer or another, environmental protection by harnessing biomass, identifying "gaps" and "pluses" in terms of strategic knowledge, by fundamenting and developing knowledge strategies witin the cluster and in the productive companies. Moreover, the cluster offers the advantage of professionalisation for the T-managers, through the acquisition of knowledge, especially technical and technological knowledge acquired by the cluster, as buyers from universities, R&D organizations of R & D, in the position of sellers by knowledge brokers (central or local authority representatives);

- In regard to project management, its promotion and implementation may be an independent, stand-alone one or in the context of profit center based management. In the latter case, the team or project team can and should be treated as a profit center. In both cases, project management is recommended to firms seeking to innovate faster, better and in better terms of efficiency and the projects are of a strategic nature, very complex and have an appreciable innovative size.Whichever organization type of project management is called on to resolve these projects - project management with facilitation, project management of individual responsibility, project management with staff or mixed project management - the project management system ensures the use of knowledge specialists (as part of project team, having trained in similar situations), of project managers close to what we call T-managers, also the use of matrix structures, with high functionality without templates and without specific stiffness of the functional hierarchical structures. At the same time, the project team is a veritable "deposit" of knowledge, capable of quick and valid solutions for some of the problems the company is faced with. The other managers and specialists of the enterprise also take part, practically, in such processes.

The organizational culture is an important factor through which human resources management helps the development of knowledge management. The organizational culture of knowledge-based firms essentially has the following characteristics:

- Holds the accent on people and knowledge, not on material elements;
- Is open towards internal and external stakeholders;
- Focuses on meeting consumer demands;
- receptive to news in all fields or domanins of expertise of the company;
- is supportive for knowledge sharing;
- is centered on individual and organizational learning;
- helps the creation of "new" and brings innovation in all activities of the organization;
- puts an intense focus on employee participation in decision-making;
- assures incentives for taking risks, actions and performance;
- is based on fairness and mutual respect for all stakeholders, tolerance for errors and failures, particularly in innovation;
- is a promoter of change in all areas of activity of the company;
- is protective of their employees' and other stakeholdersknowledge;
- focuses on sustainable group performance;
- places emphasis on nursering understanding, collaboration and cooperation between specialists (Todorut, 2011).

Conclusions

Although, in theory, knowledge management is a science on which specialists have not yet reached a consensus, due to extremely numerous and complex approaches, it is clear that the practice has greatly advanced and knowledge organizations are evolving in this environment, despite the difficulties. To facilitate the transition of the organizations to this level which allows them to be sustainable, actually the level of knowledge based organization, we proposed to combine the Romanian reengineering model with the features the organizations needs in order to build itself from a managerial pont of view, holding knowledge as a center piece.Addressing objectives - processes - structures - people - performance, in the context of knowledge management, is the solution that enables organizations to adapt to the changing environment, because this entails features of efficiency, effectiveness and adaptability in companies. In addition, the implementation of knowledge

management is not a very easy process, but it involves certain attitudes and knowledge of all human resources involved in this transformation, so it is highly appropriate that this change be made against the background of the reengineering model. Thus, the cycle will end with visible results, with performance that will lead to organizations whch are strong, adaptable and flexible in terms of management, ie knowledge-based organizations.

The Effect of Foreign Direct Investments on Primary Industry in Emerging Economy: Case of Eurozone in the Light of Current Economic Instability and Uncertain Economic Climate

Alexandra Bratu, Bucharest University of Economic Studies, Bucharest, Romania,
alexandrabratu89@yahoo.com
Camelia Stefan, Bucharest University of Economic Studies, Bucharest, Romania,
camelia.barabas14@gmail.com

Abstract

Over the years, foreign direct investments have been viewed as majorly the activities that contribute to the economic growth of any nation and are well known as a very important part in the economic growth of developing countries. Foreign direct investments play an important role in promoting economic growth in the Eurozone, and the employment rate is an important aspect of economic development. Eurozone has 19 countries of 28 European Union member states. It consists of developed countries, so they are emerging economies. In order to have a better understanding of the relationship between investments and employment in the Eurozone, this paper examines macroeconomic data to measure the effect of FDI inflows on employment rate in the primary sector. One of the questions addressed in this article is related to the existence of a significant relationship between the foreign direct investments and the employment rate in the Eurozone between 2000 and 2015. The main purpose of the article is to estimate the relationship between FDI and employment rate in the primary sector by employing a Vector Autoregressive model.

Keywords: Eurozone, FDI, economic growth, VAR, primary industry

Introduction

There is a small variety of conclusions that resulted from the empirical studies on the relationship between FDI and employment in the primary sector. Some economists found that inflow of foreign direct investments can contribute to the increase of productivity of all companies, including the ones that haven't directly received foreign capital. (Misztal, 2010)
Balcerzak & Zurek (2011) studies the influence of foreign direct investment on labour Markets by employing a VAR methodology for the period 1995-2009. They prove that there are interdependencies on the short term between FDI and employment and conclude that investment in high-tech industry is likely to bring many spillover effects in improving the economic situation of a country. Therefore, the government policies should focus on this kind of FDI inflows.
On the other hand, other authors analyze if the unemployment problem can be solved through economic growth, exports and FDI. By using econometric techniques of cointegration and Granger causality tests, they investigate the relationship between unemployment, economic growth, exports and foreign direct investment. (Ozughalu, Ogwumike, State, & State, 2013)
The paper is divided into the following sections: the next describes the methodology. The following section describes the data, the estimation procedure while the last section of the articles provides the results and the conclusions of the main findings as well as their implication for policy.

Methodology

The econometric model employed for the analysis is a Vector Autoregressive model. The software used is STATA. The VAR model has the advantage that captures the linear interdependencies among multiple time series (Koop & Onorante, 2012). In order to estimate the VAR model, the stationarity of the data should be tested by using the Augmented Dickey-Fuller (ADF) test.

Econometric Model

The econometric model accounts for the impact of FDI on Primary Industry in Emerging Economy while considering for economic instability and uncertain economic climate via the use of appropriate independent variables.

The paper examines the relationship between FDI and employment rate in the primary sector in Eurozone in the period 2000-2014, by estimating the following models:

$$FDI_t = \alpha_0 + \beta_1 E_t + \varepsilon_t$$

$$Y_t = \alpha_0 + \alpha_1 FDI_{t-1} + \alpha_2 FDI_{t-2} + \alpha_3 Y_{t-1} + \alpha_4 Y_{t-2} + \alpha_5 E_{t-1} + \alpha_6 E_{t-2} + \alpha_7 TO_{t-1} + \alpha_8 TO_{t-2} + \alpha_9 CPI_{t-1} + \alpha_{10} CPI_{t-2} + \alpha_{11} M2_{t-1} + \alpha_{12} M2_{t-2} + \varepsilon_t$$

$$E_t = \alpha_0 + \alpha_1 FDI_{t-1} + \alpha_2 FDI_{t-2} + \alpha_3 Y_{t-1} + \alpha_4 Y_{t-2} + \alpha_5 E_{t-1} + \alpha_6 E_{t-2} + \alpha_7 TO_{t-1} + \alpha_8 TO_{t-2} + \alpha_9 CPI_{t-1} + \alpha_{10} CPI_{t-2} + \alpha_{11} M2_{t-1} + \alpha_{12} M2_{t-2} + \varepsilon_t$$

Data

The following table contains the description of the variables included in the model.

Y	*= GDP per Capita (US dollars)*
FDI	*= FDI as a percentage of GDP in the Primary Industry (mil. USD)*
E	*= Employment Rate in the primary sector (%)*
TO	*= Trade Openness i.e. the ratio of export and import as a percentage of GDP (%)*
CPI	*= Inflation Rate in the economy (to capture economic climate) (%)*
M_2	*= Money Supply in the economy (to capture economic climate) (% of GDP)*

The sample period is 15 years (2000-2015) due to limits on the availability of data, which is sourced from the World Bank and Eurostat. Because in this article we are using annual data, the first step in analyzing the time series is to see the graphic of the observed value in time.(Brooks, 2008)

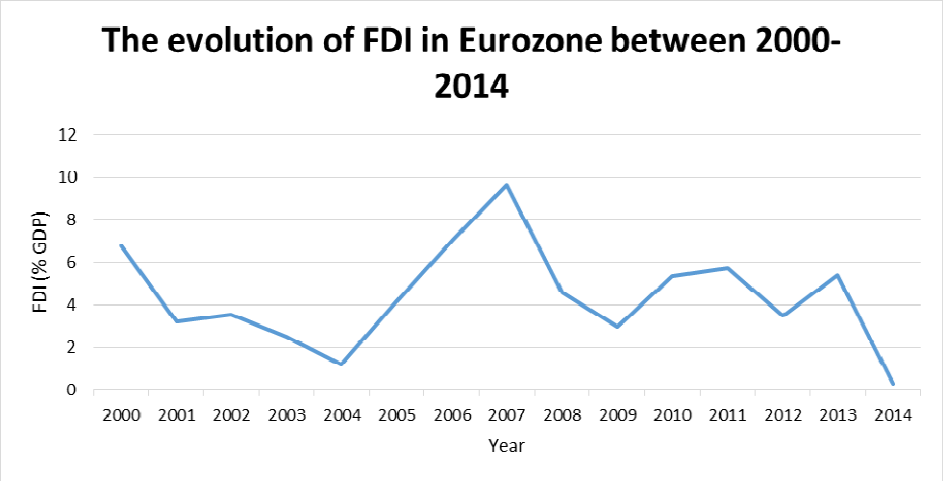

Fig 1. The evolution of FDI in the Eurozone between 2000-2014

The figure above presents the foreign direct investment in Eurozone between 2000 and 2014. By seeing this graphic, it can be observed that there is a continuous decrease in FDI starting with the year 2000 and ending with 2007. It can also be observed that in 2007 the investments in Eurozone rose.

The goal of the summary statistics is to calculate the mean and the standard deviation. For example, we can see that between 2000 and 2014 the mean of the employment rate is 67.93% while the

average inflation rate is 2.23%. Furthermore, the standard deviation is 1.30% for the employment rate and 0.92% for the inflation.

The variables are tested for stationarity by using the ADF test before the VAR estimation is conducted. The test results suggest that the first difference of GDP/capita, FDI, trade openness and money supply is stationary, which means the series are integrated of order 1, I(1).

Results & Conclusions

The estimation results for the first equation are the following:

$$FDI_t = -4.82 * E_t + \varepsilon_t$$

All the coefficients are significant at 10% level the F-statistic is 0, which means the model is valid. For this linear regression model that includes foreign direct investment and employment rate, we observe that the investments have a negative effect on the employment rate in Eurozone. This result corresponds to the economic theory.

The results of the estimation can be written using the following models:

$$E_t = 92.21 + 0.55 * FDI_{t-1} + 0.47 * FDI_{t-2} - 0.11 * Y_{t-1} + 0.008 * Y_{t-2} + 8.13 * E_{t-1} - 6.95 * E_{t-2} + 0.28 * TO_{t-1} - 0.33 * TO_{t-2} - 3.09 * CPI_{t-1} - 1.09 * CPI_{t-2} + 0.024 * M2_{t-1} - 0.15 * M2_{t-2} + \varepsilon_t$$

In the model above, the probability values are statistically significant for all the coefficients. However, the relationship between employment rate in the primary industry and GDP is not significant because this is close to 0.

The second model estimated using the VAR method is:

$$Y_t = 129461.4 + 819.11 * FDI_{t-1} + 1395.38 * FDI_{t-2} - 21.27 * Y_{t-1} + 12.54 * Y_{t-2} + 13826.77 * E_{t-1} - 11547.04 * E_{t-2} + 506.83 * TO_{t-1} - 437.33 * TO_{t-2} - 6688.47 * CPI_{t-1} - 2824.6 * CPI_{t-2} - 28.52 * M2_{t-1} - 367.17 * M2_{t-2} + \varepsilon_t$$

The interpretation of the above model is the following: if there is a 1% increase in the past employment rate, the GDP/capita will increase by 13827 EUR per capita. In the Eurozone, a 1% increase in the past foreign direct investment, gross domestic product will increase by 819.11 EUR per capita. The effects of the lagged foreign direct investment on GDP per capita is small. An increase in trade openness will become in an increase at gross domestic product.

This paper shows that link between foreign direct investment and employment rate in primary industries and the influences of employment are indirect, and at 1% increase in employment rate, foreign direct investment decrease with 4.82.

This paper shows that it is not easy to draw any general conclusions or build any assumptions in relation to interdependencies between investments and employment. The above results can be considered an empirical basis for some advice for economic policy in Eurozone. For the overall national economy of the Eurozone, FDI didn't show a significant relationship with employment in the primary sector. However, there are some situations when FDI inflow brings positive results for the labour market and on the long term, policymakers should form good conditions for improving the quality of labour force and as a consequence, increase the employment rate.

The Eurozone can attract more investments in the future, by focusing on the primary sector. Therefore, the primary sector may need the infusion of economic support in general and especially a

great inflow of FDI in order to sustain the work opportunities in rural area and avoid the mobility from the primary sector to the secondary and tertiary ones.

In order to reduce the erroneous development policy, the Eurozone should focus on international capital mobility. As a consequence, policymakers should design such policies in order to encourage investment and to make conditions for positive long term influence of foreign capital inflow on Europe labour market.

The Eurozone can attract more investments for the countries affected by the crisis, i.e. Greece, Spain, policy makers can influence the economic status, can create opportunities for these states, should design such policies in order to encourage investment and to make conditions for the positive long-term influence of foreign capital inflow on the labour market.

Abstract

This study examines the effects of exchange rate volatility and capital inflows on the economic growth (GDP) in Nigeria between 1970 and 2013. The study used FDI and remittance which proved to be most vital components of Foreign Capital inflow to Nigeria currently as demonstrated by various literature to proxy capital inflow. The result of our Generalised Method of Moments (GMM) estimator shows that F0reign Direct Investment (FDI), Capital, Financial Development (FD) had significant positive effects on Gross Domestic Product (GDP) while Remittance, the lag value of Exchange Rate Volatility ($EXRV_{t-i}$), Financial liberalisation (FL) and Labour force had significant negative effect on GDP. On the other hand, Exchange Rate volatility (EXRV) has positive but insignificant effect on GDP. This study therefore enjoined the present administration in Nigeria to provide enabling financial and infrastructural environment that will attract the inflow of FDI to agric sector, solid minerals and agro allied industry which the government intends to use as vocal points to diversify the economy from present dependence on failing oil revenue. Equally economic policy that will encourage more of the remittances inflow to Nigeria to productive investment rather than consumption which has no positive impact on economy should be enthreshed into Nigeria financial policy. Finally, more financial reforms that will not only improve financial inclusion especially at the rural sector but that will also remove totally the negative effect of EXRV on economic growth should be introduced into Nigerian financial system.

Keywords: Exchange rate volatility, Capital inflows, Economic growth, Saving- Investment gap, General Method of Moment and Nigeria

Introduction

Nigeria is the largest economy in Sub-Sahara Africa, which is monoculturally dependent on oil revenue in the last few decades. However, due to the dwindling oil revenue arising from the fall in international oil prices, the nation is currently facing an economic downturn. This trend is making the current administration in Nigeria to think along policy shift from overdependence on oil to agriculture, solid mineral and agro allied industries. It is on record that Nigeria is a toast of the world for business expansion based on her endowment of both human and natural resources as well as her rich population. Notwithstanding the above positive prerequisite, the lean purse of the Nigerian government did not encouraged the development of the necessary infrastructures for economic development that could attract foreign investment to the nation (Kumura and Todo, 2010; Selaya and Sunesen, 2011). Since this policy shift is vital to the future development of the nation, the policy

makers must consider alternative means of achieving this desire development by attracting foreign capital inflow to develop the identified sectors.

The role of capital (fund) in motivating investment cannot be overemphasised in the developing countries. Theoretical and empirical literature has applauded investment as a fundamental channel of accelerated economic growth (Agosin and Mayer, 2000). The shortage in investment coupled with the poor state of infrastructure has further been identified as a long standing obstacle to the growth of most developing countries. Moreover, it has been discovered that domestic savings in developing countries has been inadequate to bring about the investment required for steady growth. According to Ogunleye (2008) foreign capital inflow has been perceived as an important source of augmenting the savings - investment gap in most capital resource deficient economies like Nigeria. This opinion was corroborated by Elahi and Ahmad (2011) as well as Haider and Azim (2012). Thus, there is the quest to attract foreign fund across the globe to mitigate the effect of the shortfall. No wonder, in the last few decades Nigeria's dependence on foreign investors to develop its economy either in the form of foreign direct investment (FDI) or foreign portfolio investment (FPI) via stock exchange operation has been on the increase especially in the structural adjustment era. For instance FDI which was just ₦128.6 million in 1970 rose to ₦434.1 million in 1985(237.56% increase). While within the next one year (1986) after the introduction of structural adjustment programme (SAP) it almost doubled as it rose to ₦735.8 million. This geometric increase pushed FDI to ₦722, 115.34 million in 2013. In recent times, the drive for capital inflow via remittance has also been on the increase. For instance remittance that stood at $644,000 in 1970 rose to $22,000,000; $1,391,800,049 and $21,958,109,264 in 1980, 2000 and 2013 respectively.

Exchange rate volatility which is the risk associated with unexpected and unpredictable movement in the exchange rate has been proved in literature as impediment to foreign capital inflow. As a matter of fact neither low nor high exchange rate volatility is good for the economy (Chunz and Seungnoralan, 2009). The Structural Adjustment Programes (SAP) introduced by Nigerian Government in 1986 to stabilise overvalued naira was however not successful. Rather than achieving this naira has plummeted from N0.8938 to $1 in 1985 shortly before the advent of SAP in 1986 to N8.0378 to $1, N102.1052 to $1 and N159.05 to $1 in 1990, 2000 and 2013 respectively. Currently (2016) the exchange rate hovers around N300 – N330 to $1

A closer assessment of the reviewed literature reveals the following gaps that need to be filled urgently. First, majority of the literature especially on Nigeria focused on the impact of foreign Direct Investment on growth while other components of foreign capital inflows such as Foreign Portfolio Investment, Foreign Aid and Remittances were more or less excluded. The importance of these other components of foreign capital inflow to economic growth of any nation calls for fresh study that will incorporate more of these various components of foreign capital inflow in a single study that will explore the impact of foreign capital inflow on economic growth.

Secondly, there were conflicting views on the role of foreign capital inflow on economic growth. While some studies found capital inflows to be growth enhancing (Mishra et al, 2000;Edward, 2001; Klen, 2005; Ayanwale, 2007; Abhijit, 2010; Nkoro and Uko, 2012 Auragzeb and Haz, 2012) some other literature found foreign capital inflow as growth retarding (Oyinlola, 1995; Calvo et al 1996; Adelegan, 2000; Ndukumana, 2003; Rodrick and Subramanian, 2009; Kuwait and Lambarte, 2008, Ghosh, 2010; DePaula et al,2012;Rashid and Hussain, 2010) . Equally, literature is not conclusive on the effect of exchange rate volatility on economic growth. While some support the fact that exchange rate volatility improves economic growth (Froot and Stein, 1991;Blonigen, 1997; Ford, 2005) some others proffer a negative impact of exchange rate volatility on economic growth.(campa, 1993,Dixit and Pindyck, 1994)

Thirdly, most of the examined literature especially on Nigeria adopted OLS estimator techniques to estimate their econometric models. This might have been the source of the conflicting reports of findings in literature specified above. There is therefore the need to test improved estimator technique such as GMM to resolve this conflict..

This paper therefore examine the effect of exchange rate volatility and capital inflow on economic growth in Nigeria between 1970 and 2013 using GMM with a view to identify areas that require policy improvement so as to attract adequate foreign capital to grow the economy.

Literature Review

Several relevant theories on the effect of exchange rate volatility and foreign capital inflow on economic growth are available in literature. However our review will focus on theories on exchange rate volatility, theories on FDI, theories on workers remittance and some basic economic growth theories. It has been theorised that exchange rate volatility has direct impact on the economic growth however it is dependent on the level of financial development in the economy (Aghion, Howit and Mayer, 2005). In other words low financial development in the presence of high exchange rate volatility will aggravate the divergence of the economy growth from the world frontiers while a country with well developed financial system will have less adverse effect of the exchange rate volatility on the economic growth (Aghion et al, 2006). An example of this occurred in Chile between 1975 and 2000 where tremendous improvement in financial depth reduced the negative impact of exchange rate volatility buttressed this theoretically. Some other theories anchor the effect of the exchange rate volatility on the exchange rate regime in operation. While it was argued that flexible exchange rate Is highly detrimental to economic growth as it fuel exchange rate volatility, the fixed exchange rate is less detrimental to economic growth.

Many theories in literature have explained the impact of foreign capital inflow on the economy. While some theories tested how capital inflow in form of FDI affects the economic growth, some others theorised the effect of remittance on economic growth. Argawal (1991) explained the flow of FDI using three microeconomic theories namely: Electic theory, theory of differential rate of returns and the portfolio theory. In advancing the electic theory propounded by Dunning(1998,1995,1997) to explain motives behind FDI flow to another country, three main conditions considered by firms for making investment abroad were identified as firm specific ownership advantage, Location advantage and Internalisation incentives (OLI). The firm specific advantage includes competitive advantage over local firms, proprietary, technology, managerial and marketing advantages. While considering the internalisation incentive, effort must be made to ensure that the cost of exploiting the advantages is lower than the cost of sales of patient rights to the foreigners. Location advantage arise from either or combination of the low labour cost, cheap raw materials, abundant natural resources adequacy of necessary infrastructure among others. For the success of FDI, Dunning (1995) emphasised the significant role of the government in regards to monetary and fiscal policies and its ability to attract FDI flow. .Argawat (1980) criticized this OLI theory as being eclectic, static and not paying particular attention to political and sociological element. Also Rivoli and Solorio (1996) while criticizing OLI theory argued that some of the predictions of the theory may not hold especially when faced with uncertain environment.

The rate of return theory on FDI on the other hand postulates that FDI flows is a function of international differences in rates of returns on capital relative to the required rate of return. They argued that capital will naturally flow from countries with low rate of returns to countries with higher rate of returns. This hypothesis was evidenced in the work of Popkin (1965), Rueber et al (1978) and Blaise (1975). However research works by Bandra and Lacken (1978) and Walia (1975) did not find evidence to support this hypothesis. The Portfolio theory by Tobin (1958) and Markiwitz (1959) theorised that investors besides maximizing profit also endeavor to minimize their risk by way of spreading their investment in various countries. Some authors adopted this theory in their analysis of FDI flow abroad (Steven, 1968; Prachway,1972; Cohen, 1975; Rugma, 1975).

Some other theories on foreign capital inflow dealt largely with theories on workers remittance. Three theories of importance here are: Pure altruism theory, implicit family agreement theory and portfolio management theory. In advancing motives for workers remittance Kaasschieter (2014) anchored his argument on migrants concern for the welfare of their family and associate in his or her home country. However the volume of funds remitted is largely dependent on the income of the migrant and that of their family and associates at home. The second theory of workers remittance is the implicit family agreement theory propounded by Lucas & Stark (1995). Here the family agreed to

sponsor the migrant abroad on the premise that as soon as the migrant is gainfully employed he will need to remit both the principal and interest thereof back home. This theory was reinforced by the empirical work of Poirine (1997).The third theory is the portfolio management decision in which the migrant consider macroeconomic factors such as interest rate, exchange rate, inflation rate and economic policies prevalent in both home and foreign countries before taking decision on remitting fund home for investment purpose. Furthermore, Straubbaar (1986) provide empirical evidence on this theory in his research of Turkey. It is worthy of note that it is only the portfolio management decision theory that has element of investment drives which have the ability to grow the economy. The other theories are consumption oriented and bear no direct effect on economic growth.

One of the topical issues in economics from time immemorial has been that of economic growth The earlier classical economics theories pioneered by Smith(1876), Ricardo (1824)and Malthus (1798) all recognised the mechanism that influence economic growth as productive investment as well as capital accumulation. The classical economist did not make allusion to financial capital in their analysis but concentrated on physical capital. The first Economist to recognise the place of financial capital in growth theory was Keynes (1936) in his simple macroeconomic open economic model of national income where he theorised that foreign capital flow (E-M) is required to bridge the saving-Investment gap in the domestic economy. Interestingly too Harrod (1939) and dommar (1946) expanded Keynesian growth model by identifying precondition necessary for an industrial economy such as USA to attain a steady-state of equilibrium growth. The model identified three gaps of savings, trade balances and financial gaps as a limiting factor to growth which could be remedy by foreign capital inflow. This model was adapted in their studies for open economies in less developed countries by Little (1960), Chenery & Bruno, (1962), Mckianon, (1964) and Chenery and Strout, (1966). In advancing growth model further the Neoclassical economist champion by Solow (1956) postulates the place of steady state where investment is equal to depreciation as a sinequanon for economic growth. However as the capital growth overtime diminishing returns set in to make depreciation higher than investment and thereby impede economic growth. To guarantee economic growth therefore savings need to be stepped up so as to ensure the steady state. Solow therefore encourage the flow of foreign capital to improve savings required for growth in the domestic economy

Review of Empirical Review

Existing literature offers conflicting views concerning the effect of exchange rate volatility on capital inflow. While some discovered positive effect others noted negative effects. Those reporting positive effects argued that devaluation of the host country currency via exchange rate volatilityl increased FDI and vice versa because it has the capacity to increase the wealth of the foreigners as well as making assets acquisition cheaper thereby encouraging multinationals to promote local production in place of exportation to host countries (Froot and Stein, 1991; Blonigen, 1997; Ford, 2005). On the other hand, some argued that decision to invest by any company is based on expectation of profitability in future and the risk attached to the stream of future profit which in their opinion is negatively affected by the exchange rate volatility (Campa, 1993; Dixit and Pindyck, 1994).

In Nigeria, Osinubi and Amaghionyeodiwe (2009) used OLS and Error Correction model (ECM) estimation techniques to examine the effect of exchange rate volatility on FDI in Nigeria for the period 1970-2004 and discovered a significant positive relationship. This study tried to allay the worry of foreign investors on the effect of exchange rate volatility on their investment. This result was not in agreement with the outcome of the work of Ogunleye (2008) who noted that exchange rate volatility negatively influenced FDI inflow to Nigeria and South Africa. He equally noted that in both countries FDI aggravated exchange rate volatility. The position of Ogunleye (2008) was corroborated by Udoh and Egwaikhide (2008) who using GARCH model to examine the effect of exchange rate volatility and inflation uncertainty on FDI in Nigeria between 1970 and 2005 indicated that exchange rate volatility and inflation uncertainty exerted significant negative influence on FDI. The study further revealed that status of infrastructural development, appropriate size of government sector and International competitiveness are very crucial determinant of FDI inflow into the country.

Most of the reviewed literature on the effect of foreign capital inflow on economic growth adopted FDI to proxy foreign capital inflow. Interestingly, almost all of them noted a positive relationship between FDI and economic growth. At the international level, Soltani and Ochi (2012) while examining the effect of FDI inflow on GDP of Tunisia between 1975 and 2000 noted that FDI promoted long economic growth in Tunisia.. This view was buttressed by Insah (2003) in his dynamic OLS study of the impact of FDI flow to Ghana between 1980 and 2010 noted a positive impact on GDPin Ghana. Still on Ghana, Aveh, Krah and Dadzie (2013) came up with slightly different result. Their study using 2SLS and quarterly data from 2004 to 2011 shows that there was an insignificant positive relationship between FDI and economic growth in Ghana. This shows that model specification and methodology of data analysis could determined the outcome of the result. Lee (2007) took a different approach in his study of the effect of FDI on economic growth in Vietna. He noted that the positive impact of FDI flow to Vietna on GDP was activated through the spillover effects of technological transfer brought about by the GDP. The same position was taken by De Grorio & Whalee (1998).in their study.

Nigeria's experience shows that there was positive effect of FDI flow to the country on the economic growth regardless of the method adopted. Some literature in Nigeria for instance used OLS technique of estimation to study the effect of FDI on GDP and came up with a positive result (Ayanwale, 2007; Adofa, 2009; Abu and Achegbolu,2011; Egbo, 2011). On the other hand some literature used Johansen Co-integration test and Vector Autoregressive (VAR) within Vector error correction model to study the impact of FDI flow on GDP in Nigeria and they all obtained positive effect of FDI on economic growth of Nigeria.(Okodua, 2008; Egwaikhide,2012, Ogunmuyiwa & Ogunleye, 2011). However the only negative voice to this discussion was that of Oyinlola (1995) who arrived at the negative effect of FDI on economic growth using the two-gap model.

Looking at the impact of FDI on economic growth from different perspective, Dutse (2009) noted that FDI affect economic growth through the spillover effect of FDI on technological and efficiency. Ayanwale (2008) and Egwaikhide (2011) in their different studies examined the impact of FDI on sectorial output. They both noted positive impact of FDI on telecommunication while insignificant positive effect was noted on real sector such as agric, mining, petroleum and manufacturing sector.

Some other authors studied the effect of ODA on economic growth. For instance, Burnside and Dollar (2000) in his panel data study of 56 countries using 2SLS estimation technique discovered that ODA had robust impact on economic growth of the selected countries but he was quick to add that this is dependent on good policy environment. This position was supported by Hansen and Tarp (2001) in their panel data analysis of the effect of ODA to 56 countries between 1970 and 1993 where they noted that ODA increased economic growth. In his study of the impact of ODA on GDP of 67 LDCs between 1970 and 1988 Bowen (1988) took a different approach by examining the direct and indirect effect of ODA. He noted that direct aid had no significant effect on economic growth while indirect aid had significant effect on economic growth via its interaction with domestic savings. Most of the studies on Nigeria noted positive effect of ODA on economic growth regardless of the analysis method adopted (Fasanya, and Onakoya, 2012;Mba Bell-Gen and Ubi, 2012; Bashir, 2013). The only disserting voice here is that of Bakare (2011) who noted a negative relationship between ODA and GDP.

Most of the studies that used remittance to proxy foreign capital inflow in their study of the impact of foreign capital inflow on economic growth both internationally and in the local Nigerian context found a positive relationship between remittance and economic growth (Glytson,2005; Fayisa, and Nshar, 2008; Malik and Junaid, 2009;Iheke, 2013; Ukeje and Obiechina, 2013).

Some other authors in the quest to find robust analysis of the effect of foreign capital inflow decided to apply more than one components of foreign capital inflow (FDI, FPI, ODA and Remittance) to carry out their study. In this situation some authors applied FDI and FPI as a proxy for foreign capital inflow in their studies and noted positive impact of FDI on economic growth and negative effect of FPI on economic growth (Soto, 2000;Shen & Lee, 2010; Shabbir & Asher, 1992). Some other literature selected ODA and FPI as a proxy for capital inflow and noted positive impact of ODA on economic growth while FDI has negative or no impact on economic growth (Gupta and

Islam, 1993; Khan & Rahim, 1993). Some other literature adopted ODA and FDI and discovered that ODA impact positively on economic growth while FDI retards economic growth (Stoneman, 1975; Oyinlola, 1995). The only study that adopted FDI, ODA and FPI in his study was Shabbir & Azher (1992) who noted significant positive impact of FDI on economic growth while ODA had positive impact on economic growth but FPI had significant negative impact on savings and by extension on economic growth.

Deduction from the above is that FDI, ODA and Remittance have a positive impact on economic growth while FPI has negative impact on economic growth. However the effect may differ depending on model specification and method of analysis.

Model Specification

This study adopts a model developed by Borensztein, De Grezorio and Lee (1998) and Fry (1997) including Bosworth and Collins (1998). This model will be constructed to test the effect of FDI, Remittances and Exchange Rate Volatility (EXRV) on economic growth as represented by GDP in Nigeria. Overall a model of the impact of capital flow on economic growth must identify the role and relative capital on the rate of economic growth. Here foreign capital flow is used as input in addition to labour and domestic capital stock.

The model starts from general production function given by Solow which is explicitly given as:

$$Y = f(K,L,A) \quad (1)$$

Where Y = GDP

K =Capital input (capital formation in an economy which is equal to domestic Investment + foreign capital inflow).

L = Labour input

A = the level of technological knowledge.

If we decompose capital to physical capital (K) and financial capital (FDI and REM.) as presented by Balassa (1978), then we have:

$$Y = f(K,FDI, REM ,L,A) \quad (2)$$

In Asian developing countries financial liberalization or openness is used as indicator of technological knowledge. This is based on the assumption that financial liberalization or openness provide and impose a higher efficiency on financial system and the economy. If we denote financial liberalization as FL, then substituting we have:

$$Y = f(K, FDI, REM., L, FL) \quad (3)$$

Financial development as represented by FD could be introduced into the model. We introduce this variable because the level of financial development in a given economy will help to explain the extent to which capital introduced into an economy can be effective. Therefore we have:

$$Y = f(K, FDI, REM, L, FL, FD) \quad (4)$$

Note that the level of financial development could be proxy by money supply(M_2).

We can also introduce other variables of interest into the model. This in our own case is the Exchange rate volatility (EXRV). Thus the equation becomes:

$$Y = f(K, FDI, REM, L, FL, M_2, EXRV) \quad (5)$$

From the implicit model above, we therefore proceed to build our explicit model thus:

$$Y = \propto_0 + \propto_1 K + \propto_2 FDI. + \propto_3 REM + \propto_4 L + \propto_5 FL + \propto_6 M_2 + \propto_7 EXRV + U \quad (6)$$

The apriori expectation provides the expected significance of the values of the coefficients to be estimated, We expect the coefficient to have the following signs:

$\propto_0 > 0$, $\propto_1 > 0$, $\propto_2 > 0$, $\propto_3 > 0$, $\propto_4 > 0$, $\propto_5 > 0$, $\propto_6 > 0$, $\propto_7 < 0$.

The role of capital inflow (FDI, REM) which is counted as endogenous variables in process of economic growth is explained by the fact that in developing countries, the gap of domestic savings and investment is lagged and foreign capital plays a key role in the development process. It is therefore supposed that foreign capital flow raises capital stock and increased capital formation which will in turn lead to increase in the growth of GDP.

Estimation Techniques

The study employs annual time series data for Nigeria between 1970 and 2013 which will be analysed using econometric techniques. A simple ordinary least square (OLS) method of estimation will be used in the first instance on equation 6 since it is efficient, sufficient and best linear unbiased estimator. However because of the inconsistency of the result of OLS in literature, we shall equally adopt the Generalised Method of Moments (GMM) estimators which provide consistent estimators when lagged of dependent variables are used. This is necessary in order to overcome the problem of endogeneity that is inherent in the long run growth determinants in line with Arellano and Bond (1991). This modified method was adopted in similar studies in Pakistan and other related studies (Malik and Junaid, 2009; Aghion P. et al, 2006; Gunther S, 2007; Benhima K. 2013; Hanseith and Tarp F, 2000; Carerera and Vulesin, 2003). This method is widely used by other studies because of its consistency (Chang and Ying, 2008; Aghion, Howwitt and Martins, 2010; Islam, 2010; Hokayem and Ziliak, 2011). In applying this method, the explanatory variables are instrumetalized with their suitable lags so that the instruments are not correlated with the error term.

GMM is a dynamic model estimation technique which is valid because the instruments (Variables) are exogenous implying that the over identified restriction on instrument is valid (Roodman, 2006). The two popular and similar tests of over identifying restriction hypothesis in GMM estimates are the Satgan (1958) and J- Statistic of Hansen (1982) tests. They both test the Null hypothesis that the overidentifing restrictions are valid. A rejection of this null hypothesis implies that the instructions are not satisfying the orthogonality conditions required for their adoption; the instrument are not truly exogenous or heteroscedasticity problem is in existence as against Homoscedasticity assumption in Sargan tests (Baaun, Schaffer and Stillman, 2003). It has also been shown that the presence of intra – cluster correlation can cause an over-identification statistics to over – reject the Null hypothesis (Hoxby and Paserman, 1998).

Therefore this study adopted GMM. Taking the first-difference transformation of equation 6, the fixed country-specific effect and the correction between the error terms and the lagged dependent variables are removed, specifically for lag order greater than or equal to 2 then we have.

$$\Delta Y_t = \alpha_1 \Delta Y_{t-1} + \alpha_2 \Delta K_t + \propto_3 \Delta FDI_t + \propto_4 \Delta REM_t + \propto_5 \Delta L_t + \propto_6 \Delta FL_t + \propto_7 \Delta M_2 + \propto_8 \Delta EXRV_t + \Delta U_t \quad (7)$$

Estimation of Exchange Rate Volatility

We adopt the Standard Deviation of the first difference of logarithms of the exchange rate in estimating Exchange Rate Volatility. Here the change in exchange rate is computed over one month using end of month data. The standard deviation is calculated over a one year period as an indicator of short run volatility as well as over a forty three years period to capture long run variability.

The first order difference (FD) measures consider the difference between the current logarithm value of exchange rate and the previous value. It is defined as:

FD_t = ($inEXR_t$ - $inEXR_{t-1}$)- in $\overline{EXR}$

Where EXR = Bilateral exchange rate.

$\overline{EXR}$ = The mean of the bilateral exchange rate.

In = Natural log.

The second measure of standard deviation of the growth rates of exchange rate (SD^{43}) is approximated by time – varying measure defined as follows:

$$SD_{t+m} = (\frac{1}{m}\sum_{i=1}^{m}(inEX_{t+i-1} - EXR_{t+i-2}\ )^2]^{1/2}$$

Where m = the order of moving average.

The last alternative measure of the exchange rate volatility is defined as the time-varying twelve months co-efficient of variation (CV) of the bilateral exchange rate (this is in fact a measure of dispersion of the real exchange rate). It is define as:

$$CV_{t+m} = \frac{\{\frac{1}{m}\sum_{i=1}^{m}(\ inEXR_{t+i-1} - EXR\ )^2\ \}^{1/2}}{\overline{EXR}}$$

Where $\overline{EXR}$ is the mean of the bilateral exchange rate between month t and t+m.

Sources of Data

Data on various variables to be used in the study such as Exchange rate, GDP, FDI and money supply, were sourced from volumes of the Central Banks of Nigeria (CBN) Statistical Bulletin. On the other hand, data on Workers' remittances, Capital and labour were sourced from the World Development Indicator (WDI). Exchange rate volatility was computed by the author by applying standard deviation on the exchange rate data collected from CBN Statistical Bulletin.

Results and Discussion

We present the table of our results of both OLS and GMM estimation techniques below. The results of the effects of the variables of interest in both methods of estimation were almost the same with minor variations. Since GMM has already helped us to overcome the problem of autocorrelation and heteroscedasticity inherent in OLS, we stick to GMM analysis in this paper.

The R- Squared of 0.986413 shows that the variation in dependent variable (GDP) was 98.64 percent jointly explained by all the explanatory variables (L, K, FDI, REM. FL, FD and EXRV). The Adjusted R^2 of 0.982531 shows that the model has high goodness of fit as the explanatory power of this model is approximately 98 percent of the total variation in GDP. The validity of the instrument in the estimation was justified by the Prob. J- Statistics of 0.999404 which is closer to 1.0. Also the

standard error of all the variables which lies between 0 and 1 indicates that the coefficients of the estimator are reliable.

We now examine the effect of each of the explanatory variables on the growth of the Nigerian economy. The coefficient of FDI which is 0.063944 shows that there was positive but very significant effect of FDI on GDP as demonstrated in the probability of 0.0000 In other words a percentage change in FDI lead to 0.064 percentage change in GDP. This shows that FDI has great impact on economic growth of Nigeria between 1970 and 2013. This could have been the direct implication of this kind of inflow on local investment, employment and indirectly on consumption. This therefore suggests an area of policy shift for government to meet her current economic diversification strategy.

Remittance on the other hand had significant negative effect on the Nigerian economy as evidenced in its negative coefficient of 0.026961 and probability of 0.00000.This shows that a one percent change in remittance will lead to 0.068 percentage change in GDP. This result was contrary to empirical evidence in previous literatures on Nigeria which produced positive relationship between remittance and economic growth (Iheke, 2013; Ukeje and Obiechina, 2013; Kanu and Ozurunbo, 2013). However literature that support negative impact of remittance on economic growth anchored their argument on the fact that remittance only have direct impact on consumption and not on investment and therefore could not form capital formation required for economic growth (Karagoz, 2009; Sanni and Mohammed, 2012). In particular Sanni and Mohammed (2012) found negative effect of remittance on MENA countries economic growth between 1970 and 2009 while examining channels through which remittance can promote economic growth in these countries. They concluded that remittance was consumed and thus could not stimulate growth which could only be stimulated by investment.

The negative effect of remittance on economic growth in Nigeria could be justified by the fact that most of the fund that come to Nigeria via remittance were consumed rather than invested. Effort should therefore be geared towards encouraging remittance flow towards investment that could lead to both human and physical capital accumulation.

Exchange rate volatility which is one of the key explanatory variables of interest in this study shows an interesting position. Here there is positive and significant effect of EXRV on GDP as evidence in its coefficient of 0.005670 and probability of 0.0000 this is contrary to the theory which specified that EXRV has a negative effect on GDP. But a study by Aghion, Howit and Mayer (2005) opined that the extent of financial development will dictate the impact of EXRV on economic growth. For instance a lower degree of financial development with high EXRV will aggravate the divergence of the economy growth rate while a country with well developed financial system will neutralize the negative effect of EXRV. The various reforms implemented by Nigeria's government overtime might

have explained the positive effect of EXRV on GDP in Nigeria. Such reforms include financial structure reform; monetary policies reforms; foreign exchange market reforms; liberalisation of the capital market and capital market reform. However we extend the study further to see the lag effect of EXRV for one period on economic growth. The outcome shows a negative but significant effect of this lag value of EXRV on GDP as evidenced in its negative coefficient of 0.024395 and probability of 0.0000 shown in the regression table above. This is the only situation that corroborates the theory on exchange rate volatility.

Financial liberalisation was found to have negative but highly significant effect on economic growth. This shows that a percentage increase in financial liberalisation will lead to retardation in economic growth by 0.185 percent. Therefore policy formulators must be careful about the level of financial liberalisation to be accepted in the economy. On the other hand financial development was also found to have positive significant effect on the economic growth in Nigeria as evidenced in the positive coefficient of 0.883676 and probability of 0.0000 That is for every percentage change in financial development there is 0.884 percentage increase in economic growth. Financial development is required to bring about speedy economic growth required in the economy. For the economy to grow therefore much effort must be directed towards developing the financial sector of the economy so that the sector could play a big role of the engine of growth ascribed to it as normal function. Capital has a positive and significant effect on economic growth on the other hand labour has a negative and significant effect on economic growth of Nigeria between 1970 and 2013.

The objective of this study was to assess the effect of capital inflow and exchange rate volatility on economic growth in Nigeria between 1970 and 3013. The result of the general Method of Moment (GMM) regression analysis show that R^2 of 0.978808 imply that all the explanatory variables jointly explain the variation in the GDP by 97.88 percent . This was buttressed further by Adjusted R^2 of 0.985027 which imply that the model has high goodness of fit. The FDI was discovered to have significant positive effect on GDP as shown by the co-efficient of 0.063944 which indicate that a percentage increase in FDI will lead to 0.064 percentage change in GDP. We also noted that Workers Remittance have a significant negative effect on FDI as shown by the coefficient of -0.62961. This was because remittance does not have direct impact on investment but rather impacted on consumption which does not have capacity to build up capital stock.

Exchange rate volatility has positive but insignificant effect on economic growth contrary to negative effect posited by theory but which could be justified by the level of financial development prevalent in Nigeria in line with the findings of Aghion et al (2005). However, the lag of EXRV has a negative and significant effect on economic growth in Nigeria. Financial development has a positive and very significant effect on economic growth in Nigeria as demonstrated by the coefficient of 0.883576 signifying that a percentage change in financial development will lead to 0.884 percentage change in economic growth, On the other hand financial liberalisation has a negative but significant effect on economic growth in Nigeria.

Conclusion and Recommendation

The study shows that FDI has a positive and significant effect on economic growth in Nigeria which identified FDI as a focal point to channel the policy to grow the economy. On the other hand remittance has a negative effect on the economic growth in Nigeria as it affects consumption and not investment which is capable of improving economic growth. Also EXRV has positive but insignificant relationship with economic growth in Nigeria contrary to basic theory on EXRV. However this was made possible because of the level of financial development prevalent in Nigeria arising from various financial reforms carried out in Nigeria financial system.

It is common knowledge that the present political administration intend to introduce economic reform that will diversify the Nigerian economy from the present monocultural dependency on oil revenue in her quest to bail out the nation from the dwindling economic fortune. The template in particular seeks to grow the nation agricultural base, solid mineral development and local industry development. This study therefore admonishes government to provide enabling infrastructural and financial development that will attract the inflow of FDI to agric sector, solid mineral sector and agro allied

industry. This will help to bridge financial, technological and managerial gap that exist in the domestic economy of Nigeria presently.

We also recommend that government should introduce financial reform that will encourage greater financial inclusion of Nigerian citizens in the financial sector of the economy. More importantly the impact of financial reform in Nigeria should not be restricted to urban areas but should equally be felt in the rural areas. In this way rural agricultural development needed to anchor the economic diversification of the present administration will be easily attainable. The space of financial development will also go a long way to further reduce the negative effect of EXRV on the economic growth.

More fiscal and monetary policies that will curtail the present overbearing control of foreign exchange by parallel market instead of real banking sector led control should be put in place. The mafia that presently control bureau de change in Nigeria should be dismantled. Government must put in place stringent control on the activities of these bureau de changes. Policy that will diversify more of remittance which is on the increase to the nation now from consumption to investment should be put in place. In this way the remittance will have direct impact on economic growth in Nigeria. Recipient household of international workers remittance should be re-oriented to channel more of the remittances to investment purpose rather than consumption so as to boost the growth of Nigerian economy.

Résumé

L'objectif de ce papier est de combler le manque de recherches portant sur l'étude de la résistance à l'adoption des panneaux solaires photovoltaïques. Cette étude vise à étudier les principales barrières techniques, sociales et économiques qui constituent des freins à l'utilisation domestique des panneaux solaires photovoltaïques et à fournir une meilleure compréhension de ce phénomène dans un pays émergent. C'est ainsi que nous nous proposons d'élaborer un modèle conceptuel explicatif de la résistance à l'adoption des panneaux solaires photovoltaïques qui s'appuie sur la théorie du comportement planifié et qui intègre les barrières techniques, sociales et économiques. Ce modèle fera l'objet d'une validation empirique auprès de chefs de ménage Tunisiens.

Mots clés

Panneaux solaires photovoltaïques, Comportement du consommateur, Théorie du comportement planifié, Barrières sociales, économique et techniques.

Abstract

The aim of this paper is to fulfil the lack of research on the issue of resistance to adopting photovoltaic solar panels. Specifically, we aim to identify the key technical, social and economic barriers to the domestic use of photovoltaic solar panels and provide a better understanding of this phenomenon in emerging countries. Thus, we intend to develop an explanatory model of resistance to adopting photovoltaic solar panels. To this end, we opted for the theory of planned behavior as the theoretical background and integrate the technical barriers, social and economicfor our study. This model will be empirically validated on a sample of Tunisian households.

Keywords: Photovoltaic Solar Panels, Consumer Behavior, Theory of Planned Behavior, Social barriers, Economic and Technical barriers.

1. Introduction

En raison de l'excès de consommation des ressources énergétiques fossiles, de l'épuisement des réserves et de leurs effets néfastes sur l'environnement, les décideurs politiques ont pris de nombreuses initiatives pour inciter à l'adoption des énergies renouvelables (Faiers, 2007) telle que l'énergie solaire photovoltaïque (ESP) qui n'a pas d'effet nuisible sur l'environnement, (Ansari et al, 2013). Toutefois, l'ESP est confrontée à un certain nombre de contraintes et de barrières qui affectent son adoption par les particuliers, (Claudy et al, 2013). La présente recherche porte sur l'étude des obstacles inhérents à l'adoption domestique des panneaux solaires photovoltaïques (PSP). Le choix de ce thème se justifie d'une part, par le fait que la résistance à l'adoption des PSP n'a pas suscité un grand intérêt de la part des chercheurs (Luthra et al, 2015) dans les pays émergents, (Hansla et al, 2008) et d'autre part, par le besoin de comprendre le phénomène de non adoption des PSP afin d'identifier les barrières à leur adoption, (Krupa, 2012). C'est à ce titre que nous nous proposons d'élaborer un modèle conceptuel inspiré de la théorie du comportement planifié (TPB) pour étudier l'impact des barrières techniques, économiques et sociaux sur l'intention d'adoption.

2. Cadre conceptuel

Nous passerons en revue les barrières sociales, économiques et techniques à l'adoption des PSP et nous présenterons ensuite la TPB.

2.1. Les barrières à l'adoption des PSP

L'adoption des PSP est confrontée entre autres à des barrières économiques, techniques et sociales, (Karakaya et Sriwannawit 2015; Rai et al, 2016; Yaqoot et al, 2016).

2.1.1. Les barrières sociales

Les barrières sociales se rapportent au manque de confiance sociale et à l'absence de soutien social, (Yun et Lee, 2015). La confiance sociale est définie comme la volonté de l'individu de compter sur des experts lorsqu'il aune connaissance limitée sur une technologie, (Earle et Cvetkovich, 1995). La confiance sociale influence positivementles normes subjectives (Yun et Lee, 2015), et le manque de confiance sociale détermine négativement les normes subjectives. D'où, l'hypothèse suivante:

H_1:Le manque de confiance sociale influence négativement les normes subjectives.

Le soutien social représente la capacité de la communauté à informer la personne sur les avantages d'une technologie et il correspond à son évaluation subjective, (Montijin-Dorgelo et Midden, 2008, Stephenson et al, 2015). Le soutien social affecte positivement les normes subjectives, (Yun et Lee, 2015). Ainsi, l'absence de soutien social exerce un impact négatif sur les normes subjectives. D'où, nous proposonsl'hypothèsesuivante:

H_2:L'absence de soutien social influence négativement les normes subjectives.

2.1.2. La barrière économique

La barrière économique se rapporte aux coûts d'acquisition, d'installation et de maintenance des PSP, (Kim et al, 2014). Bauner et Crago (2015) soulignent que plus les coûts de l'acquisition des PSP sont élevés, plus leur adoption est ralentie. Vasseur et Kemp (2013) affirment que les coûts sont considérés comme l'une des principales raisons de non adoption des PSP. Ainsi, les coûts agissent négativement sur l'attitude vis-à-vis des PSP (Claudy et al, 2013). Nous soutenons l'hypothèse suivante :

H_3: Les coûts influencent négativement l'attitude à l'égard des PSP.

2.1.3. Les barrières techniques

Les barrières techniques se rapportent aux conditions techniques non adéquates ainsi qu'à la perception de la qualité du système des PSP, (Yun et Lee, 2015). En outre, l'adoption des PSPnécessitela prise en compte de donnée personnelle telle que la superficie de la maison (Claudy et al, 2013). A ce titre, Taylor et Todd (1995) trouvent que l'adéquation des conditions techniques influence positivement le contrôle comportemental perçu. Toutefois, les conditions techniques inadéquates agissent négativement sur le contrôle comportemental perçu. Par conséquent, nous émettons l'hypothèse suivante:

H_4:Les conditions techniques inadéquates influent négativement sur le contrôle comportemental perçu.

La qualité perçue du système des PSP est définie comme la cohérence et la fiabilité des performances, (Seddon, 1997). Yun et Lee (2015) trouvent que la qualité perçue du système des PSP influe positivement sur le contrôle comportemental perçu. Toutefois, la perception d'une mauvaise qualité des PSP influence négativement le contrôle comportemental perçu. Par conséquent, nous formulons l'hypothèse suivante:

H_5:Une mauvaise qualitéperçue des PSP agit négativement sur le contrôle comportemental perçu.

2.2. La théorie du comportement planifié (TPB)

La TPB vise à prédire les comportements et à déterminer l'impact de l'attitude, des normes subjectives et du contrôle comportemental perçu sur l'intention d'adoption d'une technologie, (Ajzen, 1985).L'attitude désigne l'évaluation globale d'un comportement. La norme subjective désigne les pressions sociales perçues pour effectuer ou ne pas effectuer un comportement. Le contrôle comportemental perçu se réfère aux ressources, aux capacités, aux opportunités disponibles et à la perception de l'importance d'obtenir les résultats, (Ajzen, 1985). LaTPB stipule l'existence d'un lien positif entre l'attitude et l'intention d'adoption, (Ajzen, 1991). Sur cette base, nous soutenons l'hypothèse suivante:

H_6:L'attitude influence positivement l'intention d'adopter les PSP.

Par ailleurs, la TPBsoutient une relation positive entre les normes subjectives et l'intention d'adoption, (Ajzen, 1991). Cependant, la TPB n'a pas étudié la relation entre les normes subjectives et l'attitude. Nous nous proposons d'explorer cette relation et nous supposons que les normes subjectives agissent positivement sur l'attitude. Ainsi, les hypothèses suivantes:

H_7: Les normes subjectivesinfluencent positivement l'intention d'adopter les PSP.

H_8: Les normes subjectivesinfluent positivement sur l'attitude vis-à-vis des PSP.

Quant aucontrôle comportemental perçu, la TPB considère qu'il agit positivement sur l'intention d'adoption, (Ajzen, 1991). Mais, elle n'a pas étudié la relation entre le contrôle comportemental perçu et l'attitude. Nous admettons que le contrôle comportemental perçu influence positivement l'attitude. D'où les hypothèses suivantes:

H_9: Lecontrôle comportemental perçu exerce un impact positif sur l'intention d'adopter les PSP.

H_{10}: Lecontrôle comportemental perçu agit positivement sur l'attitude envers les PSP.

3. Le modèle conceptuel

Le modèle conceptuel proposé se présente comme indiqué dans la figure 1.

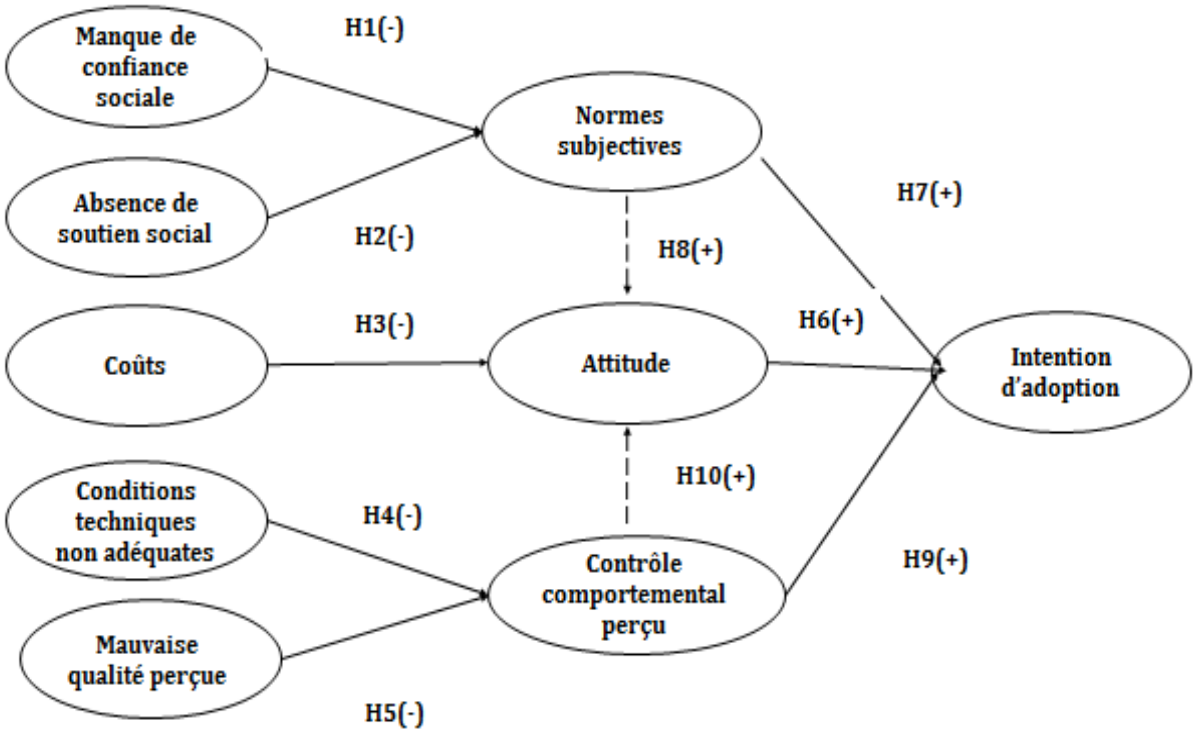

Figure 1. Le modèle conceptuel

4. Conclusion

Malgré les avantages des PSP, leur adoptionest confrontée à un certain nombre de barrières. En se basant sur une revue de la littérature, nous avons élaboré un modèle conceptuel inspiré de la théorie du comportement planifié. Ce modèle intègre les barrières économiques, techniques et sociales et vise une meilleure compréhension du comportement des particuliers à l'égard des PSP. Il constitue une contribution à l'explication du comportement de non adoption des PSP en tenant compte de trois types de barrières. Notre modèle sera testé auprès de chefs de ménage Tunisiens afin de confronter sa cohérence avec la réalité.

Abstract.

The purpose of the study is to evaluate and create an educational model based on the development of sustainable model for education. The results show significant difference in the knowledge, attitudes and intention of students in their future decision. The role of the study is to quantify the influence of the media models presented in the mass-media as models of success in a new economical market and new orientation of job market. Also the study identifies the factors of influence upon the next generation in how to choose a profession. The question that arises is whether such prominent characters in TV and mass media, abandonment causes secondary studies in motivation "they managed no school" and may succeed because "the money are everything". Study covers schools and universities population from Romania and Albania, the target are the students from high school to the end of the childhood and adult transformation aware of their role in society and the transfer in academic life perception regarding the role of education in social life.

Keywords: sustainable education, cross cultural model, model education, quality.

1. Introduction

There are diverse studies in the literature related to motivation of students, factors that motivate them in learning, choosing a profession and achievement goals and the success. Fan (2011) examined the structural relations of social influences, task values, ability beliefs, educational expectation and academic engagement for both boys and girls and he found that despite the detected gender differences, similar findings across gender groups were also noted and demonstrated in the existence of latent factor mean non-invariance between boys and girls on multiple school motivational factors and social influences.

Xu (2014), identify at the student level, that homework motivation management was positively associated with family help, peer-oriented reasons, learning-oriented reasons, homework interest, arranging the environment and managing time. Girls, compared with boys, and Blacks, compared with Whites, were more likely to manage homework motivation. Also, De Bruin *et al.* (2012) examined the relationship between motivation for using digital portfolios and reflection and he found that that motivation for composing a portfolio was fair, but not related to the amount and nature of reflection.

Hudley *et al.* (2007) described a program of intervention research to improve social behaviour and academic motivation in elementary school students organized around principles of attribution theory. Their study was focused on reducing children's aggression and was then expanded to include enhancing personal responsibility and demonstrated that children's attributions in both the social and academic domains can be changed with cost-effective, educational strategies and can produced positive changes in behaviour.

Also, Covington (2000), found that the quality of student learning as well as the will to continue learning depends closely on an interaction between the kids of social and academic goals students

bring to the classroom, the motivating properties of these goals and prevailing classroom reward structures. Raufelder *et al*. (2013), examined if social relationships in school are equally important for motivation across a large sample of adolescent students. They considered four different motivation types: teacher dependent, peer dependent, teacher and peer dependent and teacher and peer independent motivation and the results of the confirmatory latent class analysis confirmed their four latent class model. Korpershoek *et al*. (2015) investigated the school motivation of students using four motivation dimensions: performance, mastery, extrinsic, and social motivation. Their aim was to identify distinct motivation profiles using this motivation dimensions in a latent class analysis and to investigate the relationships between students' school motivation profiles and several educational outcomes (school commitment, academic self-efficacy, and academic achievement).

They found two clusters of students with consistent response patterns across all four motivation scales, two clusters of which one showed relatively high scores on mastery and social motivation and the other on performance and extrinsic motivation, and two clusters with extremely low scores on performance motivation and to a lesser extent on extrinsic motivation. The results revealed notable differences in school commitment and academic self-efficacy across the six clusters, but not with regard to academic achievement.

McInerney *et* al. (2005) found seven factors underlying facilitating conditions for school motivation: perceived value of schooling, affect toward schooling, peer positive academic climate, parent positive academic climate, teacher positive academic climate, peer negative academic climate and parent negative academic climate. They found that last two factors were correlated positively with each other but negatively with all the positive constructs and academic achievement was positively correlated with the five positive factors but negatively correlated with the two negative factors.

Otherwise, Steinmayr and Spinath (2009) examined to which extent different motivational concepts contribute to the prediction of school achievement among adolescent students independently from intelligence. They found that beyond intelligence, different motivational constructs incrementally contributed to the prediction of school achievement. Domain specific ability, self perceptions and values showed the highest increments whereas achievement motives and goal orientations explained less additional variance.

In her study, Giota (2010), showed that the first- and second-order confirmatory factor analyses were used in order to investigate the structure of the different types of academic, social, and future goals pursued by adolescents in school, and whether goals can be hierarchically organized. The findings reveal that achievement goals are multidimensional in structure and that pupils in school pursue not only one type of goal at a time, but different types simultaneously. Analyzing the factors influencing the achievements of students in the subject of Islamic Studies in schools, as attitude and interest, Bin Che Noh *et al*.(2013) found that interested did not have significant relationship with the achievement of the students while the attitude factor has a significant relationship with the students' achievement in the subject of Islamic study.

Tiwari *et al*. (2014) analysed the relationship between academic motivation and school performance among students and they found that the medium of instruction was found significant on the two dimension of academic motivation scale namely academic belief and self regulated learning as well as school performance scale. Similarly, the interaction effects of the type of family and school were also found significant on the academic motivation and school performance. School performance was positively correlated with motivational belief and self regulated learning.

Regression analysis revealed that the motivational beliefs and self-regulated learning emerged as the best predictor of school performance. Jereb (2010) considers that study success can be influenced by following factors: social elements (social class position, parents' education, parents' profession, parents' income), student related factors (motivation, aptitude, effort, IQ, time spend on study, opportunity to learn, pre-university education), quality of instruction (organisation, course material, communication, assignments, exams, grading, course outcomes), curriculum (number of courses, sequence of courses, test schedule, system-block or parallel), government (grant, student

accommodation). He found that: the influence of these factors on study success is presented; social and academic integration are central aspects; "social elements" greatly influence the decision to enrol, but have less influence on marks received and the duration of study; grants also greatly influence study success and factors from the "quality of instruction" group can only explain 12.3% of the variance of exam results.

In order to measure students' motivation toward science learning, Tuana (2005), developed a questionnaire with six scales: self-efficacy, active learning strategies, science learning value, performance goal, achievement goal, and learning environment stimulation. He found a significant correlation of the students' motivation toward science learning with students' science attitudes and with the science achievement test. McInerney and Ali (2009) examined the multidimensional and hierarchical structure of achievement goal orientation measured by the Inventory of School Motivation (ISM) using eight specific dimensions: task, effort, competition, social power, affiliation, social concern, praise, and token. Their analyses suggest that there is considerable support for the multidimensional structure of achievement goals as represented in the items drawn from the ISM.

So, our study start from Amabile (1993) suggestion, the best way to help students bring maximum creative potential is to be allowed to do what they like. Thus, Ausubel and Robinson (1981) believes that there are three components of the concept of motivation in school:

1. The first component, **centred around the need to know and understand,** to master knowledge and formulate and solve problems giving rise to what is called cognitive impulse. Cognitive impulse is directed entirely to the teaching task in the sense that necessity to be involved in the task that is intrinsic to the task itself, i.e., is simply necessity to know.
2. The second component of motivation is a strong affirmation of **self and high school performance** can meet this need as achievements thus lead to primary or acquired social situation which generates feelings of acceptance student awareness and self-esteem.
3. A third component of the motivation of school work is based on **necessity of affiliation.** She did not return to education is oriented rather towards achieving that ensure individual approval by a person or group of people with which he identifies in the sense of dependence on them, and that if a declaration of, he acquires a social situation, or derived indirectly.

Golu (2001) and Afzal et al. (2010) examining the influence of student motivation on academic performance found a positive and mutually causal relationship between student's motivation and student's academic performance. This relationship is reciprocal which means students who are more motivated perform better and students who perform better become more motivated. More than that, they concluded that academic performance is positively influenced by intrinsic motivation and negatively affected by extrinsic motivation. Kusurkar *et al*. (2013) provided acceptable evidence that the quality of motivation is important in determining good performance among medical students through good study strategy and high effort.

They arrived to this conclusion using Structural Equation Modelling analysis technique in order to test a hypothesized model in which high *relative autonomous motivation* would positively affect *good study strategy and study effor*t, which in turn would positively affect academic performance.

Taking into account these studies, the aim of the paper is to quantify the influence of the media models presented in the mass-media as models of success in a new economical market and new orientation of job market.

The social models, the human activities and the global evolution generate the need for sustainable development in education. Studding the international initiatives that have emphasised that education is an imperative for societies to become more sustainable, Ramos *et al*. (2015) found that there have been many efforts in the implementation of sustainable development in higher education institutions, there are still many challenges to integrate sustainable development into their systems, and many opportunities for research in this topic: implementation of sustainable development, stakeholder engagement and participation, campus operations, sustainability reporting and assessment, organisational change management, and curriculum development.

They consider that the main steps that must be followed by the higher education for sustainable development discipline may be considered: exploring new and rethink theories, approaches, concepts, methods, and frameworks, as well as providing case studies and guidelines for practitioners.

Verhulst and Lambrechts (2015) already presented a conceptual model, which links human factors to the sustainable development integration process, applied in a specific case study of a Belgian university college. The results indicated that the conceptual model helps to get a profound understanding of human related barriers for integrating sustainable development in higher education, as well as to understand the underlying reasons for these barriers and linkages between them in different stages of the integration process.

Thus, we consider that a new model must to be proposed in order to define a way of connection with the present generation needs without compromising the ability of future generation in order to respond to the demands of society the European Union that is promoting a new educational model linked to the development of competencies in research work focused on university and which fields are attractive for today's generation and can satisfy also the market need. From this point of view sustainable competencies can be define as a complex of knowledge's, skills attitudes that can influence and model the future intellectuality the power engine of economy and society.

In the context of globalization it has been recognized that education sustainability can additionally increase cross institutional compatibility (Godemann et. al, 2014), provide evidence of accreditation bodies and improve ranking position research, educational and environmental indicators (Lukman et. al, 2010). The limits of the sustainability education are the lack of sector with specific development, time and resources for sustaining education and lack of common understanding of sustainable education. There are three types of organizational change, according to intervention in the change process – radical intervention, serendipitous change a continual and unpredictable process s of adaptation to changing conditions and planned change, which offer to educational system the advantages of some type of guidance, without being to constrictive (Adam, et.al, 2013). The respond to the actual society demands, it is given by the European Union which is promoting a new educational model linked to the development of competencies, in our case focused on university level training (The Bologna Declaration of 19 June 1999).

2. Research methodology

This study is structured in three parts, in the first part we performed a diagnose for high school students, in the second part we made a diagnose for students which are already involved in academic education using the same survey, in the third part of the research we presented a cross cultural model for education system (Vega Marcote et.al. 2015), created by using a parallel between two education systems from different countries, that is Romania and Albania. The research establishes and counts the differences of perception of education between two types of education systems, in Romania the classical style and in Albania which is already applying and developing the dual system education. The paper proposes that higher education institutions need to consider sustainability reporting as a dynamic tool to plan sustainability changes and not just a communication activity.

2.1. Research Methods

The research was designed with the propose of evaluating the effect of an experimental educational model based on the development of sustainable competencies as opposed to a traditional model and comparing the data with the effect of educational intervention in the new field of environmental education with direct impact as possible with a cross contamination model for education (Hargreaves, 2007), (Abrudan, 2012). Three instruments were used in the research process based on the study variable:

1. A survey containing 25 questions, focus on a specific topic items;
2. The data collecting were analyzed with the statistical package SPSS™ program (Statistical Package for Social Sciences) version 20;
3. LISREL8.7™ program to establish the connection between variables and measure the possible correction (Guide on line, 2015).

SPSS program helps to introduce all the information and survey results. To be able to establish a cross cultural model for education, a PRELIS^{TM} program was used as a application for manipulating data, transforming data, generating data, computing moment matrices, computing asymptotic covariance matrices, performing regression analyses, performing exploratory factor analyses, etc.

2.2. Case study

The number of participants in the research totalled 450 students from Baia Mare, Romania and 150 students from Durres and Tirana cities from Albania. They have different education level, involved in different activities, enrolled in academic education system or graduated different type of adult education.

This study's aim was to explore the relationship between sustainability and organizational change management for sustainable education. The study was targeted schools in urban and rural areas on a representative sample in the Maramures County Region, Romania for 280 students, and another target group of 170 from Baia Mare University and 150 from "Aleksander Moisiu" University Durres, Albania. The method of study was the questionnaire anonymously through its implementation by school psychologists applying classroom and 280 students were involved, 14 schools and 320 students from two universities.

Although Romania and Albania were both part of the communist bloc, between these two countries involved in the study there are some cultural and training differences, taking into account that Romania still apply the classical style and Albania already apply and develop the dual system education: in Albania higher education institutions ensure jobs for graduates, while Romanian universities ensure jobs, only occasionally, when come requests from business environment, but not covering the offer; more than that, Albanian higher education system provide internships in companies that will engage graduates while in Romanian system is not a rule, being possible to be met only as exception; the curricula in Albanian system is founded on developing practical skills and competencies for students while Romanian system is still is focused on the theoretical training; in Albanian system the fluency in English and German is compulsory for graduates while Romanian system doesn't guarantee this level of knowledge of foreign languages, although the curricula contain foreign languages in the first two years of study; the Albanian system prepares students to be able to adapt to any situation that can be met in practice, in business environment, while Romanian system ensure this preparation only occasionally and for a small number of students, by special programmes of students mobility, that offered the students the possibility to gain practical competences in different institutions from abroad. By these programmes, Romanian system could prepare the graduates for success on labour European market.

2.3 Survey structure

The questionnaire aims school motivation. Because we want to know to what extent the students are motivated to study, the questions given needs a single variant of answer or multiple choices. The questionnaire was structured in more parts: identifying the demographic details, age, gender, parents education level, identify students motivation on learning, if they choose a model from mass media promotion and if the learning process influence their decision for future development.

Each part shows an education analysis of the respondents and also the level of quality of education perceived.

- **Part 1**. Identify the characteristics of respondents which are involved in economical activities age, gender, social status;
- **Part 2**. Collecting some information about the education level of respondents and also how family influences his education perception for a successful life. Mother and father level of education are identified to be able to determine the connection between variable factors;
- **Part 3**. To determine the education perception and the influence of education upon the respondents orientation;

- **Part 4**. Establish if education is in direct relation with the vocational orientation, identify which type of models influence the young generation if mass media has an big impact the model;
- **Part 5**. The connection between the education wishes and their vision about education in function of importance of specific fields of education in their life;
- **Part 6**. Identify the typology of factors socio-economical which influence the education selection. For a realist data for some questions some instruments were used in the research process based on variables:

- A scale of environment attitudes build and validated by Cronbach's alpha coefficient;
- A scale for intention of behaviour with propose of analyzing the impact of education upon the respondents;
- A Likert scale from 1 to 10 to evaluate the impact of education for respondents (Allen et. al, 2007).

3. Results

The population distribution by gender is 57% female and 43% male. For our target the distribution in function of students' residence 47% comes from rural areas and 53% in urban areas. Students interviewed were aged between 10 years and 18 years, the lowest percentage of 1% percent for 10 years old, for students of 14 years we have the largest percentage of 21%.
This percentage can be explained by the fact that students of 14 years are graduating the secondary school and they have to take a decision about their future orientation and followed high school in different education profile.
The study takes also in consideration the factors that can influence the students decision regarding his/ her future.
The Mother's education level from data analysed show us that a share of 56% of students studied have mothers that in average finished high school, 24% of mothers graduate academic studies and 20% had mothers who completed 8 grades, the primary school. Analyzing the father's education of students studied it can be seen that most students have fathers with a level of basic study high school, 12 classes in the percentage of 59%, a percentage of 24% of fathers have higher education, 14% have completed 8th grade primary school and a percentage 1% of students did not know their fathers studies and 2% said they did not have father.
Another part of the survey was to identify the students' desire for success in their life. For item "To what extent do you want to have a successful life ?" students responded in 62% they want very much to have a successful life, 36% answered largely, and one percent responded limited extent and small extent. For the Part 3 the meaning of success for students has the following option: 1. Should have money; 2. Should have a job / to practice what you love; 3. Should be appreciated at work and / or family; 4. Should have social relationships; 5. To have many friends / be popular and 6. I don't know / No answer.
A percentage of 58% of the students associated success with job / to practice what you love. 22% of students associated with assessing success at work and 13% have associated success with money. For possible answers to have many friends / be popular and have social relationships were recorded 4 percent and respectively 1% percent.
Although at times we face the lack of motivation of students for learning, school in general, however, students believe that school is important to them. A percentage of 53% of students said that school is important to them and 44% said even that is very important. Only 3% responded that the school is not at all important.
Majority of respondents 97% consider the education a very important factor for their future for their successful life. Taking into consideration the influence of mass media, the connection to internet, IT, mobile phone, and another part of the survey is trying to identify how much the students like to learn.
The results show that students are actually happy to learn. 59% of students responded that they love to teach largely, 8% said they like to learn even heavily, 27% responded that they like little to learn, and by 3 % percent said they like a very small extent and not to learn. Students believe that a thorough training will help them achieve success in life.

Thus, 48% of students believe that thorough preparation helps them achieve success largely a percentage almost as big of students believes that thorough preparation helps very much to achieve success, 9% think that helps them to a small extent, and one percent responded that thorough preparation helps very little or no reach success.

3.1. Motivation for study

Looking at the chart we can see that small values of the scale showed lower rates and higher values of the scale have higher values. As the scale values grows, grow and percentages from 1 to 10. The highest percentage recorded for the value 8 scale with a percentage of 30% and a value of 1, 2, 3 scale recording a rate of 1%. From the middle of the scale values increase. The five value scale has been a variable of 9%, 6 scale value registered a 10% to 7 scale value registered a 16%. The highest percentage recorded for the value 8 of the scale, 30%, 20% recorded in September of the scale value and the value 10 has been a 10% share.

3.2. Factors that stimulate learning

Analyzing the factors that stimulate learning, the factor which has recorded the highest percentage is the desire to practice in a particular area of 23%. Another factor which students give great importance is encouraging parents/ teachers of 14%. A percentage of 13% of the students mentioned the desire for knowledge, a rate of 12% considered an important factor in stimulating learning assessment parents / teachers, and one mentioned a 10% success rate and success of parental figures taken as a model. Smaller percentages were recorded for teacher quality of 5%; 4% for success friends and attractive curriculum around 4% percent.

3.3 Influence of life stories of successful people

Asking students what extent the success stories of people motivate them to be successful in life, 45% of students responded largely, 21% heavily, and 26% small extent, 5% very little, and 3% at all. Students are very optimistic about the possibility of reaching the success. In 56% of students responded that they can successfully reach heavily, 39% of student's responded version largely, little 4% and 1% to a very small extent.

3.4. Factors that reduce school motivation

The factors mentioned by the students, which led to decreased motivation to learn are presented in Table 1. The statistical results present that 25% from students are negative influenced because of some events from unsuccessful learning marks or failed examination. 24% of respondents have negative attitude in front of education because of emigration trend influence of the very well paid jobs abroad, the separation from family and strictly rules from schools, the spirit of freedom and for that reason they abandon the school and they don't need education.

Table 1. Principal factors identified that influence the learning motivation process

Factors of decreasing motivation to learn	%
Previous failures in learning	25
Negative attitude towards school in general	24
Lack of appreciation from parents / teachers	14
Lack of encouragement from parents / teachers	13
Lack of successful models	7
Undecided	17

3.5. How does residence school can be a factor of influence of education

Analyzing school motivation in terms of the residence, it can be seen that students in urban schools are slightly more motivated than those in rural areas. It is interesting to note that students in both areas of residence are on the scale at a value of 8 (Figure 1).

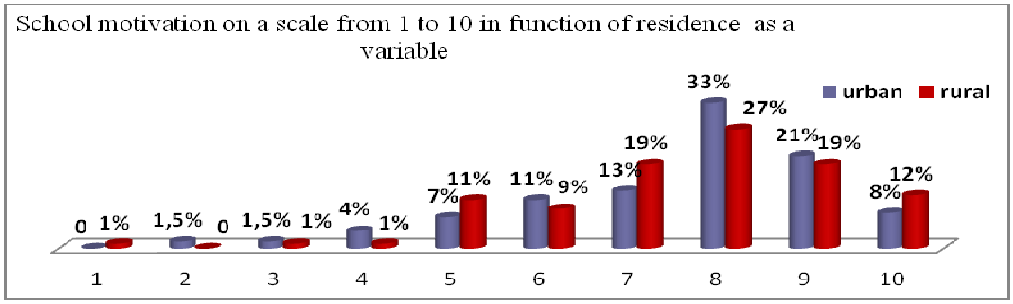

Fig.1. The influence of residence on school motivation

Analyzing school motivation based by gender there are apparent similarity values obtained from the association made between school motivation and variable scale on the area (Figure 2).

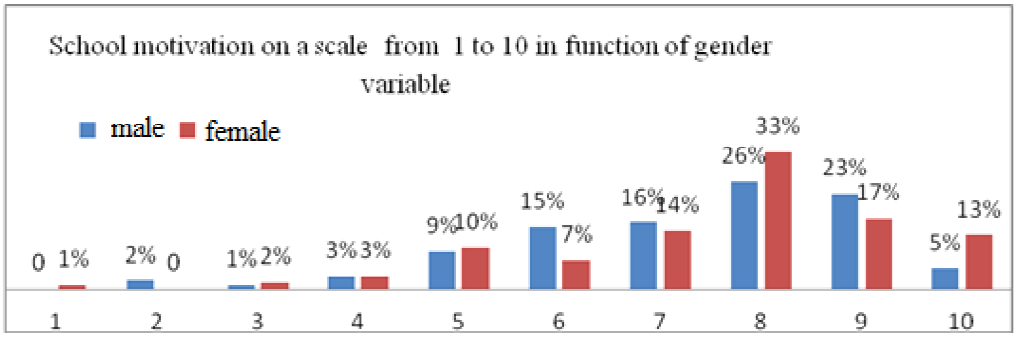

Fig. 2. Motivation of education process in function of gender

Motivation was analysed on a scale from 1-10. Value 8 scale recorded the highest percentage from both, the boys and girls, 26% boys and 33% girls. There were higher percentages of boys 6 values (15% of boys and 7% of girls), 7 (16% boys and 14% girls) and 9 (23% boys and 17% girls).

3.6. An Analyze of education in academic circle

The results show significant differences in the knowledge and students orientation attitudes and intention of the behaviour of the aspiring for an academic preparation. This first analysis shows that the dual system education model promotes and favours sustainable actions in higher education. The dual system it is responsible for basic training more efficiently and could be the basis for future proposals in this field. The study presents radiography from Albanian education system, with impact to a educational model and the sustainable orientation for a global educational model. Analyzing the data from research work focused on the importance of education, we found that for 104 Albanians person education it is very important, that's mean that 69.3 % consider education an important factor for their evolution in life and professional career (Table 2).

Table 2. Education impact on success in career

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	yes	104	69.3	69.3	69.3
	no	46	30.7	30.7	100.0
	Total	150	100.0	100.0	

Taking in consideration the importance of a model in education students life, we can observe that from the 150 Albanians persons, a number of 28 persons are influenced by their parents and families relatives stories success, 23 persons answer that their model are famous business man, 16 persons are influenced in their educational and future orientation by politicians and only 9 persons are guided and by their teachers model. 72 Albanians respondents consider that there were not influences by any model or received suggestion in their professional and educational evolution.

The impact of education and her importance for each respondent's, present a stabile situation. People were giving a mark from 1 to 10 to education in function of importance in their evolution life, 63 respondents consider education very important, 25 people important and 38 persons give to education a score between 8-7. In balance on the Romanians' students, 87 persons answered that they haven't a model in their successful carrier. Another part of survey present a very interesting orientation of young generation, for example they have mention other models like celebrities from sport, actors but nobody mention or suggest persons from mass media, TV , moderators or famous newspaper redactors. That's mean that mass media and her products, even the impact of television it is very aggressive don't have such a big impact in respondents education orientation and majority of theme choose and followed as models typology. We can mention that for 6% from respondents, teachers remain models in the future orientation in student carrier life, and computer invasion can't replace or influence the future orientation of "face book" generation. Only 36% from respondents don't have any model which influences their educational evolution (Table 3).

Table 3. Models that influence education in Romania

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	other family relatives	15	6.3	8.8	8.8
	businessman	1	.4	.6	9.4
	politician	12	5.0	7.1	16.5
	teacher	54	22.5	31.8	48.2
	other mass media, actor, sport	1	.4	.6	48.8
	no	87	36.3	51.2	100.0
	Total	170	70.8	100.0	
Total		170	100.0		

For Romanian students we can observe the differences, maybe the conservator style in education, put accent on teacher influence as a model for future of young generation for majority of educated people 22.5% and family successful carrier 6.3%. The survey present also the results regarding the orientation and education vision of Albanian respondents. The majority of 22.7 % from young generation consider IT field an important education field for future development in a global management and technological evolution.

IT in respondents vision it is important if we take in consideration the new trend on market the e-generation: e-commerce, e-banking, it is normal and necessary to define and adapt an e-education model. The young generation it is orientated also on economic education with impact in future activities taking in consideration the Albanian transition market to capitalist, to small and medium business and the regeneration of new manufacture under the high tech technology. The engineering education also it is considered as a successful field because as we know the power of economy it is production. 19.3% are oriented to engineering including here mechanical, electrical which present a practical generation. 17% are oriented to economic fields, management and business administration to develop their own business for a free activity or production. As a result the law, languages fields are not successful taking in consideration the free spirit of young generation and the boom evolution of technology. The next analyze was taking in consideration the situation of respondents in which

education it is evaluate between wishes and respondents vision, different activities in which they are involved in function of aptitude, skills, knowledge and education level, in function of different field of universities profile and also to clarify which field it is consider to be successful.

In Table 4, Romanian students present their vision about and for future sustainable education field. Majority of 25% consider economical field very important for future and also IT as a fast and quickly solution for communication and maybe for a future e–education method and technology in educational systems.

Table 4. Education vision for Romanian students

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	economics	59	24.6	34.7	34.7
	law	6	2.5	3.5	38.2
	IT	40	16.7	23.5	61.8
	medicine	35	14.6	20.6	82.4
	engineering	24	10.0	14.1	96.5
	languages	4	1.7	2.4	98.8
	other	2	.8	1.2	100.0
	Total	170	70.8	100.0	
Total		170	100.0		

Albanian respondents already involved in an educational field consider that economic and medicine educational fields are important, also we consider that it is important to mention that engineers' wishes, for example, are to complete their knowledge's with economics notions.
The fields are different, on top it is economic education with 26.4%, medicine 18.2% followed in immediate values with 16.9% and 16.2 % by law and IT.
As we can see the IT and economic education are again in top of preferences of respondents taking in consideration that IT field and the new wave of technology invaded the daily life and give a new opportunity to a new Global Etiquette model in education.
This global etiquette is the new vision when doing business with other countries, modern technology is organization and people best friend. Technologies such as e-mail, Face-book, Twitter and Skype make it much easier to conduct international business with just a computer with an Internet connection.
The Internet makes it much easier to build a network of contacts quickly, and can help people start to establish a presence in the different country. Touching base and communicate with a local person can help people to understand the current market conditions in the country, the demand for organization product or services, as well as the business culture.

Table 5. Education importance in Romania

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	economics	63	26.3	37.1	37.1
	law	2	.8	1.2	38.2
	IT	51	21.3	30.0	68.2
	medicine	23	9.6	13.5	81.8
	engineering	24	10.0	14.1	95.9
	languages	6	2.5	3.5	99.4
	other	1	.4	.6	100.0
	Total	170	70.8	100.0	
Total		170	100.0		

Using informatics programs it was possible to establish and create a connection between the importance of education and the respondent's desire.

Education impact in function of importance for Romanian students, is 37% for economical education to increase the national market to a global provocation and 30% for IT.
The other field like medicine and engineering are on equal vision as importance from their point of view. In conclusion family also has a big impact in respondent's orientation and creates a balance between parents education level, mother and father influence is divided in a positive way.

3.7. Propose of A Cross Educational Model

Because the topic of paper it was to identify a cross model in education it was necessary to create cluster taking in consideration the variables and factors which influence the educational process.

For Romanian students the cluster grouping it is concentrated around the cluster 2 with 122 persons and 21 persons to cluster 4 and 20 to cluster 1.
We can observe that cluster 2 is focused on model influence in their education period with big impact in their future decision, teacher, family relatives and their successful story. For cluster 4 in comparison the cluster shows that students establish a vision for their future and decide that education is very important for their successful career.
Family also has a big impact for student profile and cumulates everything, it is important as individual culture education: family, mother and father education level, importance of education for each person as individual (Table 6).

- **Cluster 1-Education vision**- Education impact in success of career, Parents influence in education decision, Financial and social status
- **Cluster 2-Education wishes**- Education models. Models that influence education decision, Father education, mother education
- **Cluster 3-Education perception**- Education importance
- **Cluster 4-Education Culture environment**- Future vision.

For Albanian students taking in consideration the cluster grouping we can observe that from the 150 persons, a number of 52 persons belong to cluster 1, and 50 persons to cluster 4.
In function of age, level of education of respondents, family level of education mother and father, the influence of family for the future vision of people orientation and education wishes and education vision of person involved in different type of activities it was possible to define four type of cluster and harmonize the factors in four types of factors of influence upon the sustainable education model proposed by Boca, et.al (2015), (Table 7).

- **Cluster 1-Education vision**- Education impact in success of career, Parents influence in education decision;
- **Cluster 2-Education wishes**- Models which influence education decision, Father education, Mother education;
- **Cluster 3-Education importance**- Social status, Financial stability, Family appreciation, Education level of respondents;
- **Cluster 4-Education social environment**- A good job position, Supervisor/ boss/ chief appreciation, Colleagues appreciation.

Table 6. Cluster for Romania

Number of Cases in each Cluster Romania

Cluster	1	20.000
	2	122.000
	3	7.000
	4	21.000
Valid		170.000

Education importance	3
Future vision	4

Table 7. Cluster for Albania

Number of Cases in each Cluster Albania

Cluster	1	52.000
	2	21.000
	3	18.000
	4	50.000
Valid		141.000
Missing		9.000

Cluster in Albania

Case Clusters	4
Education vision	1
Education wishes	2
Social status	3
Models who influence education decision	2
Education impact in success of career	1
A good job position	4
Financial stability	3
Supervisor/boss/chief appreciation	4
Colleagues appreciation	4
Family appreciation	3
Education of respondents	3
Father education	2
Mother education	2
Parents influence in education decision	1
Parents obliged respondents in education decision	1

Using the principal components analysis as a tool to realize the educational model we can identify that the connection between mother and father influence upon education respondents decision with a balance values for example for Albanians between 0.64 for father influence and 0.61 for mother influence (Figure 3).

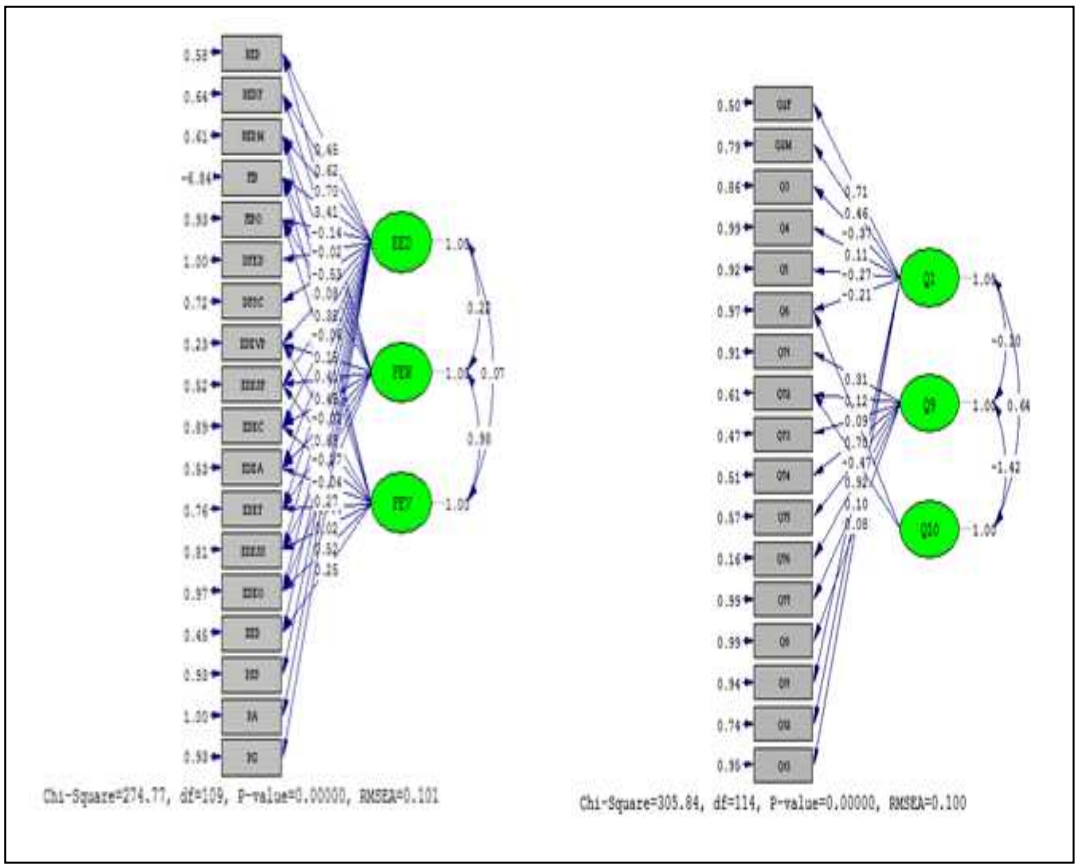

Fig.3. The principal components analysis of educational model

In conclusion, creating the clusters for educational perception and cultural model we can identify that we have an individual culture, a social culture and an environment culture which gives identity for each country but with the same final results.

Also family has an important role in student's life from the first stage of high school until academic environment, the mother and father are the first persons who can influence the individual culture.

From the data analysis only a low number of respondents confirm that the parents obliged there in education decision, the majority of respondents from both countries take their own decision in the education field that they followed. To create the cross cultural model for education it was necessary to establish some important factors like: the individual education EED –for Albania and Q1 –for Romania, the future vision of education FEV –for Albania and Q9 –for Romania and FEW -future wishes for education for Albania and Q10 for Romania. In function of those three factors the model presented in Figure 3, presents the strong relations between the individual culture and future vision and wishes regarding the education with strictly relation with the environment as a management culture of society.

The results denote that all items loading are statistically significant and the magnitude for most variables and their indicators are above reasonable benchmark. In relation to the score for the correlations, the score indicate the correlations are between the ranges and results can take in consideration as good model.

4. Conclusions

Results are significant and show that students genders, their families and particularly the parents education levels were significant factors in determining difference in the future orientation and development of students' sensitiveness and behaviour.

The results also show that the inclination towards a field or another is similar among the girls and boys. By applying the modelling method, the influence between the family involvements in educational activity, motivational states and the student's integration in the social, economic and global environment were validated.
In order to increase the education sustainability it is recommended to improve and create the base for a future education model.
The result of the study reveals certain trends in the students' population:

1. Influence of TV characters is not as great as previously believed, and students are aware of the need to mobilize to learn.
2. Preparation for future employment is a priority for children and adult, they are aware of the future.
3. There are enough motivational factors, both at school and in the family for children and students to learn more.
4. Unmotivated factors are only declarative and induce false idea that students are influenced by factors which are not distracting them from the study.
5. There is a huge difference between the actual results obtained in examinations and statements that lead students to the conclusion that there is good to learn and study, but the implementation of the desire to learn is reduced either because of lack of learning methods and factors that can motivate student.

Culture Model for managers from education system, in their sustainable vision for education can be a thematic reflection with a portfolio of solutions given by the article and for the educational organization management as well in other words culture is as well decision and execution.

4.1. Expected changes

The education organizational culture has exploded with a big impact in management, in that situation we can take in consideration the cross cultural management as a system with hard and soft aspects. The organization has its hard aspects including here knowledge, management and institutional support Expected changes are presented in the Table 8.

Table 8. A Cross Cultural Education Model

Albania			**Romania**	
C1	Education vision Education impact in success of career Parents influence in education decision Parents obliged respondents in education decision	**External influence**	Education level How important is education Family appreciation Education impact	**Education Culture individual**
C2	Education wishes Models who influence education decision	**Model influence**	Father education Mother education	**Family Culture influence**
C3	Social status Financial stability Family appreciation Education of respondents	**Social influence**	Financial stability A good job position Supervisor / boss/ chief appreciation Social status	**Social impact**
C4	A good job position Supervisor/ boss/ chief appreciation Colleagues	**Model appreciation**	Future vision Education importance	**Future vision**

	appreciation			
C5	Model that influence education Colleagues appreciation			**Management** **Culture** **Environment**

If we take in consideration the education organization like a human universe which include here the specific behaviour and colourful environment of individual culture and as a multi cultural team, in that situation if we maintain the analogy with the cluster image might be assimilated to the soft of model (Table 9).

The evaluation of the cross-educational model seems to indicate its highly effective resource for environmental education focused on sustainability, and favours the development of knowledge, attitudes and future intentions of inspiring educational environment.

In Romania, the professors, family and friends still have an important influence on students' motivation and performance in education while in Albania the motivation is focused on the good job position, appreciation of colleagues, friends, boss, family and financial stability. Some universities from Romania tried a cross cultural education by opening cross border branches in economics and engineering in Republic of Moldova in order to prepare students for the Romanian and/or European labour market.

Table 9. A Cross Cultural Model in Education

Romania	**Albania**
Parents success	A good job position
Friends success	Financial stability
A successful person as model	Colleagues appreciation
Teachers Model qualities	Supervisor/ boss/ chief appreciations
Encourage by parents and teachers	Family appreciation
Parents and teachers appreciation	Social status
Attractive school curricula	Other

Therefore it is very recommendable for the Albanian education system to act related to environmental education, to work on the development of sustainable competencies despite the research problems identified, and also to deal with the future scenarios or perspective.

In short, this research shows that an educational model on the development of sustainable competencies is very useful through the different periods of education systems and gives the possibility to identify the opportunities and traits from each education organization.

The paper of educational model proposes some factors impeding the changes in education institutions and also institutions need to consider the sustainability reporting as a dynamic tool to plan sustainability education changes and not just as a communication activity. In the context of higher education it has been recognized that cross institutional comparability improves the education perception, especially in a flexible education system.

The past should be a motivator for education and not a museum presentation. Sustainable education improvement and change connect the future to the past and create a social vision about where society has been and where it is headed. The model can be useful on passing of knowledge from one generation to the next generation, managing succession and distributing the competencies and responsibilities to a repetitive change.

The humanistic and creative pedagogies in school where every child matters, a new educational model can be a support of trust systems and offer some of the most promising ways forward. It is time for other more sustainable sensibilities to take their place and the climate is certainly ready for

it. Sustainable educational development respects, protects, preserves and renews all the values in the past and learns from it in order to build a better future.

Abstract

This study presents e-learning analysis in Saudi Electronic University (SEU). The study investigate that SEU that apply the concept of blended learning, which relies entirely on ICT as a means of learning and education are aligned with the National Plan for Communications and Information Technology ICT. This study focuses on the 4th objective in the plan, that how much SEU uses e-learning in teaching, learning and in the academic research. The results show that Saudi Electronic University e-learning use is aligned with the Saudi National Plan for Communications and Information Technology.

Keywords: eLearning, ICT, Saudi Electronic University

1. Introduction

The role of Ministry of commination and Information Technology (MCIT) is one of the pioneers in the development eLearning in Saudi Arabia. MCIT focus on granting infrastructure and work on development and investment in the ICT sector. The MCIT set up a comprehensive plan focuses on a broader unification of the state process through the establishment of the National Communication and Information Plan (NCITP), which contribute to the improvement and development of the ICT in all Saudi government sectors of the state, educational and civil. The focus is on the fourth goal of the plan, which focus its attention on how to deploy and take advantage of education through effective communications and information technology in the field of teaching and learning on a broader level. In particular, Project P-4-17-70: Dissemination of ICT in Educational Institutions.

For these reasons, Saudi Electronic University has been founded to apply the Project P-4-17-70: Dissemination of ICT in Educational Institutions that mention in 4th objective projects. This research in progress study will investigate that is the use of ICT in Saudi electronic university is aligned with the National Plan for Communications and Information Technology?

1.1 Aim and Objectives

The aim of this study is to presents e-learning analysis in Saudi Electronic University. Following the main aim, the objectives are as follows.

- To address the active role of ICT in the Saudi Electronic University.
- The address role of MCIT in the Saudi Electronic University
- The address the concept of blended learning, which relies entirely on ICT as a means of learning and education in the Saudi Electronic University.
- To presents the results if aligned with the Saudi National Plan for Communications and Information Technology

The following section presents literature review. Then the linking of SEU to NICTP is presented. Then the methodology is presented. Finally, the study is concluded and some limitations are presented.

2. Literature review

Few studies have shown the use of Information and Communications Technology ICT in education in Saudi Arabia. This literature review discusses Information and Communication Technology (ICT) in Saudi Arabia, then Ministry of commination and Information Technology (MCIT), which has adopted National Communication and Information Plan (NCITP). In particular, the 4th objective of the plan about ICT disseminate in education. The Saudi Electronic University (SEU) is selected as case study to disseminate ICT in education.

2.1 Information and Communications Technology (ICT) in Saudi Arabia

The use of ICT is an omnipresent reality in our daily lives. The impact of ICT on the social well-being of a community is a more ground-breaking topic, one that is outside regulators' traditional comfort zone, but is now clearly emerging as an area of significant interest. Saudi Arabia, like many countries, is witnessing the socio-economic impact of the ICT revolution. This revolution has happened because of the rapid development of ICT infrastructure and usage in the Kingdom. Domestic broadband penetration has increased from nothing in 2005 to more than 44% today, while mobile penetration increased from 60% to 191% over the same period (Waverman, 2011).

2.2 Ministry of communication and Information Technology (MCIT):

A royal decree No. A/2 was issued on 28/2/1424 H.(1/5/2003) changing the name of the Ministry of Posts, Telegraphs and Telephones (MoPTT) to " the Ministry of Communications and Information Technology". This change reflects the attention given by the Saudi government to the communications and information technology sector. The change also aims at the realization of the ambitious goals for the transfer to information society (MCIT).

2.3 National Communication and Information Technology Plan (NCITP)

Kingdome of Saudi Arabia represented by Ministry of Communication and Information Technology has set a vision to improve the ICT skills in all spectrum of society and enhance productivity in order to lead the country transforming to digital economy and informatics society. To achieve its vision, MCIT put a plan contain seven general goals:

The seven General Goals of the NCITP (Saudi Electronic University, 2011)

The Seven General Goals of theNCITP		
	Target	Scope
1	First goal aims at raising the productivity of all sectors, dissemination of governmental, commercial.	Services and Productivity
2	Second goal seeks to regulate the ICT sector in a form that guarantees impartiality, stimulation and attracts investments.	ICT Sector Regulation
3	Third goal aims to build a solid ICT industry that is capable of competing locally and internationally and become a major source of income.	ICT Industry
4	Fourth goal seeks to secure the best possible utilization of ICT in education and training at all levels.	Education and Training
5	Fifth goal seeks to enable all sectors of the society, in all areas of the country to deal with ICT easily and efficiently in order to bridge the digital divide.	Digital Divide.
6	Six goal aims to provide best utilization of ICT in serving the Arabic language and consolidating the civilizational mission of Islam.	Islam & National Identity and Arabic Language
7	Seventh goal aims to provide qualified and trained, male and female human resources in the various ICT specializations through the preparation of national manpower as well as attracting international expertise.	Human Capacity
Source: 2012 Annual report of NCTIP		

The availability of proper infrastructures is vital for the dissemination of ICT systems. This project aims to achieve the following (The National Communications and Information Technology):

- Connect all educational institutions to the Internet.
- Dissemination of management and financial information systems in educational institutions.
- Provide e-mail services for all students and employees in all educational institutes.
- Dissemination of well-equipped electronic classes in all schools and universities.
- Equip classes with multimedia and video facilities.

3. Analysis

3.1 Saudi Electronic University (SEU) and foundation

The Saudi E-University is a government university that represents one of the modalities of higher education. The SEU is the only specialized university in distance education in the Kingdom of Saudi Arabia that offers both graduate and undergraduate degree programs along with life-long education environment based on information and communications technology, e-learning, and distance education (Saudi Electronic University, 2011).

3.2 SEU disseminate ICT in education

SEU has deployed many electronic services that reflecting their aiming goal such as:

- Smart boards in the classroom
- Computer labs
- University Forum
- Saudi Digital Library (SDL)
- English First (EF)
- Blackboard (BB)
- Student services

- Student Banner System
- E-mails

3.2.1 Smart boards in the classroom

Provides Flexibility with different forms of media – including photos, illustrations, maps, graphs, games, and video, to be displayed with many applications for the participation of the amendment by the opportunity for students to discuss to Write a review in the classroom. By Access to online information with teaching tools to show the possibility of learning aids such as display videos, review recorded lectures, scientific experiments to enhance the learning process to try to enrich the knowledge.

3.2.2 Computer labs

Computer labs are equipped so that the student and faculty member utilized in the process of education and the transfer of scientific information through experiments and the application to gain knowledge through practice process. The availability of computer labs produced the latest technical devices and pieces of physical education programs needed by both the student and faculty member, where it is characterized by availability in the study environment.

3.2.3 University Forum

University forum is an area of academic communication and exchange of experiences to study and share ideas and opinions that will improve client education and take advantage of sources and references. The forum is mainly equipped to service the student, enables you to counseling and seek help from an expert or a faculty member that these Forums representing the university officially.

3.2.4 Saudi Digital Library (SDL)

Saudi Digital Library (SDL), is the largest academic source of information in the Arab world, with more than (310،000) scientific reference, covering all academic disciplines (Saudi Digital Library, 2012). One of the remarkable features provided by SEU in order to enhance the education in the Kingdome, SDL have been connected with SEU website where it is going to help & serve university students and faculty by providing simply access to the huge usefully resources from worldwide between their hands.

3.2.5 English First (EF)

EF considered a global pathfinder programs to learn English as a second language. As a progressive step SEU employed an EF since established by the deanship of Preparatory year, EF allow students to log into the website by their own account to improve their ability in English language. A multiple activities are available in the website and collaborative learning tools to interact virtually with their English language instructors that help students participating and practicing effectively (Saudi Electronic University, 2012)

3.2.6 Blackboard

Saudi Electronic University (SEU) uses blackboard for eLearning system. Because of its ease of access, university Management preferred Blackboard solutions over and compared to competing vendors. Blackboard system is a Learning information management system, follow-up of students and monitoring the efficiency of the educational process in the educational institution (Subject-Based System). The system allows great opportunities for students to communicate with the course outside the class, anywhere and at any time through this electronic system which provides a variety of tools to view the content, scientific material for the courses and interact with them in an easy ways, as well as communicate with the instructor and other students enrolled in the same course with a variety of electronic means. It consists of tools and methods, which allows faculty members to build dynamic and interactive courses very easily with this content management courses in a flexible way, to do everyday tasks of the educational process effectively. In addition the system offers virtual communication at any time and at any place (Saudi Electronic University, 2012).

The system allows instructor to build integrated electronic courses, put notes, outline of the content, tasks, and announcements. Also it can view mid-terms exams, final exams and results. The system allows direct communication with students through the windows of dialogue and targeted e-mails and generalized. It could be linked with other e-learning systems and allows students and instructor to interact with these systems and in an integrated manner (Saudi Electronic University, 2012). The simplicity of the system encouraged global universities to employ blackboard system and in return SEU utilize it in order to connect their blackboard system with Colorado state University system (Partners Blackboard, 2012).

3.2.7 Student services

Facilitated "Saudi electronic university" a student services for their students who wish to request educational services without the need for physical communication and attendance in person to the university building, of course, it provides the students, faculty and employees of the university members to benefit from the services provided at the main university site, Student services sufficient to meet the students' academic and service requests. List of Student Services contain

- Status of academic
- Course schedule
- Reload communicate data
- The certificate
- A certificate of attendance tests
- Order English equation
- Educational systems
- Technical support and FAQ
- Request the withdrawal of the university
- Aviation reduction request
- Order university card
- Presence identification tests
- Make excuses
- Your progress in the EF school
- Submit an objection to the result of the final test
- Academic calendar
- Asked reset password mailed
- Transcript OF academic record
- Request a medical report
- Courses schedule
- Change Request Specialization
- Demand equation courses

- Request for registration
- Testimony tuition fees
- Request the withdrawal of the decision
- Study Plans
- Apology for the study
- The postponement of the study
- Changing study branch
- Recording the decisions of the preparatory year system
- Apologies for the study in the summer semester

3.2.8 Student Banner System

The BANNER Student Information System has option of student registrations, records and accounts to reflect his academic processes. The students can login to the Banner from the main SEU webpage.

3.2.9 E-mails

SEU used Outlook Office 365 as an official emails system by assigning each student his own email account upon the student's matriculation to the institution. It is uncharged and remain is active as long as the student stay as an active member. In addition to email service, the Outlook Office 365 includes task management, calendar application, and contacts manager.

3.2 SEU contribution to the 4th objective in NCITP

When look at e-services that mention in details in 2.3.1 section, it is obvious that SEU created a strong electronic learning environment.

These e-services:

- SMART boards in the classroom
- Computer labs
- University Forum
- Saudi Digital Library (SDL)
- English First (EF)
- Blackboard (BB)
- Student services
- Student Banner System
- E-mails

The above services have been deployed by SEU, which adopt 4th objective in NCITP (Project P-4-17-70). Project P-4-17-70: Dissemination of ICT in Educational Institutions (The National Communications and Information Technology, 2005)

- Connect all educational institutions to the Internet.
- Dissemination of management and financial information systems in educational institutions.
- Provide e-mail services for all students and employees in all educational institutes.
- Dissemination of well-equipped electronic classes in all schools and universities.
- Equip classes with multimedia and video facilities.

4. Conclusion and Future work

The aim behind this research is to study the contribution of SEU on case of MCIT national plan. Although the research has reached its object, there were some unavoidable limitations. First, due to time limitation as this research was conduct during the mess of last year prior graduating. The other

limitation is Lack of reality example of NP. However, the researcher hopes that this paper provide readers some valuable information about the considered subject area.
In future work this study intends to apply a qualitative approach to reach the aim and objective of this study. In particular, face-to-face interviews will be conducted to collect qualitative data. The population of this study will be employed at MCIT and SEU. The sample consists of employees and senior staff who are the users of eLearning technologies at SEU and policy makers from MCIT side. Open-ended questionnaire will be used for interviews. Questionnaire will consist of questions related to eLearning services in SEU. The qualitative data collected will be then analyzed using Nvivo software.

Utilization of Controlling and Other Methods on Base of Pdca Model

Ing. Lukáš Kruml, University of Pardubice, Faculty of Economics and Administration, Studentská 84, 532 10 Pardubice, Czech Republic, E-mail: Lukas.Kruml.cz@gmail.com
doc. Ing. et Ing. Renáta Myšková, Ph.D., University of Pardubice, Faculty of Economics and Administration, Studentská 84, 532 10 Pardubice, Czech Republic, E-mail: Renata.Myskova@upce.cz

Abstract

The paper deals with controlling as one of the most important tools (approaches) of corporate management based on continuous improving. It lays out possibilities for its interconnection with other management tools. Possible relations between controlling and other management tools are examined and described. Their interconnection with the controlling system of a firm multiples its assets in terms of the synergy effect and increases the efficiency of management, creation of innovations and productivity of the entire organization. For these purposes graphic model is created that represents these basic relations and expresses also the principle of continuous improvement, which is considered to be the point of entire controlling.

Keywords: controlling, continuous improvement, relationships

Introduction and methodology

Today's very chaotic time places great demands on management system of all firms and the management is a very complex and demanding process. It is controlling that belongs to the most popular of such tools, and as far as the knowledge economy is concerned knowledge and process management are becoming more and more widespread. An essential question is what tools and methods the managements of organisations should use so that these aspects may, in mutual cooperation and fully utilised, maximally streamline management as well as continuous improving.

The objective of this work is to increase the practical value of controlling in relation to selected management tools supporting continuous improvement on base of PDCA model.

Based on a literature review and analysis of theoretical foundations is described relationship between controlling system and model of Deming's PDCA cycle. Interconnection of controlling and other management tools in context of continuous improvement is examined. After that, operative controlling is presented in form of a graphic model for the purposes of identification and analysis of contributions of interconnecting controlling and selected management methods supporting continuous improving.

1 The current status of knowledge

1.1 Controlling as a philosophy of management

Freiberg (1999) says that controlling represents a specific concept of the corporate management based on complex information and organisation links of the planning and control process. This means that controlling is not just checking – it is a certain attitude to the management system, a way of economic management of a company that focuses on future. Some even speak of a certain managerial philosophy based on management by exceptions. Eschenbach (2004) sees the basic difference between checking and controlling in the value added that is generated by evaluations and proposals of corrective changes, i.e. remedial and preventive measures, to eliminate deviations and achieve or modify a planned objective for future.

The most important tasks include planning, budgeting, calculation, common and special analyses, identification and evaluation of deviations, creation of informative reports, administration, etc. (Mikovcová, 2007) Operative controlling focuses on a short period of time. Reality (i.e. really achieved results) is continuously compared with plans, deviations and exceptions are identified and measures are proposed to secure the meeting of operative goals, which contributes to the fulfilment of the strategy. (Becker, 2011)

1.2 PDCA model

This model contains four stages - Plan, Do, Check, Act. Often represented as the four quadrants of the rim of a circle to reflect the fact that once all four elements have been accomplished, the cycle repeats. Generally, Plan stage involves analysing the current situation, gathering data and developing ways to make improvements. In the Do stage, plans are implemented according to planned ways and methods. The Check stage requires determining whether the all (processes) is working as planned or whether any revisions are needed. In Act stage, measures are proposed against existing deviations between plans and real results and improvements are implemented to practise. (Gorenflo, 2010)

2 The way to continuous improvement

According to many studies, for example (Darroch, 2005), effectively managed knowledge and processes are the key to innovations, which then have impact on the financial performance. Essentially, controlling also leads to the continuous creation of innovations (improvements) in the areas of interest in form of remedial and preventive measures aiming to prevent deviations. In this point the connection of controlling system to so-called Deming's PDCA cycle of continuous improving (adapting to external and internal conditions of the company) is clearly identifiable (Bhulyan, 2005).

Within controlling planning takes place (Plan), when targeted values of monitored quantities and the ways (procedures, action) to achieve them are identified. Planning definitely requires existing data, information and knowledge (DIK) of the company. In the next stage (Do) the plans are executed and the actually achieved values of selected attributes are monitored and measured. In this stage new data and information on monitored quantities and on the conditions of the company's economy are acquired. Subsequently the checking takes place (Check), during which deviations from the plan are identified. In the last stage (Act) these deviations and their causes and consequences are analysed and remedial and preventive measures are proposed and subsequently carried out (Čapek, 2014).

Changes (innovations) are made because of the identified deviations that are due to the changes in the external and internal conditions of the company, to which the creation of new DIKs is related. On the basis of existing DIKs and on the basis of the execution of controlling functions (activities) new (innovated) DIKs are created in the organisation, which will be incorporated into a new (improved) plan, will become established in organisation and will become current DIKs to next cycle of improving.

This idea is graphically depicted in figure 1, which presents the mutual link between controlling and knowledge management. At the start the controlling system needs certain existing DIKs as input. These are later replaced with new modified DIKs, which is done on the basis of analyses of changes in the company's environment and analyses of causes and consequences of deviations, and such new DIKs are the output of controlling functions in form of reports and remedial and preventive measures in areas of interest. Therefore controlling can be considered a tool for creation, sharing and utilisation of knowledge within the organisation.

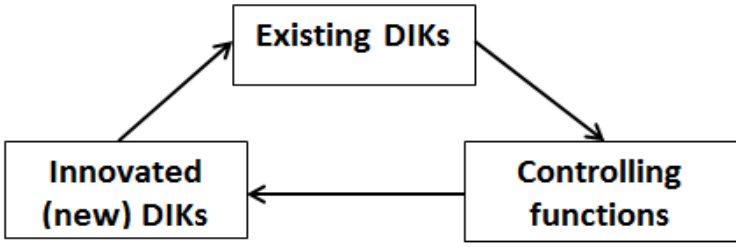

Fig 1: The mutual link between controlling and knowledge management within continuous improvement

Based on the above it can be stated that the shared goal and essence of controlling is, without doubt, the continuous improvement of the organization in various areas.

Within operative controlling it is possible to examine the exploitation of selected management tools supporting continuous improving from four different perspectives. These can be understood as four basic questions of controlling, namely where, what, how and who. The figure 2 graphically presents the controlling system, the underlying basis of which is formed by the mentioned four perspectives (questions).

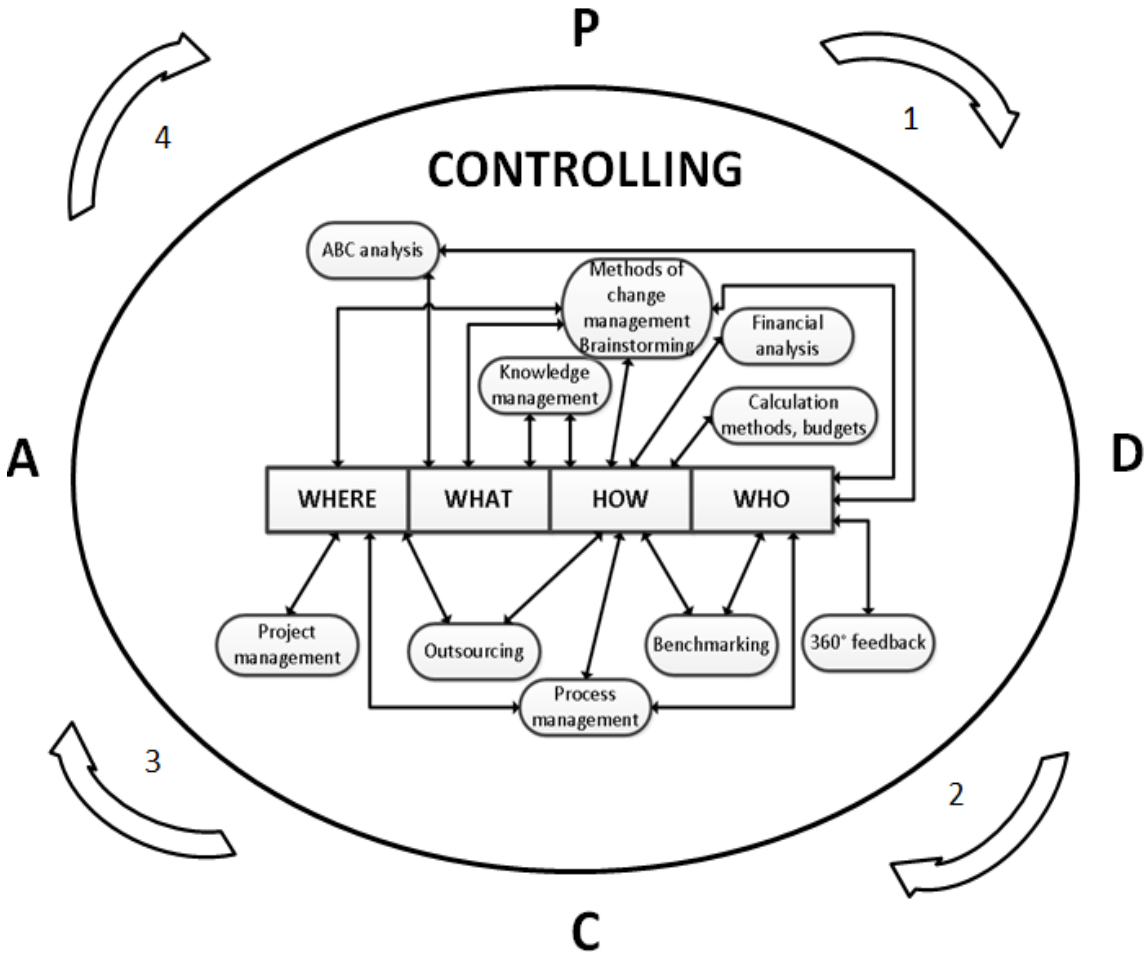

Fig 2: Controlling system interconnected to other management tools

3 Discussion and the conclusion

It is possible to identify connection of controlling system to Deming's PDCA cycle of continuous improving and its stages. The execution of controlling activities, which requires input existing DIKs (input), initiates creation of new (innovated) DIKs, which can be understood as the output of controlling functions. Controlling can be considered as a tool for creation, sharing and utilisation of knowledge in the organisation. Implementation of knowledge as well as process management supports the role and importance of controlling system in point of continues improvement. This all has influence on increasing number and quality of innovations and finally on economic (financial) performance.

Innovated DIKs, which are gained by controlling procedures with support of knowledge and process management, are one of the most beneficial pieces of knowledge that provide for the improvements in the activities of employees, especially in the economic, technical and business spheres.

The graphic model of the controlling system connected to other management tools, representing individual possible links between selected tools and controlling perspectives, needs to be further developed in future. Especially a more detailed analysis of individual links and the identification of particular contact points and conditions, under which these links create benefits, are appropriate.

Abstract

The paper addresses the issue of the Russian stock market efficiency. Despite the growing controversy the efficient-market hypothesis has been widely applied. However, empirical findings on market efficiency are sometimes mixed. Besides, financial situation can dramatically change. It especially concerns emerging markets where there is still plenty room for research. This paper focuses on the Russian stock market's efficiency, mainly on two groups of hypotheses. The first group concerns the distribution of stock returns. The second group implies testing weak-form efficiency. To check the hypotheses, we studied the sample of 20 equities' and the main market indices' daily prices for the period from April 23, 2009 to January 22, 2016. The selected stocks comprises the Russian stock market in terms of capitalization. The study period was reasoned by the requirement of data comparability. The hypothesis of normal distribution was rejected. Therefore, to study the weak-form efficiency we applied a nonparametric statistical method (runs test). It was proved that the market remains weak-form efficient despite unfavorable conditions. The results of the research can be useful for financial decisions and market regulation relative to the Russian Federation.

Keywords: financial market efficiency, informational efficiency, weak-form efficiency, the Russian stock market efficiency.

1 Introduction

Since 2014, the Russian Federation has been faced strong economic end external risks, deriving dramatic challenges for financial market functioning. This determines the context of our research which is aimed to prove that the Russian stock market still remains efficient. We assume that economic transparency and financial market efficiency are important preconditions for the financial system soundness. Simultaneously, the more soundly a financial system functions, the more competitive an economic model becomes (Cihak et al., 2012).

According to the efficient-market hypothesis (EMH), financial markets should be efficient. The fundamentals of EMH were initially formulated by Samuelson (1965) and Fama (1965, 1970). Popular EMH definitions can also be found in the works of Jensen (1978), Malkiel (2003), and Timmermann and Granger (2004). The controversy about market efficiency has grown as a result of the global financial crisis (Ball, 2009; Krugman, 2009). However, EMH has been widely applied in finance and has been tested for various countries.

For Russia, the works of Dorofeev (2000), Abrosimova et al. (2002), Hall and Urga (2002), Worthington and Higgs (2003), Anatolyev (2005), and McGowan (2011) must be noted. There are other relevant works in Russian: Nalivaysky and Ivanchenko (2004), Botvinnik and Kozyrev (2008), Fedorova and Andreeva, (2012), Fedorova et al. (2013), Darushin and Lvova (2015).

Worthington and Higgs (2003) disproved the weak-form efficiency in the Russian market for the period from January 1994 to May 2003. They tested EMH on the basis of Morgan Stanley Capital International (MSCI) equity indices for 16 developed and 4 emerging markets, applying a variety of methods (serial correlation coefficient test, runs test, three unit root tests, and multiple variance ratio tests). Notably, not all developed markets corresponded with the strictest random walk criteria.

On the contrary, the hypothesis of weak-form efficiency for the Russian financial market was supported by Abrosimova et al. (2002) for the period from September 1995 to May 2001 (Dorofeev (2000) comes to the same results for the early, but a shorter period from January 1997 to June 1998). The authors applied unit root, autocorrelation and variance ratio tests to evaluate the predictability of the Russian Trading System Index (RTS index) time series. The random walk hypothesis was proved for the monthly data and rejected for weekly and daily data. Linear and nonlinear modeling of the serial dependence provided limited evidence of short-term market predictability.

The same conclusion was reached for later and longer periods by several other researches. Nalivayskiy and Ivanchenko (2004) tested and proved the weak-form efficiency hypothesis for the period from January 2000 to April 2004 using regression analysis and nonparametric tests for a daily data on the RTS index. Anatolyev (2005) analyzed weekly series of Russian stock returns from 1995 to 2004 using nonparametric methods (the excess profitability test of Anatolyev and Gerko) and confirmed the weak-form market efficiency. McGowan, Jr. (2011) evaluated the efficiency of the Russian financial market by applying runs and unit root tests for the period from September 1995 to June 2007 and found that the RTS index was generally weak-form efficient with the exception of 1995-1999.

Special attention should be paid to the dynamic models of EMH testing. Hall and Urga (2002) analyzed returns from the RTS and Skate Press Agency General (ASPGEN) indices and a small sample of frequently traded stocks by applying a time-varying parameter model with generalized autoregressive conditional heteroscedasticity in mean (GARCH-M) structure of the residuals. The analyzed data covered the period from September 1995 to the end of March 2000. The authors found that the Russian financial market was initially inefficient. Then, they observed the tendency toward weak-form efficiency both for the indices and for the sample of individual stocks. Unsurprisingly, the result for the RTS index, which is based on the most liquid stocks, was better than for the wider ASPGEN index. This study proved that it took approximately two and a half years for the Russian market to become less autocorrelated in terms of the RTS index.

The GARCH-M model was also applied by Botvinnik and Kozirev (2008), who tested daily data on the RTS index since September 1995 through April 2007 and found that the weak-form efficiency in the Russian financial market was observed not before 2000-2001. Fedorova et al. used the same method for the spot-prices of the MICEX index and come to conclusion that during the period December, 2000–December, 2012 the market did not move towards information efficiency (2013).
Surprisingly, findings concerning the Russian stock market efficiency are mixed even within one article (Fedorova and Andreeva). One of the main reasons for such contradictory conclusions applies to the emerging status of the market and, consequently, the lack of its operational efficiency (Darushin and Lvova, 2015). It has not been yet developed in terms of depth, access, efficiency, and stability. The same time, it continues changing and developing. Therefore, empirical research of the Russian stock market should be regularly revised, updated and improved.

2 Methodology

According EMH, there are three forms of informational efficiency: weak, semi-strong, and strong. A market is supposed to be efficient with respect to some information set if it is impossible to make economic profit by trading on the basis of this information set (Jensen, 1978). There is no strong efficiency in the real world. The form of real (weak or semi-strong) efficiency depends on the information which constitutes the abovementioned set. In particular, the weak form of efficiency means that the information set contains price history of the market (asset prices, dividends and variables such as trading volumes) (Jensen, 1978; Timmermann and Granger, 2004). And one cannot

make profit by trading on the basis of past information (technical analysis is useless). Practically, a weak-form informational efficiency is suggested if there is a random distribution of corresponding stock prices (or returns).

Emerging financial markets are inefficient or weak-form efficient. The majority of research suggests that the Russian stock market can be characterized as weak-form efficient. The possible drawback of such empirical research is commonly related to the fact that analyzed variables are assumed to be normally distributed. If normality does not exist, this factor should be taken into account when choosing statistical methods for efficiency evaluation. However, the choice of assessment methods is not always correct. In this regard, *the first question* of our research addresses of whether the stock returns are normally distributed.

The null and alternative hypotheses are the following:
H_o: Stock returns for the Russian stock market follow a normal distribution.
H_1: Stock returns for the Russian stock market do not follow a normal distribution.
Several statistical methods are used to test normality. However, considering results for the earlier period (Darushin and Lvova, 2015) and for emerging markets on the whole (Innovations on Financial Markets, 2013), it is highly probable that there is no normality. Therefore, we confine ourselves to the skewness and kurtosis analysis.
Then, we will turn to *the second (and the main) question* of the research: does the Russian stock market remain efficient? The null and alternative hypotheses are:
H_o: The market can be characterized as weak-form efficient.
H_1: The market cannot be characterized as weak-form efficient.
Weak-form informational efficiency is stated if there is a random distribution of corresponding stock prices (or returns). If the distribution is not normal, this factor should be taken into account when choosing statistical methods for efficiency evaluation. It requires applying nonparametric methods, for instance, the runs test.
To test both hypotheses, we will study the sample formed by the daily prices of 20 equities. They represent the largest Russian companies listed on the Moscow Exchange (MOEX) and the bulk of the main MOEX indices – MICEX and RTS. The total share of these equities in this indices is almost 90% (Tab. 1).

Table 1: Sample Stocks of the Study

#	Company Name	Stock Type	Trading System Ticker	Weight in the RTS-MICEX Index* (%)	Number of Prices**
1.	Public Joint-Stock Company “Gazprom”	Ordinary share	GAZP	14.53	1,691
2.	Public Joint Stock Company “Oil company “LUKOIL”	Ordinary share	LKOH	12.15	1,691
3.	Sberbank of Russia	Ordinary share	SBER	12.06	1,691
4.	Public Joint Stock Company “Magnit”	Ordinary share	MGNT	6.58	1,691
5.	Joint Stock Company “NOVATEK”	Ordinary share	NVTK	6.12	1,691
6.	Public Joint Stock Company “Mining and Metallurgical Company “NORILSK NICKEL”	Ordinary share	GMKN	5.12	1,691
7.	VTB Bank (public joint-stock company)	Ordinary share	VTBR	4.31	1,691
8.	Rosneft Oil Company	Ordinary share	ROSN	4.29	1,691
9.	“Surgutneftegas” Open	Ordinary	SNGS	4.03	1,691

#	Company Name	Stock Type	Trading System Ticker	Weight in the RTS-MICEX Index* (%)	Number of Prices**
	Joint Stock Company	share			
10.	Oil Transporting Joint Stock Company "Transneft"	Preferred share	TRNFP	3.40	1,691
11.	"Surgutneftegas" Open Joint Stock Company	Preferred share	SNGSP	2.98	1,691
12.	PJSC "TATNEFT"	Ordinary share	TATN	2.80	1,691
13.	Mobile TeleSystems Public Joint Stock Company	Ordinary share	MTSS	2.58	1,682
14.	Public Joint Stock Company "ALROSA" *(data from 29.11.2011)*	Ordinary share	ALRS	1.35	1,042
15.	Public Joint Stock Company "Severstal"	Ordinary share	CHMF	1.34	1,691
16.	Public Joint Stock Company "Moscow Exchange MICEX-RTS" *(data from 15.02.2013)*	Ordinary share	MOEX	1.29	735
17.	Public Joint-Stock Company Federal Hydro-Generating Company – "RusHydro"	Ordinary share	HYDR	1.06	1,690
18.	Public Limited Liability Company Yandex N.V. *(data from 04.06.2014)*	Shares of a foreign issuer	YNDX	1.02	410
19.	Public Joint Stock Company "MegaFon" *(data from 28.11.2012)*	Ordinary share	MFON	0.96	786
20.	Polymetal International plc *(data from 20.06.2013)*	Shares of a foreign issuer	POLY	0.86	643

Note. * Total for 20 stocks: 88.83%; ** End of the study period: 22 January 2016.
Source: Prepared by the authors.

It should be noted that the Moscow Exchange (MOEX) is the main stock exchange in Russia. It was founded in December 2011 as a result of a merger between Russia's two major exchange groups: MICEX group (Moscow Interbank Currency Exchange) and RTS group (Russian Trading System). MOEX provides almost all transactions with securities and derivatives in Russia, so it represents the securities market as whole. A limited number of regional exchanges were acquired by MOEX or serve a small part of local transactions. Therefore, we assume that the sample (Tab. 1) comprises the Russian stock market in terms of capitalization.

At present all stock in the trades are accounted for by the Moscow Exchange. In the past, however, the deals were provided by two different exchanges with different trading and execution rules. The sample therefore consists of only the stocks that were traded with the same procedures during the studied period. To provide information identity, we chose the stock segment that was not changed during the time. This is the *RTS Standart* sector of RTS before the merger and the MOEX Standard sector at present. The RTS Standart began on April 23, 2009.

According to the securities quotes provided by the MOEX database, we used the daily closing prices of the selected stocks to calculate the return as:

$$r_{i,t} = (P_{i,t} - P_{i,t-1})/P_{i,t-1} \quad (1)$$

where $r_{i,t}$ is the return of stock *i* at day *t*, $P_{i,t}$ is the stock price at day *t*, $P_{i,t-1}$ is the stock price at the previous trading day. The prices exclude dividends.

To check the results calculated by the equities prices, the daily data on the MICEX and RTS indices will be used as well. As for the period of analysis, we will use the data from the equity listing on the MOEX to the present date. Period for indexes will be taken from the beginning of the calculation.

3 Results

To test the normality we applied skewness and kurtosis analysis. These techniques are well known and widely used in social and economic research. The results of the yield distribution analysis are shown in Tab. 2, 3.

Tab. 2 shows the results of the normality test carried out for the whole study period from April 23, 2009 to January 22, 2016.

Table 2: Results of Normality Test
(For the whole study period: April 23, 2009 – January 22, 2016)

Notes. * The same number as in Tab. 2; ** Standard errors in parentheses are computed as $\sqrt{6/N}$ for skewness and $\sqrt{24/N}$ for kurtosis, where *N* is the number of observations (returns).
Source: Authors' calculations.

The values that correspond to the normal distribution are shown in brackets, and the actual values are without brackets. In two cases, the actual values of skewness are less than normative (highlighted in dark gray). The kurtosis statistics exceeds normative level for all 20 equities. However, in general, the obtained values are greater than the normative.
The same calculations were run for the sample of the last 250 values of returns for every date from April 23, 2010 to January 22, 2016. Thus, skewness and kurtosis were calculated as moving indicators on the data for the last year. We used 250 as a number of days in a year, and not 252 as usual, because it corresponds to the number of trading days on the Russian stock market. Generalized results are shown in Tab. 3.

Notes. * The same number as in Tab. 2; ** Normative values are computed as $\sqrt{6/250} = 0{,}15429$ for skewness and $\sqrt{24/250} = 0{,}30984$ for kurtosis, where 250 is the number of observations (returns). Source: Authors' calculations.

It is evident that in most cases skewness, kurtosis, or both of them do not correspond to a normal distribution (actual values greater than normative). But in some cases both indicators match the conditions of normality (both skewness and kurtosis statistics are less than standard errors). For example, in 52 cases from 1441 (3.61% of observations) the returns of stock #1 corresponded to the normal distribution. For stock #12 it was more than 14% of observations. Of course, in general, the number of such cases is rare small. It exceeds 1% of observation for 7 stocks only. But, it turns out that the wrong choice of a date or a period of the study may distort the results. The economic implication is that at certain periods, prices and returns behave differently than usual.

In general, the hypothesis of normal distribution of the selected stocks returns is disproved. However, to generalize our findings for the whole market, we also used the same tests for the most representative market indices (Tab. 4, 5).

Source: Authors' calculations.

All the results (Tab. 2 – 5) reject the hypothesis of the normal distribution and force us to use nonparametrical methods to test the randomness of stock returns. We chose the runs test, since unlike other standard methods such as serial correlation, etc., the runs test does not require normal distribution of stock yields.

A *run* is defined as sequence of the return change with the same sign. For example, the line ++ 0 – – – + shows seven return changes with four runs. The sign + shows positive stock return or the price growth; – represents the negative yield of the stock and the price declining; 0 means unchanged stock return and price. In some cases, the runs test uses only two types of runs and ignores the 0 (e.g., Wald-Wolfowitz runs test), but this method is not appropriate for the Russian stock market because the runs with no change are presented.

If a sample shows too many or too few runs versus the number of runs expected in a random series, it means nonrandomness. Too few runs indicate that the stock yields in the time series do not change signs regularly, therefore showing a positive serial correlation, and, as a result, may suggest that price changes do not follow a random walk model. If there are too many runs, a negative autocorrelation may occur.

The total expected number of runs (*E(R)*) can be calculated as:

$$E(R) = \frac{N \cdot (N+1) - \sum_{i=1}^{3} n_i^2}{N} \quad (2)$$

where N is a total number of returns changes, n_i is the number of changes of each sign (+, –, 0). For large samples with more than 30 observations, the distribution of $E(R)$ can be accepted as normal with the standard error, which can be calculated as:

$$\sigma(R) = \sqrt{\frac{\sum_{i=1}^{3} n_i^2 \cdot [\sum_{i=1}^{3} n_i^2 + N \cdot (N+1)] - 2N \cdot \sum_{i=1}^{3} n_i^2 - N^3}{N^2 \cdot (N-1)}} \quad (3)$$

The standard normal Z-statistics used for runs test is given by:

$$Z = \frac{(\overline{R \pm 0.5}) - E(R)}{\sigma(R)} \quad (4)$$

where R is the actual number of runs, $E(R)$ is expected number of runs, and 0.5 is continuity adjustment. For large number of observations (N), Z is normally distributed with a mean of zero and variance of one. Thus, for tests of significance we apply a standardized normal variable Z-test. The result can therefore be accepted at significant at the 5% level if the absolute observed values of Z are less or greater than ±1.96. The results of corresponding calculations are reported in Tab. 6.

Table 6: Runs Test Results

Stock #*	*N*	*R*	*E (R)*	*σ (R)*	*Z***	Z_{min}***	Z_{max}***

MICEX index	1,690	865	846.50	35.58	0.52	-0.71	1.14

Notes. * The same number as in Tab. 2; ** *Z* as computed for whole study period (23.04.2009-22.01.2016);

*** Z_{min} and Z_{max} are lowest and greatest from Z-scores calculated as a moving indicators on the data for the last 250 days (1 year), from 23.04.2010 to 01.22.2016.
Source: Authors' calculations.

At the 5% significance level, all the stocks from the sample show Z values within the limit (±1.96). 45% of stocks (9 from 20) have negative standardized variables (Z). This finding means that the actual number of runs was less than expected. For generalizations, we also added to the calculations the results of the runs test for the RTS and MICEX indices, which produced the same results as the most of the sample stocks. This indicates that the stock prices traded on the Russian stock market follow the random walk model. Therefore, the null hypothesis of the stock prices random walk cannot be rejected and hence, the results suggest the weak-form efficiency of the Russian securities market.

4 Conclusion and Discussion

As indicated above, the yields of sample stocks that comprise almost 90% of the Russian stock market are not normally distributed. Correspondingly, the weak-form efficiency was studied by the nonparametric statistical method. It was proved that the market remained weak-form efficient despite unfavorable conditions. Thus, in financial decisions relative to the Russian Federation, domestic and foreign investors should practice appropriate methods and modify them according to our results. In particular, the predictive power of technical analysis has been still limited. One more implication relates governmental officials monitoring and regulating the market, in the first instance its transparency.

In this regard, it should be noted that regulative and other institutional changes are sometimes taken into account when testing the efficiency of the Russian financial market. In particular, some authors appeals to improvements in market infrastructure (Fedorova and Andreeva, 2012; Fedorova et al., 2013). These changes are examined since they affect the level of operational efficiency, which in turn is a significant precondition for the informational efficiency. However, it seems quite logical to study the possible interconnection between the market efficiency and some key economic indicators. The main theoretical problem in this case concerns measuring the level of informational efficiency. Let us stress that there has been no generally accepted indicator of informational efficiency yet. This, in our view, determines a possible prospective way for further research.

Effects of Value Added Tax (VAT) Reduction on Tourism in Romania

Stoicea Paula and Burcea Mariana

University of Agricultural Sciences and Veterinary Medicine of Bucharest, Romania

Abstract

The Romanian tourism is a controversial and current topic, which is one of the sectors with high potential for economic growth and development at national level. Introducing the fiscal relaxation in the tourism sector (VAT - value added tax-from 24% to 9%) for all accommodation services, for "all inclusive" services, starting from January 2015 may lead to stimulate the tourist demand and thus economic growth. In this article, we shall analyze the impact of VAT reduction to 9% at one year from implementation and its effects on the current situation of the tourism sector in Romania, based on the statistical data available at national level. In order to highlight the aspects related to the benefits that such a measure may have on the national economy, we conducted a SWOT analysis (Strengths, Weaknesses, Opportunities, and Threats), by which we updated the strengths, weaknesses, opportunities and threats in this sector, in order to formulate some recommendations, so that the Romanian tourism becomes competitive and visible at international level. The conclusions after analyze, highlight the idea that introducing fiscal relaxation in tourism brings contributions to the development of this sector, which may compensate the budget deficit through revenue increases brought by increasing the tourists flows.

Keywords: value added tax, tourism, tourist flow, SWOT analysis

Introduction

In Romania, VAT reduction to 9% for all accommodation services, starting from January 2015 contributed to increase of the number of foreign tourists visiting our country and to increase the revenues of the tourism operators and related sectors, a situation seen in other countries, too (Blake at all, 2006; Agell at all, 1996).

VAT is an indirect tax of the state budget, being the most important resource borne by the final consumer and it is charged on cascade by each economic agent that participate in the economic cycle of manufacturing a product, service or work for taxation purposes (Mc Gee, 2008). Through the monetary and fiscal policies (the budget tourism, ways of income tax, VAT level) the state can encourage or stimulate the tourism demand (Manente, 2010).

The adjustment of VAT on tourism services, represents a first step in the revival of the domestic tourism, reflected in the reduction of tariffs and in increase of foreign and domestic tourists arrivals in the tourists reception units (Angeloni, 2013; Manente at all, 2008). This analysis begins with a key question: "Does the reduction of the taxation in the tourism sector represent a growth factor for increasing the tourist flows visiting Romania annually?" Through the analysis based on data supplied by NIS (National Institute of Statistics) in the period January 2015 - December 2015, period overlapped the measure of fiscal relaxation from 24% to 9%, as well as SWOT analysis, we found the answer to this question. In this context, we propose to analyze the evolution of tourist flows, during the period when the measure of fiscal relaxation in tourism (VAT 9%) is active.

The results of these analyzes will form the basis for issuing some proposals from the authors, on the revival of the Romanian tourism, by economic and fiscal measures, which bring contributions in this sector (Minciu, 2004).

Material and method

In order to determine the effects that reducing VAT from 24% to 9% recorded in tourism in the period January 2015 (the date on which this fiscal measure was introduced) until the end of 2015, we conducted an analysis based on national statistics data. By comparing the data from the current period with the same period (January-December 2014), it was outlined a set of indicators, based on SWOT analysis, in order to highlight the qualitative and quantitative effects in the tourists flow.
Absolute deviation indicator, determined for the tourist flows recorded in Romania in the period January-December 2015, was calculated as the difference between their value, from the beginning to the end of the period, recording positive values respectively negative ones.
Relative deviation indicator, restored the percent increase and decrease of the tourist flow in the analyzed period. The study was based on documentation and a rich bibliographical study, in which information from the national reports of various agencies in the area (NIS) was used, specialty papers and national strategies for tourism revival.

Results and discussions

The tourism sector in Romania, was affected long time by a lack of some general and fiscal policies to encourage its long-term development, Romania is a country with significant unused tourism potential. In the Master Plan for The National Tourism Development 2007-2026, our country has established objectives to be achieved by 2026 (Erdeli at all, 2011).

Table 1: Arrivals and overnight stays in the tourist reception units with accommodation functions

Specification	Arrivals				Overnight			
	December 2014 - thousands	December 2015 - thousands	Deviation		December 2014 - thousands	December 2015 - thousands	Deviation	
			Absolute - thousands - (+/-)	Relative % (+/-)			Absolute - thousands	Relative %
Total, of which:	548.5	655.8	+107.3	+119.6	1146.1	1333.2	+187.1	+116.3
Romanian tourists	438.2	527.8	+89.6	+120.4	926.6	1068.6	+142	+115.3
Foreign tourists, of which:	110.3	128.0	+17.7	+116.0	219.5	264.6	+27.1	+120.5
Europe	83.9	92.3	+8.4	+110.0	163.1	183.8	+20.7	+112.7

Source: Own computation based on the date from National Institute of Statistics, Bucharest 2016.

Besides the aspects related to proper development of the material and technical base of tourism, an important aspect is attracting Romanian and foreign tourists by promoting and offering competitive prices, justified and aligned with those in the countries neighboring Romania (Zaman at all., 2013).

The promotion of Romania as a tourist destination, is an important aspect of creating and implementing a national tourism strategy, through improvements in the legislative area, fiscal facilities and solutions in the tourism sector (Pop at all, 2008).
Without being considered strategy in tourism, VAT reduction for all tourist services, a year of implementation, brought an increase in the number of tourists (arrivals and overnight stays) and consequently the revenue collected in Romania. Thus in December 2015 compared to December 2014 arrivals and overnight stays in the tourists reception units with accommodation functions, recorded increases by 19.6% respectively 16.3%, according to NIS. Analyzing the data from NIS, it is find out that in the analyzed period the absolute and relative deviation recorded positive values, representing an increase of both arrivals and overnight stays in the tourist units with accommodation functions. Regarding the arrivals, the total number recorded in December 2015 was 655. 8 thousand, with an absolute deviation of 107.3 thousand compared to the same period in 2014 the positive relative deviation being of 19.6%.

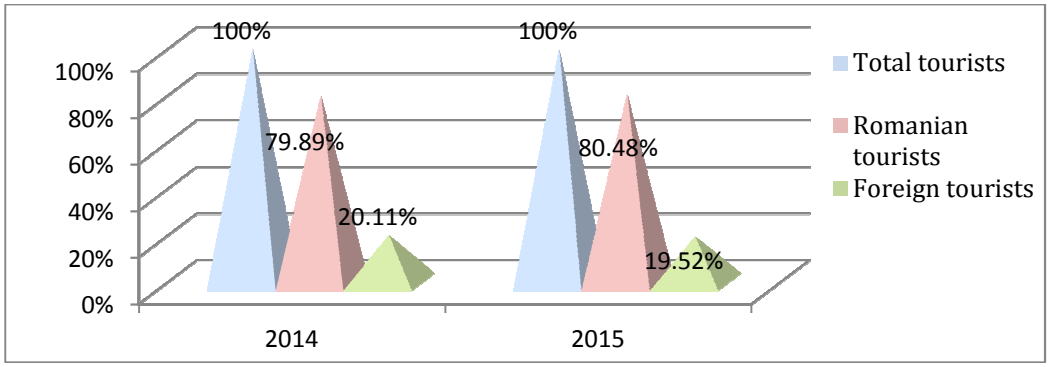

Figure 1: Arrivals in tourist units with accommodation functions

In 2014, most tourists were Romanians, representing 79.89% of the total arrivals in tourist units with accommodation functions, of which only 20.11% foreign tourists. In 2015, the Romanian tourists were also majority, in total representing 80.48% of which arrivals of foreign tourists 19.52% (Table 1).
Regarding the absolute deviation of arrivals in tourist units with accommodation functions, it was positive, representing an increase over the same period in 2014, 89.6 thousand, representing 20.4% relative deviation (Fig 1).

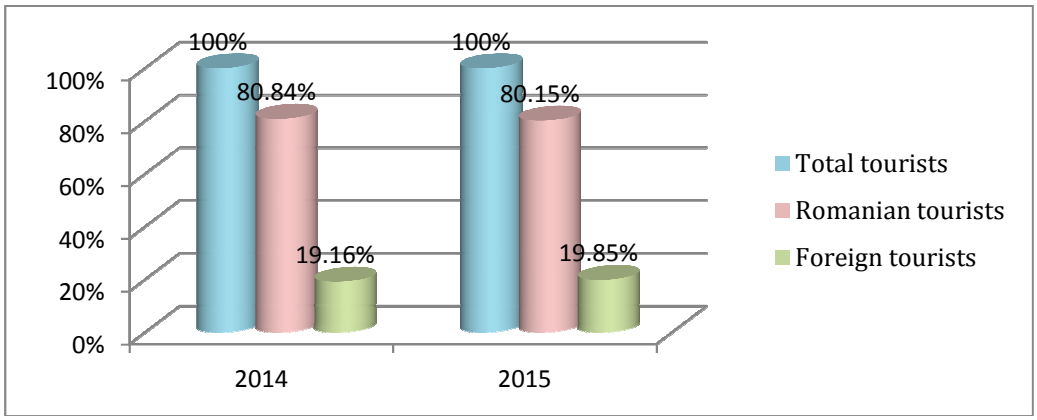

Figure 2: Overnight stays in tourist units with accommodation functions

In December 2014, from the total number of overnight stays spent in tourist units with accommodation functions, the Romanian tourists occupied a percent of 80.84%, while 19.16% were foreign tourists. In 2015 the situation is similar, Romanian tourists occupying a percent of 80.15% and the percent of foreign 19.85% of the total tourists (Figure 2). Regarding the absolute deviation of

overnight stays in tourist units with accommodation functions in December 2015, it is found out an increase in the number of overnight stays by 187.1 thousand compared to 2014. This aspect highlights a positive relative deviation, increasing by 16.3% over the same period last year. This increase in the number of overnight stays, is a consequence of VAT reduction from 24% to 9%, which led to a reduction in tariffs on accommodation but also in all-inclusive travel packages.

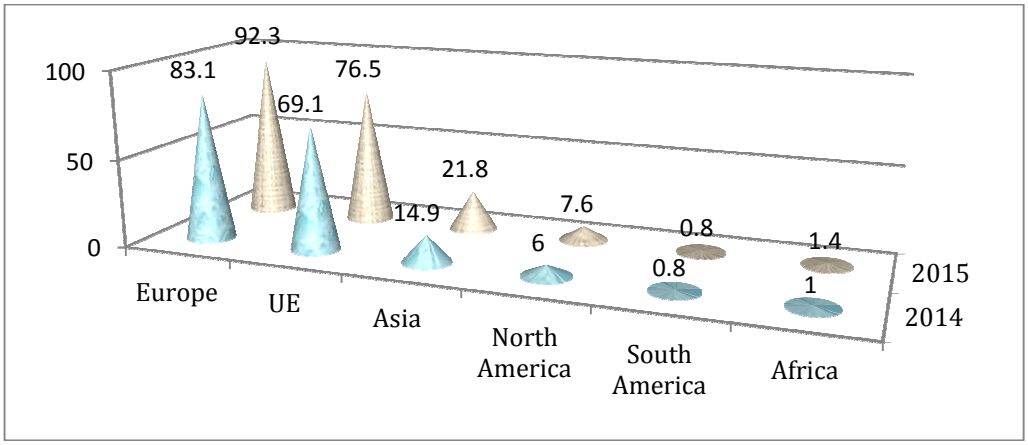

Figure 3: Arrivals in tourist units with accommodation functions, depending on tourist origin. Source: National Institute of Statistics, Bucharest, 2016

Regarding the arrivals of foreign tourist in the tourist units, the highest percent was in Europe, (76.06% in December 2014 and 72.10% in December 2015), and of these 82.35% (December 2014) and 82.88% (December 2015) were the countries belonging to the European Union (figure. 3).

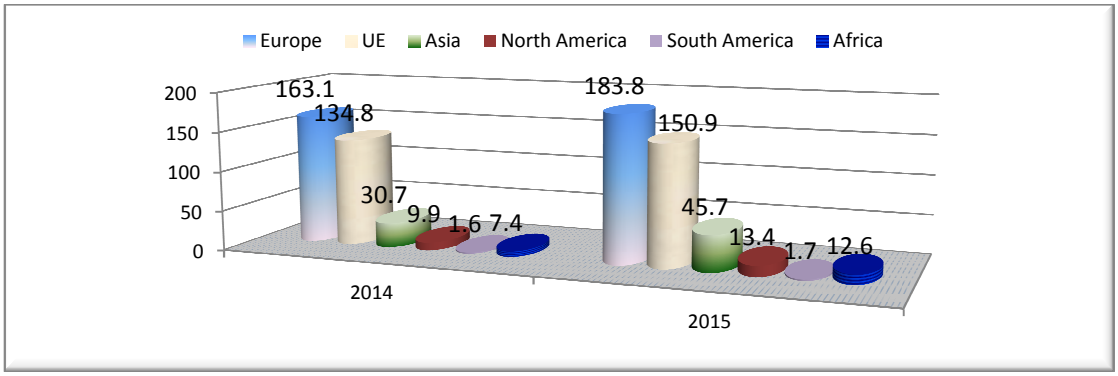

Figure 4: Overnight stays in tourist units with accommodation functions, depending on tourist origin. Source: National Institute of Statistics, Bucharest 2016

Analyzing the foreign tourists overnight stays in the tourist units, it is observed that most foreign tourists who spent the night in our country came from Europe (183800) increased by 10.92% compared to 2014 and 134800 tourists from EU with an increase of 10.66% compared to the same period of the previous year (figure 4).

Also, at other categories of tourists coming from Asia, North America, South America and Africa, increases were recorded in December 2015 compared to the previous year, although numerically, their overnight stays in the tourist units were much lower than on the European continent. In December 2015 compared with the same month of 2014, there were increases of foreign tourists, regarding the tourist demand for tourist units in the resorts in the mountain area, which has a positive

deviation of 0.2%. Also in spas, a positive deviation of 0.4% was recorded (Table 2). In the other tourist areas the deviations recorded were negative compared to the same period of 2014 (0.2%).

Table 2: Distribution of the Romanian and foreign tourists in the tourist units, on tourist areas

No.	Favorite tourist area	Foreign tourists			Romanian tourists		
		December 2014	December 2015	Deviation (+/-)	December 2014	December 2015	Deviation (+/-)
1	Bucharest and towns county residence	83.9	83.7	-0.2	45.9	47.7	+1.8
2	Other cities and tourist routes	9.9	9.7	-0.2	19.6	18.9	-0.7
3	In mountain resorts	4.4	4.6	+0.2	24.6	22.6	-2.0
4	Resorts in the spa	1	1.4	+0.4	8.7	9.7	+1
5	Seaside area	0.6	0.4	-0.2	0.9	0.8	-0.1
6	Delta area, including Tulcea city	0.2	0.2	0	0.3	0.3	0

Source: Own computation based on the date from National Institute of Statistics, Bucharest 2016

The foreign tourists chose the capital cities, in order to have a business travel or tourism for medical purposes (preference for private health system in Romania, with lower costs than in their countries of residence) (figure 4).

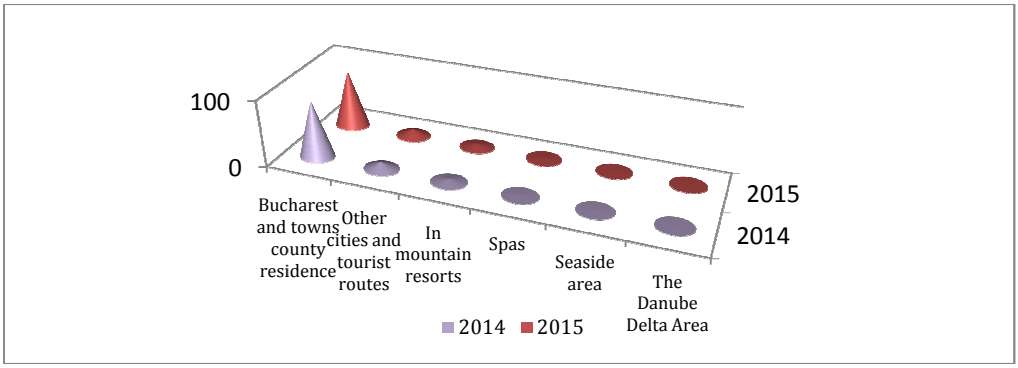

Figure 4: Preferences of foreign tourists as regards chosen destination, in 2015

This statistic highlights the importance of infrastructure in choosing the destination by the foreign tourists, considering that in big cities it is more developed than in the mountain resorts, spas, coastal or in the Danube Delta (Stefan at all, 2015). The Romanian tourists chose Bucharest as destination and the capital cities, with a positive deviation of 1.8% compared to the same month last year, namely in the spa resorts (positive deviation of 1%).

Other destinations have recorded negative deviation of the demand of Romanian tourists and were between 0.7% and 2%. A singular case, is the Danube Delta area, including Tulcea county, where the tourism demand of Romanian and foreign tourists is stationary during the survey period, not recording deviations.

Table 3: SWOT analysis in Romania, following the application of fiscal facility, of VAT reduction to 9%

S – Strenghts	**W – Weaknesses**
✓ Existence of exceptional heritage tourism: varied natural resources, history, culture and traditions with wide diversity; ✓ Temperate climate of Romania can attract the tourist throughout the year. ✓ Low prices for all-inclusive packages and those that include accommodation too, as a result of fiscal relaxation (9% VAT) ✓ A slight increase in the number of tourists due to the VAT reduction from 24% to 9% a year from applying the fiscal measure. ✓ Preferences of the foreign tourists in 2015, as regards visiting Bucharest and the capital cities in order to practice business tourism or medical tourism.	✓ Low number of tourists arriving in Romania compared to abroad departures, the existence of the negative balance of tourism. ✓ Insufficient promotion of Romanian tourism at internal and international level. ✓ Poor quality of services and of all tourism standard, which determines the decrease of population trust in Romanians and preference for foreign destinations confirmed ✓ Modernized infrastructure and difficult to use for rapid travels. ✓ Extremely low paid staff. ✓ High tariffs practiced in tourism even by VAT reduction from 24% to 9% compared to the quality of services. ✓ Non directing the state policies in order to encourage practicing the tourism to the real potential that Romania possesses.
O – Opportunities	**T – Threats**
✓ Tourism heritage with undisputed value, an optimal measure that should lead to put into application some multiple and inspiring forms of tourism, including agro-tourism, eco-tourism, health tourism, etc. ✓ Fiscal relaxation in the tourism sector, an optimal measure that should lead to the implementation of some measures and governmental strategies, in order to support as much as possible the development of the Romanian tourism. ✓ Existence of the European funds needed for the tourism development and its support infrastructure.	✓ Massive competition as quality of services and tariffs practiced in the European countries with tradition in this sector. ✓ Low efficiency of the government strategies implemented in the tourism sector, ✓ Lack of monitoring and evaluation of the effects of the strategies applied in tourism, by the competent institutions. ✓ Low degree of absorption of the European funds for the tourism development in the period 2007-2013. ✓ The lack of visibility at international level of the tourism resources provided by Romania.

Following the analysis and study made in this sector, it is proposed to continue the introduction of fiscal measures in tourism, for the consumer's benefit but also for the stakeholders involved in this sector through the reduction or cancellation of taxes in order to develop the technical and material base and to increase the quality of services provided. These fiscal measures needed to stimulate the Romanian tourism could address the following aspects (figure 6).

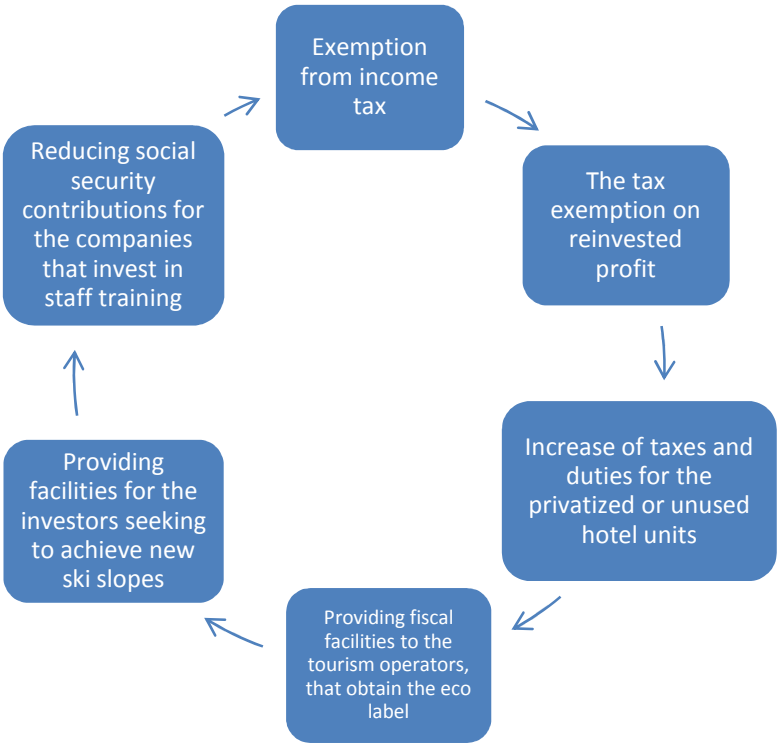

Figure 6: The fiscal measures necessary to stimulate the Romanian tourism

Conclusions

In order to develop tourism in Romania, a sustainable, important measure, would be the reduction or cancellation of some taxes and duties and their application non-unitarily, depending on the specific of activity in the national economy. From the secondary analysis of data, we can conclude that the number of arrivals and overnight stays in the tourism units with accommodation, increased during 2015, compared to the same period in 2014. There were increases both at arrivals and overnight stays of foreign tourists but especially the Romanian tourists, increase interpreted also in the context of VAT reduction from 24% to 9%.The net use of tourist accommodation capacity in operation, is relatively low but slightly increasing compared to the same period last year and it shows that the promotion of the tourism sector is an important factor in this regard. Foreign tourist who visited Romania, are most of them from Europe and from the European Union, the tourists from the other continents having low share in total arrivals, departures-arrivals report for Romania being subunitary. It is proposed to introduce new measures of fiscal relaxation in tourism, measures that aim both at the beneficiary of the tourism act, and the stakeholders involved in this field: investors, owners of tourist accommodation structures, catering, craftsmen, etc.

Open Innovation as a Competitive Advantage, Process of Implementation

Ing. Ivana Čermáková, Ing. Simona Činčalová
ivana.cermakova1@student.upce.cz, simona.cincalova@student.upce.cz
University of Pardubice, Faculty of economics and administration, Czech Republic

Abstract

Nowadays, innovation is a very hot topic. The authors choose a part of it – open innovation, which is a trending theme in innovation management. Open innovation is the new imperative for creating and profiting from technology. The paper aims to define the basic concepts relating to innovation (how to make an innovation culture) and open innovation and to make a model of process how to take a change. Every innovation is a process of change and our model will be modified to open innovation.
Key words: innovation, open innovation, process of change

1. Introduction

Companies are constantly faced with the challenge of gaining competitive advantage over competitors. Developing that special edge may mean survival for some of a way to stay on the top of the competition for others. A critical ingredient for staying on the top is an innovation. To be innovative is seeing things from new angles, having broad perspectives, taking risks and being flexible.

Managing the process of innovation in the companies is great and endless topic of contemporary business. Globally successful companies create the conditions deliberately to enable ideas within the company not only formed, but to be implemented and to become the competitive advantage. Innovation is still seen as a critical drive of economic performance.

Main output of this paper is created process of implementation of open innovation which can help gain competitive advantage for a company. Process covers all phases of implementation of innovation. Process can be extended or adapted to the individual needs of concrete situation in concrete company or public institution.

2. Theoretical basis

Engel et al. (2015) defined innovation management „from the market to the market“ and manipulate five areas to improve their innovation performance and drive sustainable and profitable growth (Figure 1).

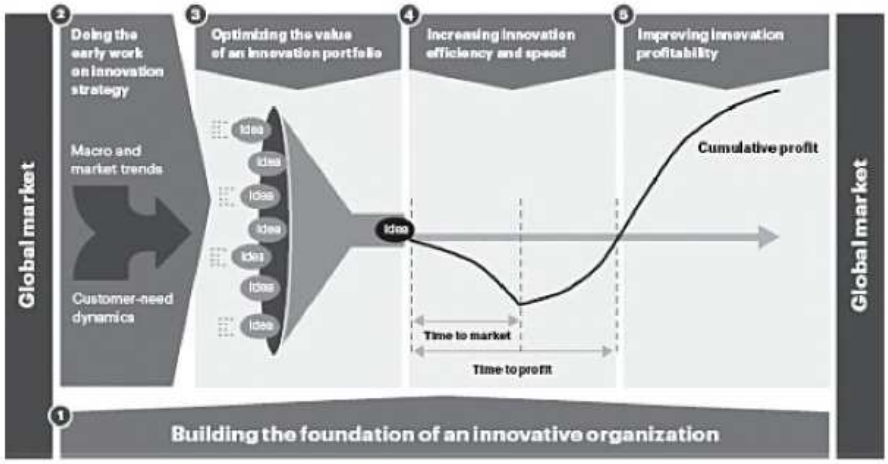

Figure 1: Areas for improving performance and sustain growth, source: Engel et. al (2015)

But what is an innovative organization? According to Engel et al. (2015) an innovative culture is culture as the shared values and behavior norms that guide not just what people do, but how they do it. They delineated factors for building the innovative culture (see figure 2).

Environment	*Values*: innovation is embedded in the operational principles
	Leadership: manager´s behavior supports innovation and demonstrates that innovation is a priority
	Recognition: innovations and innovators are recognized and rewarded
	Freedom: the company gives employees time and space for innovation
Mindset	*Creativity*: employees are open to new ideas and solve problems imaginatively
	Risk taking: taking appropriate risks is forested, and failures are learned from rather than punished
	Customer orientation: delighting the customer trough innovation and quality is a demonstrated obsession
Ways of working	*Collaboration*: cooperation defines work that takes place across functions and across locations
	Ownership: innovation is everyone´s job and can come from anywhere, within or outside the organization and its networks
	Openness: the company fights against "not-invented-here" syndrome, there is openness to and acceptance of external ideas and partners

Figure 2: Building an innovation culture: The elements you have to get right, source: Own elaboration based on Engel et al. (2015)

One of the element is "openness" – open innovation is a strategy or a concept of an access to the innovation. It allows the involvement of all employees and sometimes progresses beyond the boundaries of the organization – enables customer

engagement, the general public and the competing operators. Typically, it´s bound to crowdsourcing platform or open co-working centers that enable the sharing of ideas, resources, as well as risks.

According to Chesbrough (2006) the logic of Open Innovation is based on a landscape of abundant knowledge, which must be used readily if it is to provide value to the company that created it. The knowledge that a company uncovers in its research cannot be restricted to its internal pathways to market. Similarly, its internal pathways to market cannot necessarily be restricted to using the company´s internal knowledge. This perspective suggests some very different organizing principles for a research and for an innovation. Figure 3 shows some of these principles and contrasts them with the Closed Innovation.

Closed Innovation Principles	Open Innovation Principles
• the smart people in the company´s field work for the company	• not all the smart people work for the company, the company needs to work with smart people inside and outside the company
• to profit from R&D, the company must discover it, develop it and ship it itself	• external R&D can create significant value, internal R&D is needed to claim some portion of that value
• if the company discover it itself, the company will get it to market first	• the company doesn´t have to originate the research to profit from it
• the company that gets an innovation to market first will win	• building a better business model is better than getting to market first
• if the company create the most and the best ideas in the industry, the company will win	• if the company make the best use of internal and external ideas, the company will win
• the company should control its IP, so that the competitors don´t profit from the company´s ideas	• the company should profit from others´ use of the company´s IP and the company should buy others´ IP whenever it advances the company´s business model

Figure 3: Contrasting Principles of Closed and Open Innovation, source: Own elaboration based on Chesbrough (2006)

No company can expect its technology to remain fixed for very long time. It is far wiser to expect technology to change, sometimes is unpredictable ways, than it is to assume that the things will remain in their current state for a prolonged period. Companies that don´t innovate, die.

3. Open innovation in practice

Some companies are taking Open Innovation to a whole new level and involving communities to work together to solve complex problems or to help one another out with these dilemmas.

a. Hewlett Packard

Hewlett Packard is one company in particular that has really embraced the ideals of open innovation. It has developed labs where open innovation thrives. It has created an open innovation team that links collaborators that are researchers and entrepreneurs in business, government and academia, to come up with innovative solutions to hard problems with a goal of developing breakthrough technologies. For example, it works with universities in its "HP Labs Innovation Research Program" with a view to getting universities around the world to get involved in joint research with HP Lab Scientists. This is just one of the undertakings that HP is using to drive open innovation forward.

The office consists of a global team, bringing together expertise from around the world to foster discovery and address important issues, connecting the world's leading researchers, scientists and entrepreneurs through ground-breaking programs and collaborating with them to tackle the next generation of breakthrough technologies.

b. Philips Research

Philips Research is a global organization that helps Philips introduce meaningful innovations that improve people´s lives. They provide technology options for innovations in the area of health and well-being, targeted at both developed and surfacing markets.

Philips Research plays a significant role in bringing technology-enabled innovations to the Philips business sectors, but they don´t work in isolation. They work together with the companies that are complementary to Philips and share their vision. That is why they actively pursue what they call „Open Innovation" – sharing their expertise and technical abilities with universities, institutes and other companies so that. Together they can realizethe best ideas.

There are two kinds of Open Innovation:

- „inside-out" innovation – for making skills and resources available to the outside world (for example they regularly undertake contract research for external parties, provide technical facilities and support and assist with IP licensing),
- „outside-out" innovation – for drawing on the capacities of individuals, organizations and small start-ups from around the globe (by providing a broader window on the world of health and well-being, these strategic partners help them to gain new insights and access to new technologies).

Philips Research has decades of experience in both these approaches, but they are always looking for creative new sources of innovation. Building on their long-standing relationships with universities and technical institutes and on their experience in countless public-private partnerships, they are now experimenting with strategies like crowd-sourcing and social networking to come up with new technical solutions.

c. Starbucks

Starbucks has during the last fifteen years pioneered the field of open innovation. Opening up instead of locking up can provide real value with relatively small investments.

Starbucks has received 100 000 ideas so far from their customers. The number of workshops and focus groups Starbucks would need to host to generate so many ideas. Open Innovation is about bringing a group of people with a common goal together to collaborate. The Internet enables everybody to work together in larger groups than ever before.

Open Innovation opens up for inviting all members of a company to take part in the innovation process which will lead to different results than simply asking management or the R&D department. And innovating with the company´s partners, customers or competitors will almost certainly bring fresh perspectives compared to only innovating internally.

4. Process of open innovation

Methods of open innovation are increasing currently. It is one of possibilities how improve a company processes and gain competitive advantages. Employees of the companies personalize methods of open innovation to their companies. So it isn´t created whole methodic how used open innovation in companies. Every innovation is process of change, so it can be there some process how take a change. The process, modified to open innovation is shown like Figure 4.

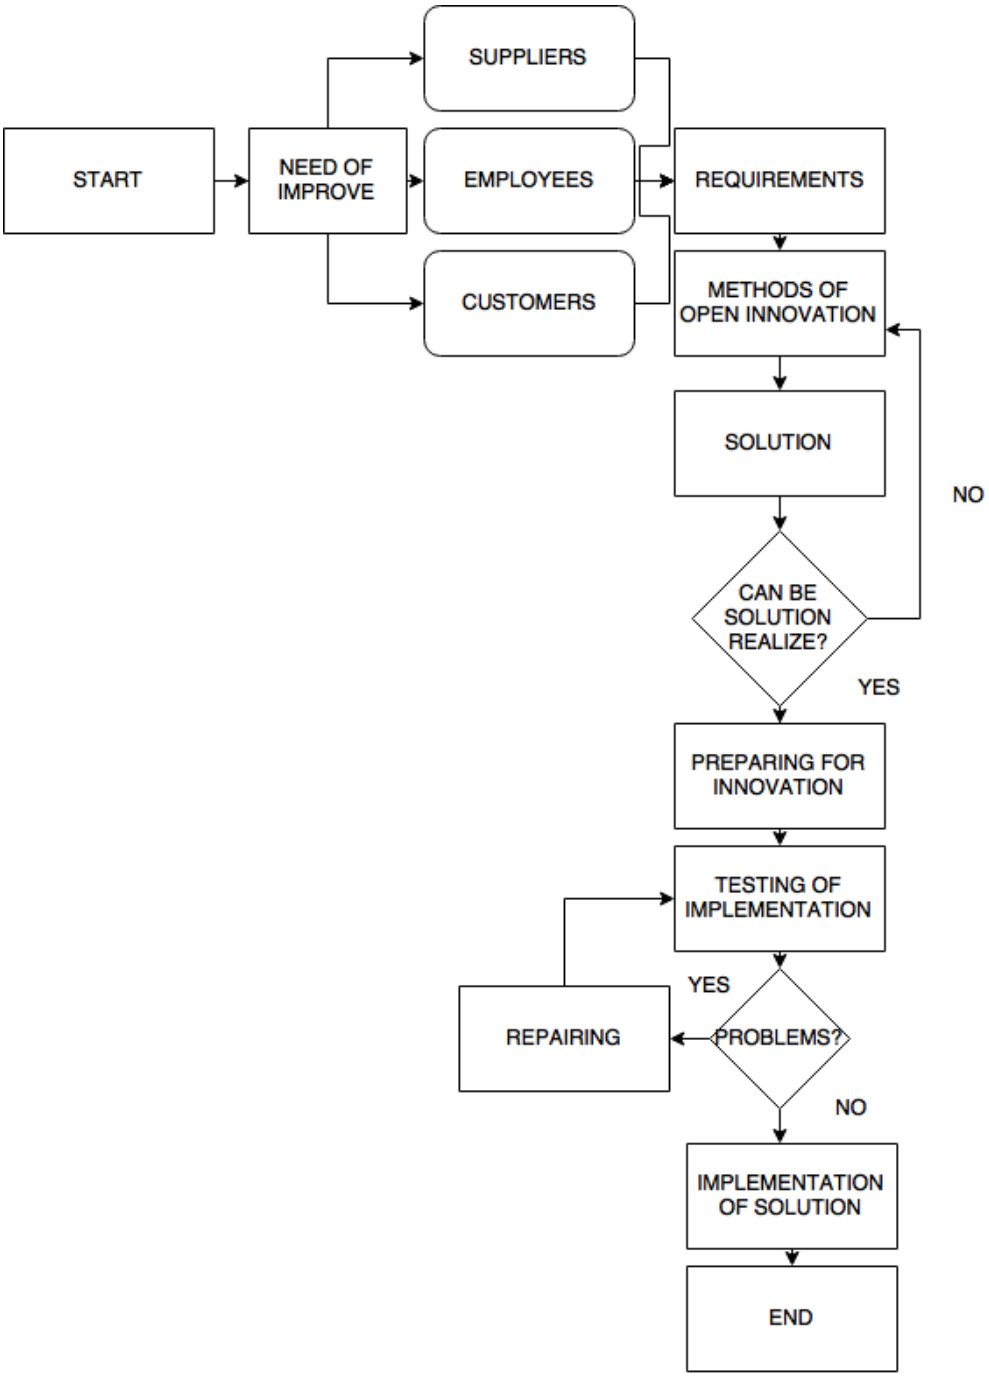

Figure 4: Process of implementation of open innovation, source: authors

Primary, the company musts want the change. The companies where are not improved processes regarding company will have problems with competition companies which innovate.

So firstly is available find out where the company has area for improving. One of possibilities is asking people which have daily contact with company. It means suppliers, employees and customers. These people can provide requirements for improving a company processes.

After this step is available apply methods of open innovation for finding out how improve requirement processes. It is many possibilities of open innovation which can be realize. For example, it can be brainstorming, brain writing and questionnaire research. The key part of open innovation is integration of all employees. This step can see point of view from other angles, because employees on other levels in the company have other opinions. Anonymous or public approve of opinion is individual (means it depends on a company culture and relationship between employees).

After applying methods of open innovation is necessary choose makeable opinions. This step eliminates most of opinions, because the person which decides which opinion is available musts consist other conditions also. Other conditions can be price of proposed solution, time period of applying of proposed solution or number of employees (eventually new employees) which will be retrained. Proposed solutions are eliminated and remained only solutions which are realizable. It is available write opinions which can´t be realize, because can be realize in the future.

Now control is available if the solution (eventually solutions) is really realizable. It is necessary find out if really is possible apply innovation in the company, if isn´t possible the solution must be returned to the proposal of opinions.

The company must be prepared for innovation. This step can´t be underestimated because without proposal steps of implementation of innovation and potential problems the problems will be occurred in the future and in the bigger measurement. Preparing for innovation means that must be planned step by step how will be innovation implemented. It is necessary provide information about innovation to the employees and delegate person (eventually team) who will be responsible of innovation. This person should solve the problems with implementation also.

Next step is testing of implementation. Methods how testing an implementation are many and every company used available method for them. Test of implementation usually detects problems. It is necessary repairs and dissolves problems before the whole implementation. After repairing and dissolving is available testing of implementation again. When the situation is appreciated follows whole implementation. It is available write documentation about implementation and problems with implementation. The documentation can be used for planning next innovation.

Implementation of solution is individual for every company. Firstly employees must be informed when the innovation will be implemented. When the implementation is processing it is necessary have available people who will be works like a “technical support”.

The people will should solve potential problems and eventually help people with change. After successful innovation is available write documentation about

implementation of innovation which can help preempt problems with implementation of next innovation.

5. Conclusion

Companies are institutions focused on profit and dominancy on the market. So companies must supply something better or extra to the customers than their competition. That means that their products must be improved and modified. Innovation is one of possibilities how a company can gain a competitive advantage. Methods of open innovation are increasing, because are applicate able for various company process.

Paper deals with universal process of implementation of open innovation, which can be modified for specified processes and companies or public institutions. Process covers all step how implement an innovation. Process of implementation can be extended or modified for specific situation in the company in the future.

The Prospects for the Implementation of Industrial Policy in Countries in tThe Medium Term

Olga Kryzhanovskaya, South-West State University, Kursk, Russia, morozikolya2008@yandex.ru
Larisa Sevriukova, South-West State University, Kursk, Russia, REandM@rambler.ru
Vladimir Plotnikov, Saint-Petersburg State University of Economics, Saint-Petersburg, Russia, South-West State University, Kursk, Russia, plotnikov_2000@mail.ru
Yulia Vertakova, Southwest State University, Kursk, Russia, vertakova7@ya.ru

Abstract

The article analyses the priorities of the state industrial policy of various countries of the world in the global crisis. The purpose of the study was to analyze worldwide trends of industrial development and the rationale for the development of this direction in the future. To achieve this goal was identified the share of industry in GDP of leading world countries, analyzed the volume of production in major industries. This allowed to prove that the problems in the economic sphere of some States to a large extent caused by the low level of industrial development. Was analyzed the dynamics of various global indices: Industrial Production Growth Rate, %, ISM Manufacturing Index, PMI Manufacturing Index, the commodity structure of exports and imports, the volume of foreign trade. For research were used official data from World Bank, World Factbook, UNIDO, EREPORT, Eurostat, the International auditing company PricewaterhouseCoopers (PwC), Rosstat, Central Bank of Russia, the Russian Centre for macroeconomic analysis and short-term forecasting. The research provided a forecast of the index of industrial production in 2016, and 2017, and forecast the ranking of countries in terms of GDP calculated at purchasing power parity (PPP) in constant prices of 2014, expressed in US dollars. The prediction results confirmed the author's hypothesis about the need for the development of industrial production in the long term to increase economic growth and achieve competitive advantages.

Keywords: industry, state industrial policy, industrial production

1. Introduction

The globalization of the economy objective. It seeks to improve productivity by forming a single world market of goods, services and capital, global information and communication systems, the standardization of cultural attitudes on a global scale. Globalization is an objective form of existence of the fundamental economic law of labor division, specialization and cooperation. Most clearly this economic law is manifested in the sphere of industrial production.
It should be noted the significant contribution to the study of problems of development of the industry by scholars such as J. Galbraith (2007), A. Marshall (1920), J. Hobson (2003), W.S. Jevons (1957), T.K. Henry (1848), H. Levi (2001), D. Kendrick (1979). Summarizing the results of their research can be concluded that the existence of different, sometimes contradictory concepts of industrial, post-industrial, informational, service, etc. the economy does not deny the systemic nature of industry in the economic development of the state. A significant contribution to the development of theoretical and practical aspects of regional industrial development of Russia, the theoretical foundations of the development and implementation of state industrial policy, improvement of management systems of industrial enterprises introduced Yu. Vertakova (2013, 2015), V. Plotnikov (2014), I. Risin (2016), Yu. Treshchevsky (2013) and other Researchers have noted that in the period do section restrictions almost half of Russian enterprises cooperated with foreign countries, indicating the high level of integration of the country's industry in the global economy. However, changing macroeconomic factors of development of industry in Russia is creating the need for harmonization of Russian and international institutional environment of doing business, the development of industry.

Despite the presence of numerous works devoted to the analysis of problems of development of the global industry, which plays an important role in the creation of GDP and the economy as a whole, the introduction of sanctions restrictions in light of recent world events has made a radical change in the economic environment for industrial enterprises in a number of countries. In this regard, the study aimed at identifying the priorities of the state industrial policy, the study and implementation of industrial policy measures to improve industrial development, require upgrading and updating.

The need for adaptation of economic entities of the industrial complex to the changing factors of the economic environment and changing forms of the state support of competitiveness of industrial production determined the choice of objectives and research. The purpose of the study is to identify global trends of development of the industry based on the analysis of the share of industry in GDP in leading countries, volume of production for major industries, as well as the dynamics of the various global indices, such as Industrial Production Growth Rate, ISM Manufacturing Index, PMI Manufacturing Index, commodity structure of export and import, foreign trade, in order to justify the development of this direction in the future given made of the forecasts of industrial production index and ranking of countries in terms of GDP calculated at purchasing power parity.

2.Materials and Methods

Theoretical and methodological basis of research consists of scientific works, devoted to the development of the industry, global trends in the regulation of industrial production, expansion and modification of industrial policy instruments, as well as applied research on the subject. In the process of the study were used General scientific methods of analysis and synthesis, comparative, analytical methods, and statistical treatment of information, techniques and tools of logical analysis.

In this study, the authors collected and processed historical data for the development of industrial production in various countries around the world. By analyzing the data, it was identified the share of industry in GDP of leading world countries, as well as analyzed production volume by main sector of industry on the basis of official statistical data.

To achieve the objectives of the study the authors analyzed the dynamics of world stock indices:

• Industrial Production Growth Rate, %: compares the annual percentage increase in industrial production (includes manufacturing, mining, and construction)/

• ISM Manufacturing Index: is an index based on surveys of more than 300 manufacturing firms by the Institute of Supply Management. The ISM Manufacturing Index monitors employment, production inventories, new orders and supplier deliveries. A composite diffusion index is created that monitors conditions in national manufacturing based on the data from these surveys.

• PMI Manufacturing Index: is an indicator of the economic health of the manufacturing sector. The PMI index is based on five major indicators: new orders, inventory levels, production, supplier deliveries and the employment environment.

• Commodity structure of exports and imports: is the distribution of exports and imports by major commodity positions.

• Foreign trade: measured in monetary terms, the economic indicators of foreign trade of the country, group of countries or administrative-territorial unit (region) for a certain period of time: month, quarter, year.

For processing of the initial information used in this work such methods as structural, functional, economic-statistical financial and strategic analysis, as well as Excel software.

3. Results and Discussion

Industrial production is one of the strategic economic activities. The evolution of modern human civilization, first of all, technocratic, it is based on continuous improvement techniques and industrial technologies (formerly craft and manufacture) production.

Even though today many scholars proclaimed the idea of formation of a postindustrial society, as evidenced by the statistics (see Table 1), where industry played a minor role, we do not agree with this opinion.

Table 1: GDP - composition, by sector of origin (%), 2015

	World	Russia	European Union	United States
agriculture	6.5	4.4	1.6	1.6
industry	31.1	35.8	24.3	20.8

services	62.4	59.7	71.2	77.6

Source: http://www.indexmundi.com/world/gdp_composition_by_sector.html

Despite the emergence of the concepts of post-industrial, informational, service, etc. of the economy, industry in the modern economic system still plays a constitutive role. It is evident from the relatively "painless" passage of the lowest point of the last global crisis the economies of countries with developed industry (Germany, China, etc.). Further confirmation of the necessity of industrial development is the experience postcyclone (2014) development of Russia. As you know, after the introduction against Russia economic sanctions became topical problems of development of national import substitution industries. But without a modern industrial base, these tasks proved problematic.

Experience shows that without a developed industrial production is not achieved the required level of stability of the national socio-economic system. This clearly showed a decline in the share of industrial production in GDP of countries in post-crisis periods (2008 and 2015) (Fig. 1).

Fig. 2. Industry, value added (% of GDP) (EU-28)

Problems in the economic sphere, Greece, Cyprus and Malta, in our opinion, to a large extent caused by the low level of industrial development (table. 2).

In our view, the rising share of services in GDP of Russia and developed Western countries due to different reasons. If in developed countries (USA, UK, Netherlands, France, etc.) the main reason for this structure of the economy – rising standard of living and therefore the expansion needs to meet which is formed more and more developed structure of services sector in our country and acted by another factor. In 1990-ies was the start of a radical reorganization of the economic system of the country. Among the implications of the transition to a market economy was a very serious decline in the sectors of material production – industry, agriculture. As a result, some industrial production, for example, garments, shoes, machine tools with numerical control, some types of electronic devices virtually ceased to exist.

Table 2: Production volume by main sector, Greece, Cyprus, 2014

	Greece	Cyprus
Food and beverages	15	1
Textiles	2	0
Wearing apparel, fur	8	0
Leather, leather products and footwear	1	0
Wood products (excl. furniture)	5	1
Paper and paper products	1	0
Printing and publishing	3	0

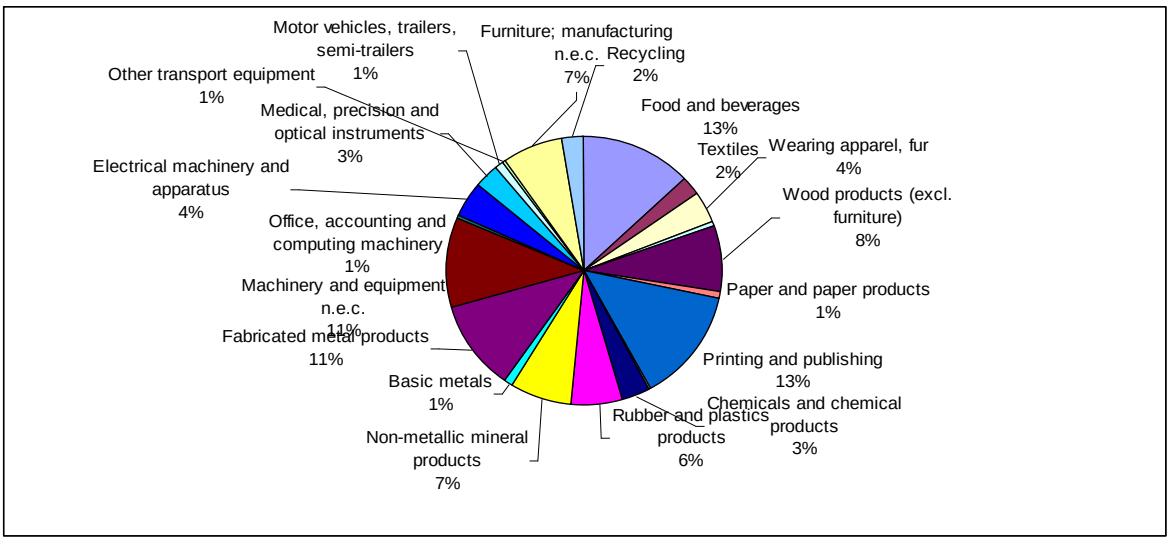
Rubber and plastics products	1	0
Non-metallic mineral products	4	0
Basic metals	1	0
Fabricated metal products	10	1
Machinery and equipment n.e.c.	5	0
Electrical machinery and apparatus	1	0
Furniture; manufacturing n.e.c.	7	1
Total manufacturing, millions	65	5

Compiled by the author based on http://stat.unido.org/home

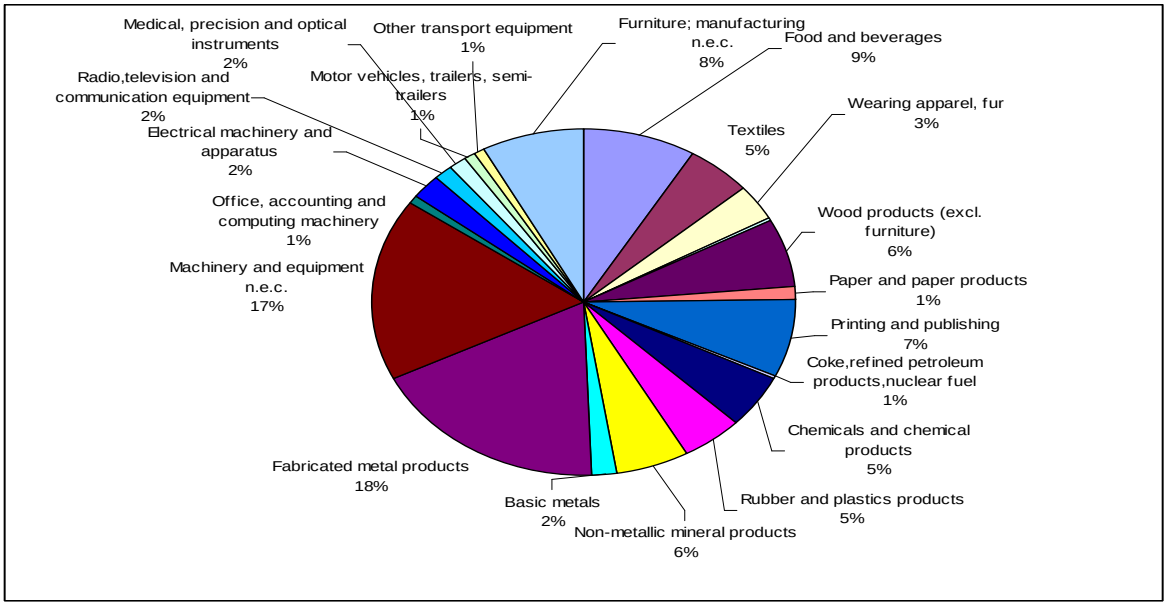
Against this background, the decline in the production of many services, especially oriented to the needs of the population (trade, housing and communal services, public catering, public transport, etc.) were much less significant. As a result, in the structure of GDP the share of services grew. In the end, the Russian economy is facing a structural situation similar to that available, say, in the US economy. But the underlying causes of these situations differ significantly. The Russian economy simply deindustrializers under the influence introduced by inefficient actions of the government shock, and not due to the internal logic of its evolution.

Shares of industries in total production of Russia and the USA are presented in figures 3 and 4.



Compiled by the authors based on http://stat.unido.org/home

Fig. 3. Share of industry in total production, Russia, 2014, %



Compiled by the authors based on http://stat.unido.org/home

Fig. 4. Shares of industries in total production, USA, 2014, %

As can be seen from figure 5, in the acute phase of the crisis (2009) industrial production in Russia and in the world experienced the greatest compression. Its share in GDP had fallen to 27.5%. If you consider that GDP itself has fallen by almost 10%, the decline in production volumes as the industry looks very substantial.

Source: http://www.ereport.ru

Fig. 5. Increase in production in the world, %

Should stop at pre-crisis gradual decrease in industrial production. There are a variety of causes. A key reason, in our opinion, is inadequate to the tasks of economic development of the country's financial and economic policies that are implemented by the Central Bank of Russia and supported by the Ministry of Finance. Will stop on its quantitative characteristics.

According to the data obtained by the authors on the official website of the Central Bank of Russia (http://www.cbr.ru), the index (growth rate) real effective exchange rate of the ruble to foreign currencies (December to December of the previous year) was changed as follows: 2004 – 4.7%, and 2005 to 10.5% in 2006 to 7.4%, 2007: 4.6%, 2008 – 4,3%, 2009 – (-3,9%), 2010 and 6.9% in 2011 to 3.8% in 2012 to 3.8%, 2013 (last used us data – November) – (1.9 per cent). In the calculation of this index (the basket of foreign currencies) are accounted for by two factors: first, the dynamics of domestic (ruble) inflation, secondly, the dynamics of the nominal exchange rate of the ruble. What we have in the end: real ruble strengthened during the period by 47.2%.

That is, the price competitiveness of Russian industrial products in less than 10 years "efforts" of Russian monetary authorities was reduced by half. In these conditions, the industry continued to operate, supplying products to the domestic and foreign market, and among the industrial enterprises of many profitable – makes only admire the level of efficiency of management of domestic enterprises. Naturally, the "margin of safety" of industrial production is not unlimited. Therefore, the observed decay (see Fig. 5) looks quite natural result of the carried out in Russia in recent years macroeconomic policy.

According to the Center for macroeconomic analysis and short-term forecasting in early 2015, the us economy demonstrates the prerequisites for accelerating growth, despite the weakness of the industrial sector: the unemployment rate fell in January to 4.9% of the economically active population with 5.0% of the economically active population (seven years minimum) on the background of growth of the share of the economically active population to 62.7%, 62.6%, the rate of job creation was 151 thousand/month after 262 thousand/month in December, the consumer confidence index University of Michigan in January was after 92.0 92.6 in December, the index of purchasing managers in the manufacturing sector ISM Mfg in January was 48.2 (in December recorded the 48.0 level, at least since 2009) and is below the 50 level that separates expectations of expansion and contraction.

A number of indicators of development of the European zone indicates slow growth in the first half of 2016: an Increase of 1.1% in industrial production in the Euro area in November 2015, compared with November 2014, due to growth in the production of semi-finished products by 2.1%, consumer durables by 1.7%, and capital goods and consumer nondurable goods - 1.2%, while energy decreased by 2.8%. In the EU-28 increased by 1.4% was due to increased production of capital goods by 2.0%, intermediate goods by 1.8%, consumer durables by 1.7% and consumer goods nondurable 0.8%, while energy fell by 1.2 %. Among member States for which data are available, the largest increase in industrial production were registered in Ireland (+14.2 percent), Slovakia (+11.9 per cent) and Hungary (+7.1 per cent), while the largest decline in the Netherlands (-8,0%) and Estonia (is 6.2%).

The analysis of dynamics of indexes of production (Fig. 6) shows negative trends in the development industry.

Fig. 6. PMI Manufacturing Index

Analysis of the structure of production in Russia industrial production in the dynamics indicates a negative trend. It is interesting to note that the production of primary energy and electric energy in the country remains virtually unchanged. Thus, the volume of gas production practically does not decrease, oil production in recent years has slightly increased, coal mining decreased, which is probably connected with the fall in the consumption of this fuel and the drop in world prices.

The presence of a significant number of utilized sources of raw energy materials resources allows Russia to maintain exports at a high level and practically does not change its dynamics (a drop in the value of exports in 2014 may be related to negative for Russia, the exchange rate dynamics of the ruble against world currencies, as well as lower prices in world markets export of Russian goods). Collinear with the export dynamics is demonstrated and imports of goods (Fig. 7). It should be noted that significant changes in volume indices of external trade does not occur (Fig. 8).

Fig. 8. Foreign trade of Russia in 2000-2014

The data, according to the authors, confirm the availability and the need for a government decision on the implementation of the import substitution strategy.

Analysis of foreign trade shows that the basis of the Russian export flows is the implementation of fuel and energy resources in the world market. This situation, in conditions of extended periods of high world prices for oil and gas, canned technological development of the Russian economy. The innovative process has stalled. Today, when the global environment is the basic export goods of Russia is unfavorable, a transition to the production and use of its products can be considered the most important task in Russia's economy, which entered into force Federal law of the Russian Federation dated 31 December 2014 No. 488-FZ "On industrial policy in the Russian Federation".

The Ministry of Economic Development of the Russian Federation has made the Forecast of social and economic development of the Russian Federation for 2015 and on planning period of 2016-2017 in which it is noted that on development of industrial production significant effect will be had a foreign policy situation and entered concerning the Russian economy of sanctions from the USA and the European Union. At the same time the low level of processes of technological updating and insufficient competitiveness of a domestic production on internal and foreign markets remains the basic reason of the contained growth of the industry of the Russian Federation.

Table 3: Indexes of industrial production in 2013 - 2017, %, Russia

Name	2013	2014	2015		2016		2017		2017 to 2013, %	
			forecast							
			1	2	1	2	1	2	1	2

Production and distribution of the electric power, gas and water	97,5	99,4	100,6	101,3	100,9	101,4	101,2	101,6	102,1	103,7

Source:http://economy.gov.ru/

In the medium term, the development of the industrial complex will be determined mainly by the dynamics of domestic demand. At this rate of growth will be due to the implementation of complex system of measures aimed at improving the competitiveness of domestic producers and import substitution in sectors of the economy.

Summarizing the reasoning is legitimate to conclude that today's problems can be solved, and the capacity can be used due to the methodology of accelerated industrial development.

The international auditing company PricewaterhouseCoopers (PwC) presented the results of a new global Outlook for the world economy in 2015 and economic growth of leading countries by 2050. According to the data given in the report, the center of gravity of the global economy moves towards countries with emerging economies. The study presents long-term forecasts of potential GDP growth up to 2050 for 32 of the largest countries in the world, which accounted for 84% of global GDP. The authors concluded that over the next 35 years the world economy will continue the realignment of powers – the industrialized countries of North America, Western Europe and Japan hold the leading positions.

Table 4 shows the ranking of countries according to GDP according to the forecast of PwC.

Table 4: Predicted ranking of countries in terms of GDP calculated at purchasing power parity (PPP), in constant prices of 2014, expressed in US dollars

	2014		2030		2050	
Place at PPP	Country	Country Forecast GDP at PPP, US $ in 2014 prices	Country	Country Forecast GDP at PPP, US $ in 2014 prices	Country	Country Forecast GDP at PPP, US $ in 2014 prices
1	China	17 632	China	36 112	China	61 079
2	United States of America	17 416	United States of America	25 451	India	42 205
3	India	7 277	India	17 138	United States of America	41 384
4	Japon	4 788	Japon	6 006	Indonesia	12 210
5	Germany	3 621	Indonesia	5 486	Brasil	9 164

9	Indonesia	2 554	Mexico	3 985	Nigeria	7 345
10	UK	2 435	UK	3 586	Germany	6 338

Source: http://gtmarket.ru/news/2015/02/11/7089

Presented forecast figures GDP at market exchange rates without adjustment of relative prices. By this calculation, China will overtake the US in around 2028, while India clearly takes the third place in the ranking of the largest economies in the world in 2050, slightly behind the US.

Conclusions

On the basis of this study we have provided a few General recommendations:

• Given the economic problems in combination with institutional weaknesses, it can be assumed that to increase the pace of industrial growth will be difficult.

• You must thoroughly analyze the strengths and weaknesses of the institutional system as countries with developing market economy are very different from each other from the point of view of institutional development. There may be large differences in the level of institutional development among the economic sectors of a country.

• Developed markets countries in North America and Europe will continue to play a very significant role in the global economy in the coming decades, even if their average growth rate will be around 2%.

Thus, Europe should strive to improve your results as a result of the changes in the balance of power in the world economy. These changes returned to a situation in which the leading role in the world economy belonged to the Asian region. Last time such situation was observed before the industrial revolution. Thus, there is a very close

correlation between the growth rates of industrial production and the level of development of States. The data shows that on the foreground there will be those countries that will be able to increase the share of industry in GDP.

Acknowledgment

The study was performed as part of the state order of the Ministry of Education and Science of the Russian Federation No 26.2671.2014 "Theoretical and methodological foundations of development and implementation of cluster policy at regional level and scientific-methodical substantiation instruments of progressive structural transformations of the regional socio-economic systems".

Recruitment Methods for Students

Jakub Jirasko, University of West Bohemia, Pilsen, Czech Republic, jirasko3@kks.zcu.cz
Martin Hynek, University of West Bohemia, Pilsen, Czech Republic, hynek@kks.zcu.cz
Simon Pusman, University of West Bohemia, Pilsen, Czech Republic, pusmans@kks.zcu.cz

Abstract

This paper describes the methods used by the University of West Bohemia (UWB) for recruiting students to the Faculty of Mechanical Engineering (FME). Developments in the Czech educational system over the past two decades are also summarized.

The methods used to inform the general public about the possibilities of studying at FME and provide news in the field of science and the new technologies being developed at FME are described in this article. Information is given about activities organised by the Faculty for the general public and specialized events directed towards a closed number of potential students. New e-learning study materials created at UWB at FME are mentioned in this paper. These study materials contribute to increasing the interest in study at FME and assist in keeping students motivated during their studies.

Keywords: Recruitment Methods, Mechanical Engineering, Machine Design, E-learning

Introduction

The higher education system in the Czech Republic has changed significantly over the last twenty years. The universities, which were previously available for only a small percentage of the population, have become more open for a wide range of applicants. Combined with positive demographic growth, it has led to an increase in the number of students. In spite of this, a suitable number of students in engineering fields has not been attained. “Since the mid 1970s most “developed” countries have measured the “success” of universities on their capacity to produce skilled staff, professional workers, technical experts and lately flexible entrepreneurs for the economy“ (Kapranos, 2012).

The predicted decrease in the number of students is starting. It is important to place high demands on human resources management to ensure a suitable number of students. It is necessary to support and develop recruitment methods in the competitive environment of other universities. These methods stimulate interest in engineering study and help motivate students to study at FME.

Development of Higher Education in the Czech Republic

The proportion of students who completed high school and continued in higher education was only 20% in the first half of the nineties. The high level of competition among students resulted in the high quality of students enrolled at universities. Universities did not have to stimulate a large interest in the small number of vacancies at universities by using special recruitment methods. Significant changes to this state happened at the end of the nineties. The new laws adopted in 1998 took particularly into consideration the higher education system. The full master’s degree programme which had lasted five years was divided into two separate programmes. These programmes were the bachelor´s degree programme (3-4 years) and the master´s degree programme (2-3 years). The system of financial support was also changed. The budgets have become more reliant on the number of enrolled students. The amount of money received by the university increases with the number of enrolled students. The proportion of students who completed high school and continued in higher education changed distinctly between 2000-2010. It increased from 20% to 65%. An elite higher education system was transformed into a universal education system over just one decade.

“Elite higher education is concerned primarily with shaping the mind and character of the ruling class, as it prepares students for broad elite roles in government and the learned professions. In mass higher education, the institutions are still preparing elites, but a much broader range of elites that includes the leading strata of all the technical and economic organizations of the society. And the

emphasis shifts from the shaping of character to the transmission of skills for more specific technical elite roles. In institutions marked by universal access there is concern for the first time with the preparation of large numbers for life in an advanced industrial society; they are training not primarily elites, either broad or narrow, but the whole population, and their chief concern is to maximize the adaptability of that population to a society whose chief characteristic is rapid social and technological change" (Trow, 1973).

Growth continued until 2010, when the number of enrolled students peaked.

Since 2010 it has slightly decreased. This state was predicted, and is caused by demographic trends. Universities have used more aggressive recruitment methods to ensure a sufficient number of students. Limits in the number of enrolled students were adopted in 2011 to prevent universities from taking in less talented students. The financial structure of universities was also adjusted. Special attention was given to the quality of teaching and the cost of the study programmes. These facts led to a decrease in the number of students in higher education.

It is possible to predict a continuation of this trend, especially in technical departments. One of the main aims for the successful future development of the Pilsen region is to ensure a sufficient number of students in engineering studies. FME is increasing its activities focusing on the positive presentation of the Faculty and motivating potential students.

Current State at UWB at FME

The UWB in Pilsen has adjusted its study programmes in accordance with the trend in the number of students. The advancement of education is supported by the University. Over 13 thousand students are enrolled. They can choose from 201 study programmes. The development is particularly significant in the technical departments. Four new research centres have been established. The demand for an educated, flexible and skilled workforce increased after these research centres were opened.

FME currently has to fulfil the requirements of traditional industrial companies and also prepare students to work in new research centres. Enrolling a sufficient number of students is necessary.

A strong competitive environment is developing between the faculties. FME is focused on developments in human resources management.

Recruitment Methods at UWB at FME

FME is one of several technical faculties at UWB. It works with potential students in a similar way to the other faculties. A variety of different methods for recruiting new students are in use at FME. These methods aim to:

- Inform the general public about FME
- Inform potential applicants about opportunities at FME
- Offer interesting study programmes, fellowship programmes, etc.
- Motivate potential applicants to visit the faculty during open day events
- Motivate students to learning especially at the beginning of study

Public Perceptions

Engaging the general public is one of the main aims. Events are organised throughout the whole year. Some of these bring science to life, on the street. The Science and Technology Week is the most popular science festival in the Czech Republic, and all the technical faculties at UWB participate in it. For example see Fig. 1. The employees and students demonstrate the latest trends in science and present their research projects. Visitors can choose between professional science workshops or shows aimed at young people and less demanding audiences. Events are popular among young visitors. This is one way for the Faculty to capture the attention of children and teenagers. It is a perfect advertisement for FME and the other technical faculties.

Making presentations at high schools is another recruitment strategy. Scientists from FME visit high schools and provide information about studying at FME. They make presentations about the advantages of studying at a technical faculty. Students are often interested in employability in the labour market after graduation. A wide range of study programmes is important for them too.

A Faculty Open Day is also organised for applicants. It is a perfect opportunity for high school students to find out particular information about the Faculty. Visitors go through each department at the Faculty and have a chance to see scientists at work and students studying.

All these recruitment strategies are organized like face to face meetings.

Communication with the media

Communication with the media is another method for attracting the attention of the general public. TV radio reports give news about science and new technologies. The media are interested in new inventions and unconventional technologies. The attention of the media is currently aimed at electromobility and electric motorcycles at FME. For example see Fig. 2.The media are able to give information to many people in a short time. This is the main advantage of the media.

Getting positive media attention brings an increase in the number of applicants and it makes the Faculty more attractive to sponsors.

Fig. 1 The Science and Technology Week (Kolarova, 2015)

Fig. 2 Photo of motorbike from university websites (Kolarova, 2015)

Advanced E-learning Study Materials

Providing interesting study materials has the potential to interest new applicants. The new e-learning study materials created at UWB at FME are not only attractive for existing students but also for potential applicants. These are available for free download from the Faculty website. Materials are created in 3D PDF format, which makes them widely accessible. The new study materials consist of real design projects which have been adapted and reworked for study purposes.

"All e-learning materials are available to all students and academic staff at the Faculty of Mechanical Engineering at the University of West Bohemia in Pilsen. They can be used for studying and also for teaching. The teaching subjects will be enriched by valuable know-how and academics will be able to explain the theoretical foundations of the projects in practice. Thus they will be able to teach students the importance and meaning of the given information" (Muller, Max, 2015).

Study materials provide information about machine design and production tools.

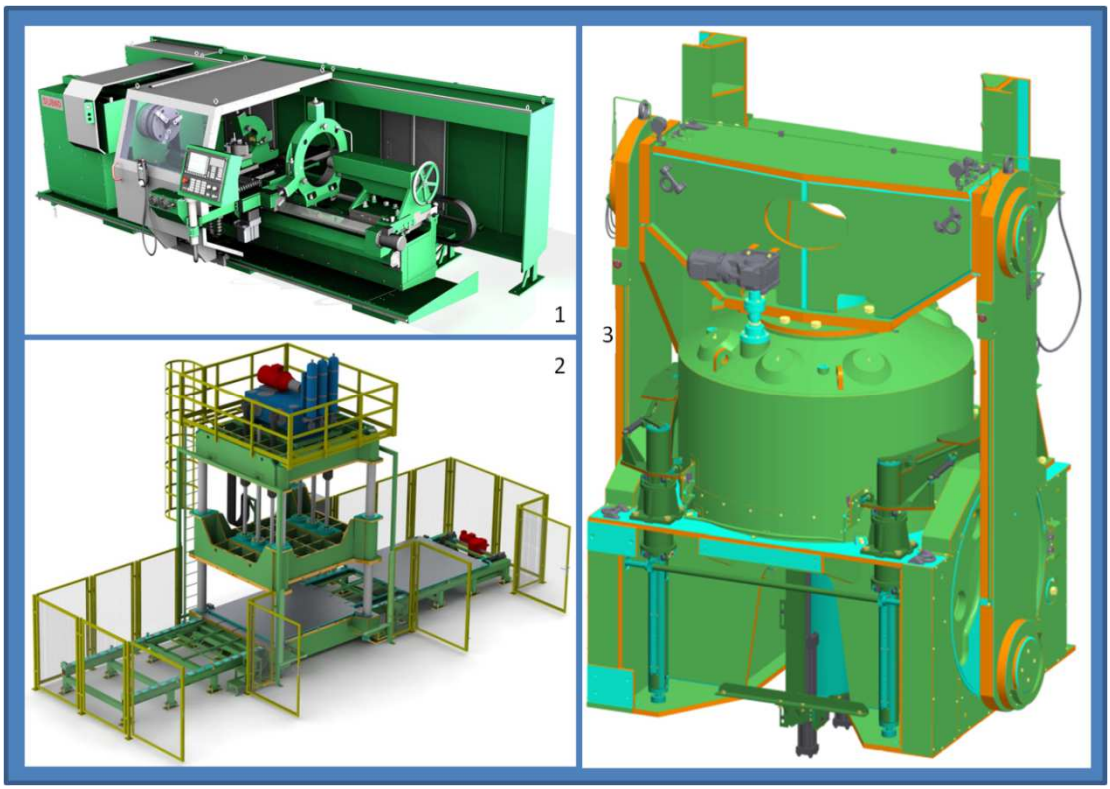

Fig. 3 Examples of design projects (Jirasko et al., 2015)

Conclusion

The developments in the Czech higher educational system have been described in this paper. An elite higher education system has been transformed into a universal educational system over the last two decades. Universities have become more open to a wide range of potential students. Laws adopted at the end of the nineties in the Czech Republic have brought about these changes. The swift growth in the number of students continuing in higher education after high school has created a new situation for universities. Universities have to attract student applicants. Technical faculties in particular have not been able to ensure a sufficient number of students.

This has led FME at UWB to use a variety of recruitment methods. The Faculty cooperates in events aimed at the general public. FME is one of the technical faculties engaged in the Science and Technology Week, the most popular science festival in the country. The Faculty places great emphasis on communication with the media. Positive advertising created by the media has the potential to make technical studies more popular among students. New e-learning study materials which can increase the interest of students have been created. These materials are available for free download from the Faculty website.

The recruitment methods described in this paper help to ensure a sufficient number of engineering students, and eventually qualified graduates, who are necessary for the future development of the Pilsen region.

Students' Attitudes toward Problem-Based Learning – Analog Electronic Course in the Electrical Engineering Programs in PPU: A Case Study

Abdallah M. Arman, Palestine Polytechnic University, Hebron, Palestine, armana@ppu.edu

Abstract

In Palestine there is a growing recognition for innovative teaching and learning approaches such as Problem-Based Learning (PBL) in engineering education in order to develop competence graduates. According to Kitogo (2011), “today’s graduates have attractive curricula vitae, but practically, their performance is insufficient; it doesn’t match with what they claim to have studied. The researcher sees that people learn when being actively involved in constructing meaning. In other terms, successful learning requires individuals' active participation and involvement. PBL as a dynamic approach to teaching in which students explore real-world problems, issues and challenges, are inspired to obtain a deeper knowledge of the subjects they are studying and more likely to retain the knowledge gained through this approach far more readily than through traditional textbook centered. This principle agrees the Chinese saying *"Tell me and I forget, show me and I remember, involve me and I learn".*

This article presents a survey about the usage and the attitudes toward education technology at PPU in Palestine. The survey aims at assessing the experience, skills and computer efficacy of students, measuring their attitudes towards the use of education technology and distinguishing obstacles for the development of a co-operative learning environment. The results indicate positive attitudes of students toward this new approach of learning. The survey is used for the development of the university teaching and learning strategies, providing information on how to establish systems and procedures that enable the effective use of an PBL approach.

Keywords: Problem-Based Learning, Features, Analog Electronics, Students’ Attitudes.

Introduction

No one can deny that advances in information technology coupled with the changes in society, are creating new paradigms for education and training. These changes will affect our education and training systems. Participants in this educational and training paradigm, require rich learning environment supported by well-designed resources (Khan, 1997). Therefore, there is a great demand for affordable, efficient, easily accessible, open, flexible, learner- centered and facilitated learning environment. One of the approaches which reflects the principles of learner- centeredness is Problem–Based Learning (PBL).The theoretical foundation of Problem-based learning is strongly grounded in constructivism. In this regard, Railsback (2002: 6) maintains that "Problem - based instruction strategies have their roots in the constructivist approach". Moreover, PBL borrows its principles from pragmatic constructivism, cognitive constructivism and social constructivism, which constitute the main stands of the constructivist learning theory. In other terms, it commonly includes the ideas of Dewey's philosophy, Piaget's cognitive theory, and Vygotsky's social constructivist theory.

I believe that since PBL is potentially Motivating, empowering and challenging to learners, it usually results in building learners’ confidence, self-esteem, and autonomy as well as improving students’ language skills, content learning, and cognitive abilities, so learning becomes fruitful for learners because they exhibit their abilities to plan, manage, and accomplish projects through their content knowledge and skills " Problem -based learning is an instructional method centered on the learner as assured by (Erdem, 2012; Harris & Katz, 2001) "Instead of using a rigid lesson plan that directs a learner down a specific path of learning outcomes or objectives, project-based learning allows in-depth investigation of a topic. "Problem-based learning is a comprehensive approach to classroom

teaching and learning that is designed to engage students in investigation of complex, authentic problems and carefully designed products and tasks (Blumenfeld, et al. 1991; Demirhan, 2002).

Problem-based learning (PBL) is still in the developmental stage. There is not sufficient research or empirical data to be able to state with certainty that problem-based learning is a proven alternative to other forms of learning, especially in the Arab countries. Based on evidence gathered over the past years, problem-based learning appears to be an effective model for producing gains in academic achievement. However, only a few of them have focused on problem-based learning in Electrical Engineering. Analogue electronic components and circuits are building blocks for any electronic device used in industries or in daily life. It is therefore necessary for electronics engineers to understand clearly the principles and functioning of the basic analogue components and circuits. This course will enable the students to understand the basics of construction, working, and applications of various types of electronic components such as Diodes, BJT, JFET, MOSJFET and circuits such as Small Signal amplifier, oscillators, power amplifiers, operational amplifier, and timers using linear ICs. Practical exercises of this course would enable students to maintain such circuits and in turn maintain equipment having such circuits. This course is therefore one of the basic core courses which is must for every electronic engineer and hence should be taken very sincerely by students.

The need for this study arises from three main things: the personal experience of the researcher in teaching field, the literature review on problem-based approach and the roles of the teacher and real needs of teachers of Electronics. First, the researcher noticed that students' achievement level in Electronics courses is decreasing as they practice learning Electronics almost only inside the class or to study for the exams. As a result, the researcher tried to find a useful strategy to facilitate learning Electronics. Second, having reviewed the current literature, the researcher has figured out that the field of Electronics teaching and learning is poor in studies concerning the roles of the teacher and learners in light of the problem-based learning approach to teaching Electronics in Arab countries. Third, the unexpected low rate of success in these courses is a problem which deserves to be studied.

Eagly and Chaiken (1993) define attitude as "a psychological tendency that is expressed by evaluating a particular entity with some degree of favor or disfavor ". In problem-based learning (PBL) activities students work in a group to solve challenging problems which are authentic; students create an end product through intellectual inquiry and involving meaningful tasks. Moreover, because project work activities address the different learning styles of students, Problem-based learning takes individual differences into consideration by giving students a chance to select their own topics. Therefore, PBL is not a new method and it has connection with many old approaches as their contributions to concepts such as action-based learning, learning by doing, group dynamics and interpersonal communication have been instrumental in shaping many theories of learning and teaching, and when combined together, reveal the bare bones of PBL.

Student attitudes are considerably related to motivation and success. Having high skills and talents is not enough for students to complete a task successfully and to make them like an activity as they are doing it. In order to sustain students' motivation, a positive opinion about the learning task and an internal stimulus is needed. Attitudes and beliefs are accepted as the pioneers of behavioral objectives. The probability of having willingness about learning tasks and sustainability of efforts is higher in students with a positive attitude. It is believed that a positive attitude toward science classes is directly proportional to success. Therefore, it is important to find answers to questions asking what can be done to increase student interest toward science classes and to turn science classrooms into more enjoyable places. This study also aims to identify the effect of PBL on the attitudes of 3rd-year undergraduate students toward Electronics.

Problem Based vs. Traditional Instruction

PBL is generally less structured than traditional, teacher-led classroom activities; in a problem-based class, students often must organize their own work and manage their own time. Within the problem-based learning framework students collaborate, working together to make sense of what is going on. Problem-based instruction differs from inquiry-based activity by its emphasis on collaborative

learning. Additionally, Problem-based instruction differs from traditional inquiry by its emphasis on students' own artifact construction to represent what is being learned.

Both traditional and problem-based instruction may have the same course goals, objectives, and outcomes. Both have the same dilemma of getting students to learn the “need to know material” in a restricted time frame. Yet, there are several ways to distinguish between Traditional Instruction and PBL as tabulated in table 1:

Table 1: Differences between Traditional Instruction and PBL

PBL	Traditional
Student-centered, students help each other and teacher just facilitates the learning Problem based and independent learning	Teacher-Centered and teacher responsible for the learning Problem solving and dependent learning
Constructing individual's knowledge through searching solutions for real life problem	Transmitting knowledge to a group through lectures
Focusing on understanding of content and integrate previous knowledge	Focusing on memorization of material
Deep and active Learning	Surface learning
Group Learning	Individual learning
Performance-based assessment	Traditional Assessment

Advantages of Problem-Based Learning

The problem-based approach can be applied in almost all areas of curriculum as it is useful because:

1- Projects have a ‘real world’ orientation and promote meaningful learning by connecting new information to students’ past experiences and prior knowledge.

2- Students learn valuable processes and skills for gathering and analyzing data.

3- Students are responsible for their own learning, thus increasing self-direction and motivation.

4- The learning process encourages various modes of communication and representation.

5- The approach encourages use of higher-order thinking as well as acquisition of facts.

6- The approach develops deeper knowledge of subject matter.

7- The approach also increases team-working and cooperative learning skills.

Methodology

Attitude is an internal state that influences student's choices or decisions to act under certain conditions. Attitudes represent a tendency to respond in a particular way. In order to find out the students’ attitudes toward the PBL approach, I have designed a 30 term questionnaire. The questionnaire shown in appendix (1) contains terms concerning:

- Using Computer and Internet in Education

- Cooperative Learning Style
- Self-Directed Learning
- Practical Skills in Electronics

The Likert technique was used. The technique presents a set of attitudes statements. Students are asked to express agreement or disagreement of a five-point scale. Each degree of agreement is given a numerical value from one to five. Thus a total numerical value can be calculated from all the responses i.e. the final score for the respondent on the scale is the sum of their ratings for all the items. In the case of reversal items the scale will be reversed.

Also, the questionnaire includes data questions about gender and it includes information about ownership of PC and Internet access.

To ensure content validity, the questionnaire was checked out by an expert in the field of education and for validity test it was run on a group of students whose attitudes are known and the result is positive ensuring questionnaire validity.

Analysis of Students' Attitudes toward PBL:

The analysis of terms for the attitudes of students toward PBL was carried out using the five-point Likert scale consisting of (1) strongly disagree, (2) disagree, (3) Neutral, (4) agree, (5) strongly agree was used in the items that measure attitudes. For statistical analysis, the descriptive procedures in SPSS (version 15) were used. The Cronbach's Alpha equals 0.731 which is suitable for the research. The results are shown in the tables in the appendix (2).

Results

Computer Infrastructure

From (Table 3), all students have access to a privately owned PC they can use for their studies.

Internet Access

From (Table 4), all students have access to the Internet via ADSL.

Using Computer and Internet in Education:

From (Table 5), most of the students are familiar with office applications and they enjoy using computer daily to perform educational tasks, and most of them agree that computer should play more important roles in Engineering education (item2, with mean equals 3.42 and SD equals 0. 9).

Also, from (Table 5), most of the students are familiar with e-mail, chat, and discussions. Most of the students can search the Internet for scientific information (item 5 with mean equals 4.42 and SD equals 0.669). From item 7, it is clear that students are interesting with computer simulation.

Cooperative Learning Style:

From (Table 6), it is clear that most of the students prefer learning with friends and like working on projects in a group (item 8 with mean equals 4.17 and SD equals 0.718) and item 10 with mean equals 3.83 and SD equals 0.835). From (Table 6), most of the students prefer learning collaboratively with friends and enjoy discussion scientific projects with their classmates (item 11 with mean equals 4.08 and SD equals 0.669).

Self Directed Learning:

An important part of PBL is Self Directed Learning. It has been described as a process in which students take the initiative with or without help of teachers to formulate learning goals and choosing resources for learning.
From (Table 7), most of the students agree that they can take the initiative to diagnose their learning needs (item 19 with mean equals 4.17 and SD equals 0.937), identify the resources to achieve required objects of learning, select and implement certain application by searching the manufacturer Data Sheet of electronic components (item 17 with mean equals 4.33 and SD equals 0.492).

Practical Skills in Electronics:

From (Table 8), most of the students prefer practical work. They agree that practical skills in Electronics enrich their creativity (item 26 with mean equals 3.33 and SD equals 0.778), develop their self assessment (item 27 with mean equals 3.08 and SD equals 1.165), increase their sense of responsibility (item 25 with mean equals 4.00 and SD equals 0.853), and enhance their self-confidence as future engineers (item 30 with mean equals 4.00 and SD equals 0.603).

Discussion and Conclusion

The survey was very revealing of the attitudes of students for PBL and educational technologies. As can be seen from tables (5 up to 9), the overall mean for most of the items is greater than (3) on a five-point Likert scale, which means that the general student attitude toward PBL was quite positive. The Cronbach's Alpha was run and determined to be 0.731 (Table 1) which is acceptable for this research.

The need for PBL policies is today vital for our universities, because of the potential of educational technologies and the magnitude of changes they may provoke in education. The introduction and development of PBL requires the involvement and collaboration of many different units within the university. The Institution should provide to students support and training in PBL, to enhance the positive attitudes. It should be clear that students have a key role in the success of any transformation in education and the attempt to introduce PBL practices into the curriculum will unquestionably fail unless students get persuaded for the benefits. Hybrid approach should be used in our universities.

Appendix (1)

Questionnaire for Analog Electronics Students' Attitudes toward Problem-Based Learning (PBL) approach.

This questionnaire aims at exploring the **Analog Electronics** students' attitudes toward the **Problem-Based Learning (PBL)** approach. Your cooperation in answering this questionnaire is highly appreciated and will be only and strictly used for research purposes, and only summary results will be reported. By answering the questionnaire, you are contributing greatly to the general efforts of introducing the right **PBL** setting in Palestine Polytechnic University.

Gender: M / F

Do you have **a computer** and an **Internet Access:** Yes / No

Please **tick the appropriate answer** for each statement by choosing:
a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

I. Using Computer and Internet in Education:

1- I am interesting using office applications (like MS-Word, Excel).
a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

2- In Electrical Engineering, the computer should play more important roles.
a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

3- I enjoy sending e-mail and I like chatting.
a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

4- I can search the internet for scientific information.
a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

5- I believe that the internet will facilitate education.
a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

6- Using Multimedia facilitates the education of Engineering.
a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

7- I am interesting with computer simulation.
a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

II. Cooperative Learning Style:

8- I prefer learning with peers in a group.
a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

9- I don't prefer the individual study.
a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

10- I enjoy discussion scientific projects with friends.
a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

11- It is interesting to work collaboratively with other students to finish project work.
a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

12- Studying with peers means time loosing.
a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

13- I like to compute with others to solve a problem.
a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

14- I like working on projects alone.
a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

III. Self Directed Learning:

15- I can not select the topic in accordance with my interest.
a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

16- I can find the appropriate resources to achieve required objects.
a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

17- I can search the manufacturer Data Sheet of electronic components easily.

a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

18- I can't learn without help of my facilitator.

a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

19- I can learn new subjects by myself.

a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

20- I can easily ask my peer about what I do not understand about project work.

a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

21- I can select the required resistor or capacitor for certain application.

a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

IV. Practical Skills in Electronics:

22- I prefer soldering an electronic circuit instead of breadboard wiring.

a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

23- I enjoy troubleshooting electronic systems.

a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

24- Project work increases my interest in Electronic Courses.

a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

25- Project work helps me enhance the sense of responsibility

a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

26- Project work helps me use my creativity and enrich my practical skills.

a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

27- Projects encourage students to develop self assessment skills.

a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

28- Project work helps me to identify different types of transistors and diodes.

a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

29- I can easily use Op-Amps ICs to construct practical applications.

a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

30- Project work helps me enhance my self confidence as future engineer.

a. Strongly Agree b. Agree c. Neutral d. Disagree e. Strongly Disagree

Thanks for participation

Dr. Abdallah Arman

Marketing Strategy for Effective Customer Relationship Management

Kamila Tislerova, Institute of Technology and Business in České Budějovice, Czech Republic,
kamila.tislerova@centrum.cz

Abstract

This paper aims to analyse differential approaches to the Customer Relationship Management theory. The main strategies for the CRM concern the customers as the core value to the company. From establishing, developing, finishing and evaluation customer relations, with the help of technology, obtain, analyse and valuably use of the customer information and exchange at the aim of establishing a long-term relationship for profitability and competitive advantage. CRM, in some aspects, takes the customer as business partner and this concept helps the company act more effectively, efficiently and productively. The research question is: what is the proper effective strategy for customer relationship management. Several methodological approaches are examined and applied.

Keywords: CRM, marketing strategy, customer, efficiency, competitive advantage

Introduction

There are many ways how to understand Customer Relationship Management (CRM) and how to define its main pillars. Generally we can recognize it as a strategy but there are some differences and it is necessary to know how to implement CRM correctly (Solarová, 2015).

Aim and metodology

This paper aims to analyse and compare various approaches to Customer Relationship Management. It treates with different streams of CRM theory.

What to understand by CRM

The term “customer relationship management” emerged in the information technology (IT) vendor community and practitioner community in the mid-1990s. It is often used to describe technology-based customer solutions, such as sales force automation (SFA). In the academic community, the terms “relationship marketing” and CRM are often used interchangeably (Payne, Frow, 2005). It is a strategy used to learn more about customers' needs and behaviours in order to develop stronger relationships with them. There are many technological components to CRM, but thinking about CRM in primarily technological terms is a mistake. The more useful way to think about CRM is as a process that will help bring together lots of pieces of information about customers, sales, marketing effectiveness, responsiveness and market trends.

CRM is a company-wide business strategy designed to reduce costs and increase profitability by solidifying customer loyalty. True CRM brings together information from all data sources within an organization (and where appropriate, from outside the organization) to give one, holistic view of each customer in real time (Storbacka, Lechtinen, 2009).

Many CRM initiatives are motivated and measured by cost reduction. Although successful CRM programs may reduce costs, cost savings alone should never be what justifies a CRM initiative. Instead,

CRM should focus on building customer loyalty and increasing profits over time through business processes that are well-aligned with customer strategies.

Traditional CRM approach

In the first few generations of CRM we saw the basic three pillars (sales, marketing, and customer service), a common data model, and common integration points to the existing systems in the organization: ERP, legacy, and databases.

These implementations collected data across all functions in the front office, store it in a central location and use it. That data was all operational: who did what when, for how long, and what were the results. The promise of a "holistic customer representation" or "360 view of the customer" did not materialize since we were missing the most important item in the equation: what the customer wanted when they came to see us, why did they need that, and what was the result of the interaction. In other words, we had the content but we were missing the context and intent of those interaction.

Social CRM (SCRM)

In this stage organizations start to listen to customers. They acknowledge there is a lot of data about their business but don't know how to find it or tap into it. Companies feel empowered by what they are discovering — but there is still no framework to take advantage of this. The tools give some guidelines and insights as to how to proceed, but nothing really in the sense of strategy or what to do with it.

That is why one more pillar was added – Feedback Management. It becomes the fourth pillar for CRM. This is the quintessential integration that makes CRM work in a social environment. Most of what we capture from the communities must be considered feedback. The limited operational data we obtain can be easily separated by the business rules and stored in the appropriate places (Greenberg, 2009).

The IDIC model

In the mid-1990s CRM was described as the four necessary components of a succesful CRM strategy: (Peppers, Rogers, 2011)

1. Identify
2. Differentiate
3. Interact
4. Customize

The IDIC concept became famous within the CRM community. Some declared that its simplicity was misleading; others argued that it made a simple idea seem overly complex. But most disciples of CRM conceded that IDIC was a handy template for designing practical customer relationship management programs.

Interact was considered the least controversial of the four components. Perhaps that's why many customer-centric organizations are only beginning to embrace and address the various challenges of interaction management.

A well-conceived interaction strategy enables the organization to view each individual customer's behavior over time and to act on noticeable changes swiftly, at the moment when a meaningful response by the organization is likely to have the most impact.

As customer relationships become more complex, interaction management becomes a more difficult task. In addition to outbound channels such as email, direct mail and catalogs, organizations must coordinate inbound, outbound and event- and behavior-based communications (Freeland, 2003). This means tracking and responding to customers across all touch points, including traditional brick and mortar stores, call centers, and the Web. Above, all, the organization must be capable of providing a consistent face across each communication channel (Kumar, 2012).

Far-sighted customer-centric organizations now track customer behavior across multiple sources, recognizing opportunities and engaging individual customers in real time. These organizations invest in technologies enabling the kind of highly personalized customer interactions that create fresh sales opportunities and ensure loyalty over time (Slaba, 2015). Offers can be uniquely constructed based upon a customer's total history, not broader demographic data.

The four pillars of Insight Transformation

1. Relevancy

How do we use customer intelligence in our dialogue with the customer so products, services, messages, and offers are presented in such a way that is truly relevant to the customer? This means going beyond looking at the last transaction or information from constrained data fields. Take for example a customer service rep from a catalog company who made notations about a customer's purchase for their daughter's 12th birthday the previous year. This year's call in the same time period allowed the support and cross-sale initiatives to be highly relevant to the customer.

2. Context

How does our view of the customer intelligence change when we learn more about why the customer has exhibited previous behaviors and what their true underlying needs are today? Take our same example and think about how differently the rep's conversation is based on knowing the customer is gift shopping instead of personally shopping. The context of a repeat birthday shopper should also set a trigger for future contacts.

3. Timing

How do we connect customer intelligence with the critical aspect of timing to benefit from reaching customers in the right window of opportunity, creating an appropriate sense of urgency, making contact at the right point in the decision-making process, or factoring in the seasonality and cycles of customer needs? Besides the obvious timing of the birthday purchase we've established for our example, we can also factor in the daughter's age and the season of each purchase to make specific recommendations for the customer.

4. Emotive Factors

How do we enhance our customer intelligence to understand and benefit from the underlying emotive factors that lead to what the data would determine are irrational or unanticipated decisions? Knowing the importance of a birthday purchase for a close family member is valuable insight. Through the rep's dialogue with the customer, it may also be possible to capture additional emotive factors such as how comfortable the customer is making purchases for someone in this age group. The interaction is different once it is known that this is a stressful purchase where the parent depends on the helpful guidance of the rep.

Customer insight often exists in true one-on-one relationships, such as those that observant sales people, advisors, and small business owners have with their customers, because the information is typically received a dialogue that provides relevancy, context, timing and some indication of the emotive factors. In

our high-volume, high-tech environments, we must make a more significant effort to understand and apply these four components to the knowledge we gain. CRM must go beyond the minimal personalization of direct marketing letters that insert a piece of knowledge or are dependent on some basic data-driven segmentation. (Lenskold, 2003).

Other approaches

The Four Pillars of CRM Excellence are approaches to segmenting and then manage customers either directly, through channel partners or with loyalty programs:

- Customer segmentation: Understanding customer value, loyalty and needs
- Direct marketing/CRM: Setting up targeted one-to-one strategies
- Channel-based CRM: Managing customers through channel partners
- Loyalty programs: Developing effective customer loyalty programs

Factors for an Effective Customer Relationship Management

Managing relationship with customers is not a static process. For different business ventures, the ramifications, dimensions and vertices of customer relationship management are different. As the importance of managing relationship with customers is increasing at a whooping rate, both business owners and academicians are now more interested into the various strata of the CRM potential. More efficient and advanced CRM software packages are now added to the IT platform of business ventures.

According to Rust (Rust at all, 2000) the customer relationship management aims at formulating a strategic approach for the development of customer centric business approach. Understanding the demands of customers, value addition to the customer service and creation of a loyal customer base are the three important pillars of customer relationship management. To have the best customer relationship, enterprices need to allocate resource to enhance customer value, introduce reward/point system to motivate employees for a better customer service, track and analyse information related to your customers and adding customer expectations to the operational base.

Adopting a set of ideal CRM practices enables the enterprice to automate sales force, lead generation, customer interaction and surveys. Along with it, there is also a posibility to install call centre and help desk CRM software for a better customer service. All leading software manufacturers are specialising in producing CRM software packages. But the enterprice needs to pay due importance to factors like needs and nature of your business, the budget and customization capacity of the software package.

Conclusion

Whatever approach is chosen the most important is to understand CRM as a strategy. In some enterprises there is CRM approach limited only for a software solution, instead of applying customer-centric management and using all the CRM tools. It would be a great mistake to adopt the approach that Customer Relationship Management as a technology rather than a management issue. But CRM is fundamentally a business philosophy that places the customer at the heart of all organizational activity, while the technology component is no more than a supporting tool. By refocusing on the business rather than technology drivers, organizations improve their chances of meeting their real customer management needs.

Methodological Approaches to Customer Satisfaction Measurement

Kamila Tislerova, Institute of Technology and Business in České Budějovice, Czech Republic,
kamila.tislerova@centrum.cz

Abstract

This research deals with evaluation of outputs gained by five different methods of quantitative research and they were compared with those outputs gained by individual interviews and moderated discussion. The customer satisfaction methods were adopted for their usage in academic sphere. As all the tools are based on different methodology the final outputs were standardized to a joint base in three clusters (meeting the general satisfaction, willingness to apply for the same university again and the quality of education evaluation). As to results - the Kano model was the closest one to the qualitative research. Because in current time the students satisfaction evaluation creates an obligatory part of university management activity the impact to a proper methodology of students satisfaction measurement should become a very up-to-day item.

Keywords: customer satisfaction, satisfaction measurement, academic sphere

Introduction

One possible approach to the relationship of university-student relationship is provider- customer. The research presented in this post and come out of this concept, students considered for customers in terms of Czech standards. For example, standard ISO 9000 defines the term "customer" as an organization or person that receives a product (the same service).

Currently, as one of the respected principles of modern quality management the principle of customer focus, which is also contained in the standards ISO 9000. Furthermore this standard states: "Organizations depend on their customers and therefore should understand current and future customer needs, should meet customer requirements and strive to exceed customer expectations "(ISO Standrards, 2006). The last of these processes is known as measuring and monitoring customer satisfaction, which is not always completely methodically worked out and adjusted to the conditions of a particular organization (Staes, Thijs, 2010). Therefore, the research was conducted, which should propose the most suitable method for measuring student satisfaction.

Methodology

The aim of this research was to compare the results that can be achieved using qualitative methods (Cheikh, 2015) here with the usage of a structured interview and subsequent controlled discussion with other possible tools for measuring student satisfaction. Such methods were taken into account that are not personalized for student issues, but they are engaged in measuring customer satisfaction in general, as reccommended by some researchers (Zikmund, 2013, Kamf, Ližbětinová, 2015). The subject of research have already been pre-selected methods, it is not a complete list of possible approaches.

For interview and subsequent discussion four groups of students undergraduate program were chosen in order to ensure the greatest possible heterogeneity of the group. Each group consisted of 10 students with proportional representation gain (average grade for the previous academic year), proportional representation taught degree courses and the gender issue was dealt with according to the total proportion of men / women, ie. 40/60.

The survey was conducted in two stages. First, qualitative research was performed with a minimum of one week apart was a quantitative survey where students filled five questionnaires were compiled in keeping with the tools to measure student satisfaction (resp. Customers), ie. on the basis of five different methods.

When evaluating the results of the survey main purpose was to compare the outputs of different ways to measure satisfaction with the outcomes of a qualitative survey and draw conclusions - ie. to evaluate which method of evaluating student satisfaction showed similar results to the nearest resulting from qualitative research.

For final comparisons there were identified as the common denominator the three main indicators:

- Meeting the expectations overall (average rate meet expectations in%)

- I would apply this university again (% of respondents)

- Perceived Quality of education gained (the average perceived level of quality in%)

When evaluating, all four groups were merged into one file, because their own investigation was not relevant. Separately it was only necessary to conduct a survey - interviews and facilitated discussions.

It should be clarified still the basis for this research:

Standard DIN EN ISO 9000 and gives the definition of satisfaction: "customer perception of the degree of fulfillment of the requirements" (ISO Standards, 2006). The practical effect of the low level of customer satisfaction are their grievances and complaints. However, the scope of complaints are not considered to be the only and decisive indicator of student´s satisfaction. Customer satisfaction measurement should be in this concept based on the rate provided positive perception of the product / service, ie. education. Specific remains a matter of values, which in case of students could be positively perceived the low demand studies (and therefore the preferred page of the product offered). It is, however, in this survey minimized by selecting such a structure of respondents with proportional representation based on results of studies, which can be expected to ease study is not the main objective and that the criterion of satisfaction of the entire sample of students.

Analysis of potentioal tools

As mentioned above, this research does not aspired to perform a complete comparison of all available methods for the evaluation of customer satisfaction. Only some of the methods were selected and tested. Such methods where it was estimated that their informative value could be as close to those results obtained from interviews and facilitated discussions.

Net Promoter Score

Applying the Net Promoter Score (NPS) for managing customer satisfaction and loyalty offers a wide range of applications. Among the basic advantages of this method ease of implementation and direct linkage of data on the company's ability to retain important profitable customers as well as acquire the new ones belongs (Riecheld, 2006). In terms of "business community", this method ensures high correlation with future shopping behavior of customers, which in case of academic environment means that satisfied students are ready for higher performance while providing great reference value.

The principle of this method lies in the research, based on a simple question asked customers who use the product / service, in the form: "How likely is it that you would recommend on a scale of 0-10 (and) our company / service colleagues or friends?" Customers 0-6 respond, are classified as "critics" who are not satisfied with the services, respondents with values of 9-10 are classified as "supporters", ie. as loyal clients to support growth, while 7-8 are classified as "Passive" who are from the

perspective of methods NPS neutral, and with them the need to work and to ensure that from them ideally become "fans" instead of "critics".

The resulting index NPS is then easily calculated as the difference between percent of respondents-fans and the percentage of respondents-critics.

CAF – Common Assesment Framework

The CAF is a quality management tool, which was created specifically for the conditions of public sector organizations. It is the result of cooperation of EU Ministers responsible for public administration and from r. 2000, when it was rebuilt its first version and it is by the European Institute of Public Administration (EIPA) further developed. The CAF model is based on self-esteem, which helps the organization to identify its strengths and also get an overview of the activities leading to the continuous improvement of the performance of the organization (Goler, 2010).

The goal of this method is to facilitate a self-assessment of public sector organizations and get an overview and analysis of the organization's activities aimed at improving the organization, to serve as the interconnection of the various instruments used in quality control while facilitating benchlearning between public sector organizations.

Using the CAF in comparison with other models TQM is relatively easy, so it is especially suitable for organizations with quality management begin. The CAF is a universally usable tool. To the organization, it is possible to CAF, and in particular the method of its application to edit - while preserving the basic elements of the model: 9 criteria, 28 sub-criteria and evaluation panels.

Customer Satisfaction Index

The results of the measurement of customer satisfaction are often expressed in the so-called. indexes, eg. American Customer Satisfaction Index (ASCI since 1994) or the European Customer Satisfaction ESCI index since 1995 (Kozel, 2006).

The ECSI method (European Customer Satisfaction Index) tracks the seven areas that have a decisive impact on customer satisfaction:

- Image
- Expectations
- Perception of Quality
- Perception of Value
- Customer satisfaction
- Customer complaints
- Customer loyalty

Customer Satisfaction Index have several modifications. UKCS (UK index) consists of 20 areas of perceived customer preferences, which biannually adjusted according to the actual situation.

Research using a satisfaction index is based on proven and sophisticated methodology and the results are clearly measurable and comparable. (Liu, et all, 2011). The value and significance of these findings increases with the length of the time series, after which the entity performs customer satisfaction measurement is conducted.

Evaluating customer satisfaction with these indexes very well serve as a benchmarking within the fields of activity of the companies.

Note for application in academic sphere: a comprehensive questionnaire would not identify just satisfaction with a particular teacher, but it can reflect such characteristics as confidence in an educational institution, fulfilling expectations before entering college or selecting a specific object, pleasant environment and facilities, availability of resources, satisfaction with accompanying services (Canteens), possibility to solve their problems (study department academic Senate), belonging to the school, department and others.

KANO method

In the early seventies Professor Kano worked on the project of improving services and products, and used Herzberg's two-factor theory of motivation. His method is based on the fact that customers perceive various parameters of products and services very differently and not always linear.

This method identifies and distinguishes three types of product parameters:

- Parameters that must be complied with at all times. These are also called passive quality or expected quality because most of their customers meet the expected automatically to describe their requirements, these factors therefore does not even mention. If they are fulfilled, customers are not enthusiastic, but if not, they are dissatisfied.

- Parameters expressed by the customer - these are the parameters that the customer wished to have a significant impact on the evaluation of performance and satisfaction.

- Parameters that are "something more" - an active quality, quality that inspires enthusiasm. Meeting these parameters is for the customer unexpected. When it is delivered, the customer is excited, surprised. Quality parameters of this function work only if they are also satisfied expected quality parameters (Willemsen, 2010).

Satisfaction survey method involves two issues: Rate your satisfaction if the product has this attribute, and Rate your satisfaction if the product hasn´t this attribute.

The results are recorded in quadrants according to the four possible answers: satisfied, neutral, dissatisfied, do not care.

ServQual Method

Method for measuring the quality of services developed in the 80s in the US and gradually developed and revised. Its cornerstone is called paradigm of conflict between the ideas of customers and what kind of service they receive. Research using SERVQUAL method is based on the so-called GAP model - Model gaps. The methodology therefore works with gaps between different components of the process of providing services that the customer perceives. The authors of the method A. Parasuraman, W. A. Zeithaml and L. L. Berry, on the basis of qualitative research found these five gaps (Zeithaml et all,1990).

GAP model shows five gaps that exist regardless of the type of services, namely:

A space no. 1 - between the perception of customer expectations and the company´s management, what is the real customer expectations

A space no. 2 - between the perception of customer expectations by management of a company and between the organization set characteristics of services

A space no. 3 - between what the company has set as standards of service and what the service is actually provided

A space no. 4 - between what service customers receive, and between what is given by media sservices presented to public.

A space no. 5 - service between customer expectations and experience of its existing service.

Among these five sections is divided another 21 properties that describe various aspects of the described levels from two perspectives of the customer, expectations and perceptions. The resulting system consists of 42 questions and allegations that customer then evaluates the questionnaire on a scale from 1 to 9 points (from full consent to the full disagreement). The greater the difference between the expected and perceived quality represented by the average mark point is, the higher the level of service is. Respondents also assessed the relative importance of all five dimensions and their order.

Advantage of methodology SERVQUAL is a general purpose, eg. for comparison of the level of services to other companies in the industry. The method seeks to understand the service area as fully and to obtain the most reliable data. Using this method it is possible to determine not only how the service is percieved by customers, but also by its employees. While questioning individual traits satisfaction it is possible to get clear information on how customer satisfaction is influenced by its expectation.

Current approach in satasfaction measurement

Conducting regular evaluation of every university in the Czech Republic (and its activities and publish their results) is ordered by the highest standard of the Ministry of Education, Youth and Sports of the Czech Republic for Higher Education - Higher Education Act no. 111/98 Coll. as amended.

Nowadays, the term "student quality assessment - SHK" hiding all sorts of questionnaires in which students evaluate their teachers, if necessary learning process on a larger scale. Questionnaires somewhere prepare themselves teachers, students or a group of selected experts. Very often, however, the questioning is conducted without the knowledge of methodical process of research, with a low communication between the organizers and students, which ultimately leads to the collection of the low number of completed questionnaires or unrepresentative representation of respondents. Improper interpretation of the data thus obtained is in addition to a significant distortion outputs.

If achieved some answers, which are analyzed and interpreted, then it depends on the attitude of management that allows to publish the results, respectively if the measured data lead to some axles.

Comparison of examined methods

For the final comparison three main indicators were defined:

- Meeting the expectations overall (averagae rate of meeting expectations in %)
- Would apply again for the same University (% of all respondents)
- Perceived quality of education gained (average percieved rate of quality in %)

Table 1 – comparison of results obtained by examined methods

Methods	Meeting expectations	Would apply again	Quality of education
NPS	76%	85%	46%
CAF	62%	88%	35%
ECSI	79%	73%	51%
KANO	77%	78%	62%
SERVQUAL	58%	62%	56%
INTERVIEW	61%	78%	62%

Source: own processing

Conclusion and discussion

The results of each method show some differences that can be identified as statistically significant. Partly it may caused by not quite perfectly tailored methodology for applying to universities, but it also may be due to the ability of each method to capture the phenomena.

For this survey the investigation carried out through interviews and facilitated discussions was established as an authoritative guide - outcomes from other methods are measured and compared with it. From this perspective, the closest result was achieved through the method of KANO model, which according to investigations carried out, seems to be most suitable for development in terms of academic field.

Anyway, we can state that uniquely valuable satisfaction ratings were obtained by means of qualitative research, which is currently discussed cause of dissatisfaction, easily record the sensitivity of a respondent on the phenomenon (as important to him) and can also record some very productive and constructive suggestions for improvement.

Although it is obviously not realistic to enforce this attitude survey of student´s satisfaction across the board, as each focus group, these groups individually processed respondents are able to detect what can not always be completely describe in structured questionnaires.

Limits and reccommendations

Although in the context of the research the used methodswere not in detail adapted to the conditions in academic sphere (it would be a matter of individual projects) and therefore it is necessary to apply certain leeway in interpreting their results, we can state that the outputs of the various methods applied to the satisfaction of the students exhibit significant volatility and interpretation resulting from their usage can not be considered as definite.

In combination with the fact how little students involved in Student's evaluation of the quality seems to be the most reliable qualitative investigation, ie interviews with these students who appear for the quality evaluation interest, show a proactive approach to this issue and also their composition conforms to the profile structure of the students of the high school.

As one of the tools for measuring student satisfaction can also be used the so-called Trendence Graduate Barometer (formerly the European Student Barometer), which is an annual online student survey which allows students to express their views on topics related to careers and education. Since its launch in 2003, steadily increasing the number of participating students.

In the last year involved more than 195,000 students, making it the biggest trend Graduate Barometer survey targeting a career in Europe. Trendence Graduate Barometer provides universities and companies valuable insight into the preferences and expectations of students, and in addition facilitates their entry into the labor market because it is actively pursuing and employers.

This survey was attended by 775 involved universities from 22 European countries. The methodology of this survey is developed enough - it is an internationally certified ESOMAR methodology.

Despite the facts, current and new methods for customer satisfaction measurement should be developer for the specific environment of academic sphere.

Vladimir Petrovich Gorshenin, Chelyabinsk, Russia

Abstract

Nowadays in our fast-moving world companies are looking for new ways how to be competitive on the market. Some companies pay a great attention to the tangible assets and technical capacity; others prefer to use innovative technologies and know-how. But modern market conditions allow us to use all things mentioned above. Over the past 2 decades scientists have gained new insights about human behavior, which influence straight to company's success.
Brain scientists find out that to reach the best performance it is necessary to pay great attention to employees behavior, emotions and motivation stimulus. Neuromanagement is quite new scientific sphere of studying the capacity of the brain, but the results of this study are very perspective. New methods, methodologies and programs are established and can be used in real business sphere. Golden circle" by S. Sinek is one of such new methods; it touches on the question of organizing the work not only separate managers but the whole company. And this model is a real confirmation of triune brain.

Keywords: effective leadership; neuromanagement; golden circle; neuroleadership.

Introduction

The company success depends on human resources and the next aspects are tangible assets, technical capacity and available cash assets, which company is ready to use for strategic development.

Nowadays you can face the myth "great manager or top-manager is a person, who is ready to work all day long 7 days per week, and he or she succeed in everything". It is hard to imagine the manager's brain activity and how exhausting it is: phone calls, answering letters, tactical tasks, and managing employees. But at the same time he or she doesn't have time for hard projects, for example, strategic projects or strategic development. Such behavior model isn't effective nowadays and it is necessary to find new ways how to organize work process and feel comfortable at your work place. Making changes in the existing work team is a long, difficult task; moreover if you face the resistance of the proposed changes, and you can't find the understanding among employees, you can say that the chances of success tend to zero. Many scientific works mention that employee's behavior in the workplace is not the same as many managers think. This misunderstanding can be the reason of unsuccessful attempts of changing process, because initiatives of the head are not supported by the staff.

The main body of the paper

Over the past 2 decades scientists have gained new insights about human behavior as a result of the integration of such sciences as psychology (the study of human consciousness and behavior) and neuroscience (the study of anatomy and physiology of the brain). At the junction of two sciences appears a new direction - neuroscience, which includes: neuromanagement,

neuroleadership, neurobiology, neurotechnology. Neuroscience has been researching what parts of the brain respond to different types of stimuli associated with social interaction.

Modern business is developing in the conditions of innovation-driven economy in which science and technology are the basis of competitive ability and a productive force. Most of the managerial decisions are taken in the context of limited resources and high uncertainty, because they depend on many factors, the dynamics of which is not always possible to estimate with reasonable accuracy. Therefore, many companies are looking for new ways of development. In Russia companies only now start thinking about personnel as the major part of development and prosperity. This research is based on study foreign works about innovative ways of managing human resources. And one of the main results that authors of this paperwork could find – neuromanagement is well-known among international specialist and companies but in Russia the term “neuro” is unknown.

The term “neuromanagement” in the international literature

The term of neuromanagement was formed in 2006 by Qingguo Ma, a professor and director of the neuromanagement laboratory at Zhejiang University. The first mention of the term neuromanagement and the study of the brain with the help of medical research were made in the conference by David Rock, the founding president of the NeuroLeadership Institute [5].

Neuromanagement is a new science, created at the intersection of neuroscience, psychology and management. Scientists use magnetic resonance and computed tomography study of communication and the structure of the brain, the mental processes of a man when he is faced with the typical problems in economics and management. This study provides insight into the decision-making and human behavior in society. [7]

Neuroleadership is an area of leadership research and improve company performance through understanding how the human brain works. The main aim of neuroleadership is helping organizations realize their potential through the understanding of the processes of the brain and mental activity of the person at the individual, team and organizational level. The term neuroleadership was proposed in 2006 by David Rock (David Rock) [5,6].

The main idea, which is headed by neuromanagement, is triune brain model, which is actively involved in all spheres of human life. The first part - the brain of a lizard - a primary brain and is responsible for the survival instincts: food, water, sleep and procreate. The second part - it is the limbic system - it is responsible for emotions and meanings. It is here that all that belongs to the category of the irrational. The limbic system is not capable of language and perception, is engaged in a "new" layer of the brain - the neocortex. The third part - neocortex - is part of the brain associated with the conduct of intelligence, language, abstraction, planning.

Nowadays you can find many good examples of successful work in the company, which effectively organize the work of their staff in view of the theory of human behavior, the structure of the brain and the understanding of the basic principles of neuromanagement. One of the main principles is understanding that in our fast-changing world it is not so important to have external motivation of employees. Doing business under the laws of neurobiology is much more complicated because we have to consider what others think. In the brain, there is a special kind of nerve cells, called mirror neurons. These are the cells that are responsible for empathy and allow people not just copy the actions of other people, but also their emotions and mental state. The discovery of these cells shows that we can feel other people, and with some accuracy to predict their wishes, intentions and goals. Moreover team members can mimic their leader’s actions,

emotions and intentions. We can see the world through the eyes of others. This helps to cooperate more effectively with the world in which we live [5].

One issue that is now set in the field of personnel management - "can a man be happy in the workplace"? Neuroscientists say that happy people are much better than those who feel unhappy at work. Staff keen for his work, do the job better and more immersed in it. If you have negative emotions, thoughts, a person primarily would focus on the source of the "pain", and these will lead for stopping to process information, think creatively and make decisions.

David Rock in his work "The Brain. Instructions for use" studied the “threat-reward" scheme, which accompanies and governs human behavior. A "threat" is meant not only physical dangers and threats, but under this concept can be interpreted social situations, the working moments and our environment [5]. "Labels" of the threats or potential rewards are stored in the amygdala in the limbic system, which is responsible for the entire encoding process and storing information. Every time a person encounters something that was coded as a threat or as a reward brain will automatically react to this event and neurological reactions are run. Recently, neuroscientists conducted a series of studies using MRI and they provided evidence of what happens when the brain begins to perceive the potential "threat-reward" scheme.

The most interesting discovery was turned out that neural responses in the "threat-reward" scheme are identical to those that are activated when a person starts to social interaction with other people. This means that the human brain responds to social situations (friendship, dating, conflicts) in the same way as on the physical interaction (pain, food). It also means that the brain perceives the workplace as a social environment that can be one of the categories "threat" or "reward". Some managers have noticed that a new approach casts doubt on Maslow's famous pyramid in which it is assumed that people will begin to meet their needs, starting with the physical survival and moving step by step up the stairs to the top. In this pyramid the social needs are in the middle, and self-actualization is at the top. Some current researches in neuroscience show that the brain equates social needs and survival, for example, be hungry and be rejected by society as the same, and causes the same reaction nerve [6].

The "threats" are an obstacle to people’s development, improvement and promotion, and they concern both - people and the organization in whole. This is due to the fact that when the limbic system begins to respond to possible threats the prefrontal cortex is in the possession of the little oxygen and glucose, but the prefrontal cortex is the basic place where all thought processes are going. Thus the "threat" inhibits our ability to understand and make decisions, remember, plan, solve problems, communicate. In other words, when people need more brain resources and brainpower available resources will be temporarily limited by the prefrontal cortex. This impact is easily tracked in the organizations. When leaders create an unstable atmosphere in the team, the brains of employees work less efficiently.

But it is quite the opposite situation, if the organization offers a friendly working atmosphere: employees feel comfortable and can express their proposals, the leader gives the freedom to make decisions, supports the contribution of employees to the development of strong relationships. All these simple things create a reaction of "reward" scheme, and the work becomes more productive, organization becomes open to new ideas, innovation and creativity. It was noted that the information that was passed to employees during stressful situations, was not perceived by staff.

“Golden Circle” by Sinek

Simon Sinek, as well as John Lesinski (the author of the theory of "zero moment of truth") say that people do a lot of things unconsciously, guided by the principles which were incorporated in

human evolution. Sinek S. argues that people do not always respond to the language, but are good at understanding the treatment at the level of emotions and images. He suffered the basic idea on his model of the "Golden Circle", which is not only reflects the resources available to the organization, but also shows that what should be done for the effective management of the organization. He found the confirmation of his model in the study of large successful companies, e.x. Apple, Dell, Google and working with influential leaders. Sinek noticed one feature that thinking, which is characteristic of successful managers, is the exact opposite of what how most people are thinking, acting and communicating [4].

According to the "golden circle" the majority of people and organizations know that they need to do for living. Most of them also know how to do it. But only a small group of elected people know exactly why they do what they do[3]. In the book “Start with why’’, written by Simon Sinek, he mentioned that it is always necessary to start with the question "why" - the goals, the reasons of your own beliefs, which will lead eventually to the finished result - the "what". The idea of the final result may vary, but awareness of why it is intended and what is - no. Also, under the "why" Simon Sinek means the ways to encourage inspiration and the people that they should do something from which they enjoy. Go to last into a modern enterprise system include personnel motivation. Sinek Simon argues that the concept of the "golden circle" explains why not many people and organizations can lead others, but few know why they do what they do. Under the question "why" does not refer to profit or money, because this is the final result. Under the "why" Sinek understands why your organization exists, what it believes, what are its values.

Simon Sinek in the model calls for change thinking and to move from a well-established system of work "What-How-Why" to the more effective "Why-What-How", to change mind and start from the center and go to the outside of the circle. It is expected that most companies spend all their energies to the story of "what" they are doing, they refer only to the neocortex. A man only information about the "what" should be done or "what" is the company, the product is very small. "People do not buy what you are doing. They buy the "why" you do it. " The report on the benefits of a product falls directly in the neocortex and remains there. To get a person to buy a product, run an errand, you should immediately refer to the section of the senses, that is, to make a person believe in the idea, believe what you believe is you and your company.

This model shows that the focus of the company shifted to a simple possession of material resources to competent and effective corporate governance component of the organization - corporate culture, style, values and attitudes, which adheres to the company's management. Implementation of the changes, the introduction of a corporate constituent - a long process that requires hard work, both from the management (managers, opinion leaders), as well as on the part of employees. One of the possible levers of influence on personnel - motivation program [1,10].

One of the tenets of modern management - focus on internal rather than external motivation. Numerous studies have shown that external criticism or financial incentives human almost no effect on its performance. Work with maximum commitment is possible only when we are motivated internally. In this case, people do not need external commendable because they already operate at full capacity [9].

Modern science management understands that people do not want their every move watched. You must provide the employee a maximum of responsibility, and not to follow his every move. To achieve this you can use the Socratic Method - the method of proper questioning. In order to set employee goals should ask themselves to determine their colleagues. To give feedback, it is necessary to ask the opinion of his subordinate about their work. Rather than tell the algorithm to solve the problem, ask the employee how he is going to do it. When people solve the problem by you, then there is a surge of adrenalin, which activates neuronal cells in the brain. Socratic Method

underlies the practice of coaching, when instead of lectures and provides a turnkey solution, coachers ask relevant questions and encourage their clients to seek and develop solutions on their own [8].

Conclusions

It is much faster and easier to give the employee a direct order and use strategy issues requires more time and effort, but in this case the employees take responsibility and become managers themselves. Employees do not work for the manager - he is working for them. Managers need to stop thinking that they can control someone's behavior through incentives or penalties. The best thing that can make a manager - is to create an environment in which employees choose their own behavior they need. When a person believes in the idea, it is lit, fade into the background vacation, money, because faith makes sense of moving forward, it encourages action.

Business - it is a sphere of human activity. Strategies are created and implemented by people, competitors and customers, as well as managers - the people. When we use the knowledge gained through research of the brain, it becomes easier to understand every aspect of the business. Discoveries in neuromanagement will help us to benefit not only business, but also learn to evaluate situations that occur in life, and as a result to make effective decisions. "The indicator of management quality - ordinary people doing extraordinary things," - said Peter Drucker, management theorist.

Abstract

The Strategic Trade Act of 2010 (STA) implementation in Malaysia is to fulfil Malaysia's obligations under UN Security Council (UNSC) adopted Resolution 1540 (UNSCR 1540). The Act came into force in 2011, the STA has been pertinent in addressing several major areas of concern in regional and global trade security and academic researchers' are indirectly involved in this area of concern. The STA 2010 was established as a "mechanism to address the issues of a lack of monitoring and control of exports, imports, transshipment, and brokering of strategic items" (STA 2010). The STA particularly addresses re-exports and dual-use controlled items such as weapons of mass destruction (WMD). The STA involves academic, researchers, students, employees, scientific research and development committee. The objective of this research is to explore best practices that can be turned into an ethical code of conduct for academic researchers in Malaysia, guiding them to prevent biological agents from being proliferated for bioterrorism in their academic research. The methodology for this study is doctrinal research based on the current analysis of STA 2010 legislation. This study indicated that universities ought to incorporate envisioned ethical code of conduct such as compliance with STA 2010. This paper analyses the impact and consequences of the implementation of the STA on the current academic, researchers, students and also scientific research and development committees. The researchers here concluded that the current implementation is still at an incubating stage for many academic researchers in that many researchers both in public and private universities are still unaware of the existence of STA 2010. The researchers recommended

solutions and activities to create awareness of STA 2010 for academic researchers both in public and private universities.

Keywords : Strategic Trade Act 2010, Academic Researchers, Code of Conduct, Best Practices

Introduction

Strategic Trade Act 2010 (Act 708) (STA)

In Malaysia, implementation of the STA (1) has involved collaboration among several government agencies. Licensing is coordinated by the Ministry of International Trade and Industry, the Malaysian Communications and Multimedia Commission, the Pharmaceutical Services Division, and the Atomic Licensing Board. Enforcement is done by the Royal Malaysian Customs, the Royal Malaysian Police, the Malaysian Maritime Enforcement Agency, and the Malaysian Communications and Multimedia Commission. The Attorney General's Chambers and the Royal Malaysian Police are responsible for prosecution of violators. Meanwhile, the Strategic Trade Secretariat acts as the focal point for implementation and is responsible for overall strategic trade management. It maintains an online system, issues licensing guidelines, conducts outreach to industry, and leads audit and interdiction team. There are challenges associated with a multi-agency approach to strategic trade management. It is difficult to foster understanding of the role and work of other agencies, and perhaps even more challenging to ensure effective communication and information exchange among these agencies and academic researchers hence, developing effective implementation or system to solve these problems, is pivotal especially among the researchers, academic especially on scientific research which may involves work of indirect controlled items.

The written laws related to STA 2010 are:

"1. Animals Act 1953 (Act 647)

2. Atomic Energy Licnsing Act 1984 (Act 304)

3. Chemical Weapons Convention Act 2005 (Act 641)

4. Customs Act 1967 (Act 235)

5. Pesticides Act 1974 (Act 149)

6. Plant Quarantine Act 1976 (Act 167)

7. Prevention and Control of Infectious Diseases Act 1988 (Act 342)

8. Protection of New Plant Varieties Act 2004 (Act 634)

9. Poisons Act 1952 [Act 366]

10. Malaysian Communications and Multimedia Commission Act 1998 [Act 589]"

"If there is any conflict or inconsistency between the provision of this Act and those of any written laws (in relation to the prevention of the proliferation of WMD and its delivery system), including the related laws, the provision of this Act shall prevail and the conflicting or inconsistent provisions of the other written laws shall, to the extent of the conflict or inconsistency, be deemed to be superseded as per section 3(2) STA 2010" (2).

The Process of STA 2010

The criteria for compliance requires the academic researchers of strategic items, must register with the relevant authority this is to follow practice whereby governments are taking steps to promote compliance with export controls and risk management. "Throughout Southeast Asia, attempts to implement the UNSCR 1540 have met resistance or lukewarm interest",(3) possibly due to insufficient financial and technical resources".

The Act defines "strategic items" as "goods and technology that are controlled under the Act, leaving a comprehensive list reflecting the items currently required to be controlled under the global export regimes as well as the UNSCR 1540 to be prescribed in subsidiary legislation, beginning with the Strategic Trade (Strategic Items) Order 2010". As at 3rd January 2011, the strategic items prescribed fall within the following categories (4)

"(a) military items;

(b) nuclear materials, facilities and equipment;

(c) special materials and related equipment;

(d) materials processing;

(e) electronics;

(f) computers;

(g) telecommunications and information security;

(h) sensors and lasers;

(i) navigation and avionics;

(j) marine; and

(k) aerospace and propulsion".

The above legislations are prescribed as strategic items under STA 2010.

The Act will be implemented through an online system, the Strategic Trade Secretariat is working closely with "DagangNet" as the service provider to develop the online system for registration and application of permits. A few government agencies (5) have been authorised to issue export permits, the "DagangNet" online system is the only conduit for those seeking an export permit under the Act.

Application of Online Permit

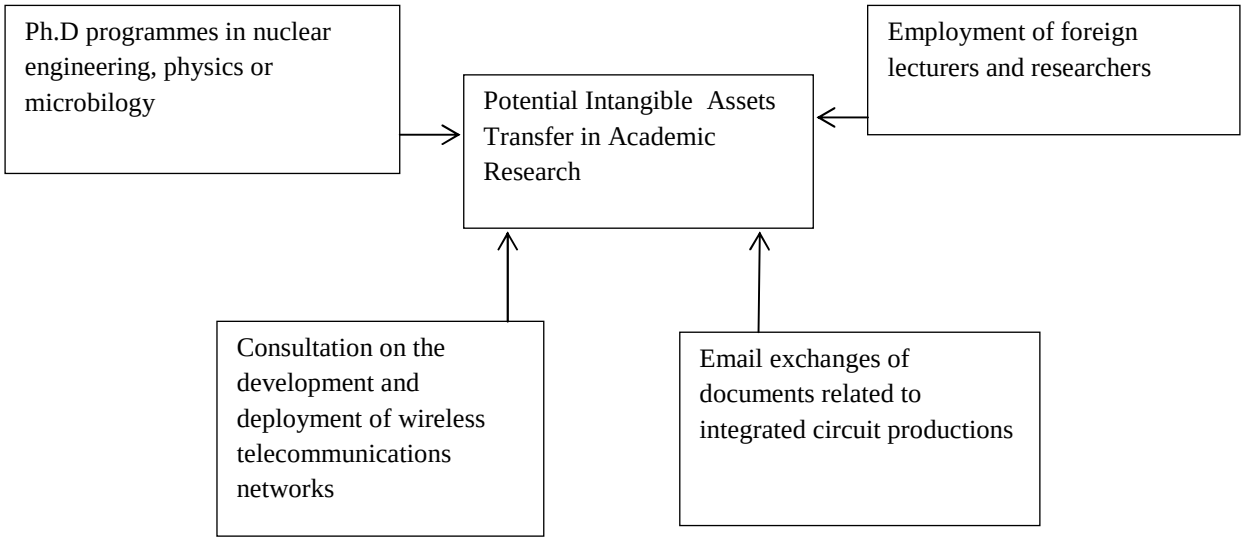
Online application needs to address all types of potential information transfer, including post-graduate teaching, papers at conferences, seminars, workshops, collaboration with academics in other countries. Audit operation will be conducted by the University and any licence which has been granted the University shall keep a record of the audited licence. The Universities can apply online permit application through the appointed agent from the Ministry of Trade and Industry Malaysia (MITI).

4. Implications

Universities, can be made legally responsible if employees breach the STA 2010, in view of this, universities need to consider how to ensure these controls so that its employees, researchers and students comprehend the controls and do not fall into liability.

Undergraduate teaching is usually outside the scope of WMD for several reasons. This is because the teaching objectives does not normally address controlled technology. Material used for education is generally in the public domain and teaching often disseminates 'basic scientific research'. Whereas, for post-graduate teaching which may involve translational research rather than fundamental study. In case the postgraduate teaching is the area of a listed technology, a licence is required if it involves export (i.e. sending material from Malaysia) of unpublished information which would be required and necessary for the use, development or production of strategic items. The principles and rationale on Strategic Items in STA 2010 is catered to assist universities to understand how the legislation applies to their activities. Universities need to work with researchers, employees and students where there is a potential adverse risk to understand and risk manage the implications and impact on STA 2010 on their research and teaching activities.

Chart A : Potential Intangible Assets Transfer in Academic Research



Source : Developed by researchers

The above chart indicates the potential intangible assets transfer in academic research and hence the University involved ought to take cognizance of such potential intangible transfer which may be listed as strategic items under STA 2010.

Conclusions

Nobody likes to be caught for criminal activities intentionally or unintentionally especially in the academic research fields therefore, it is suggested that the government of Malaysia should create more awareness of the STA 2010 through academic institutions and increased man powers to assist the universities to set up a monitoring department to process the Strategic items /indirect controlled items as stipulated in STA 2010. The researcher suggest the following recommendations :-

1. Create and furnish awareness by training students, researchers, employees and administrators.
2. Furnish, leaflets, brochures, online and literature about threats.
3. Act as a resource for questions and concerns (such as matters involving export controls).
4. State examples of specific threat information, if required.

Abstract

This papers Identified the variables which are applicable to the accomplishment of the usage of Cloud Systems in inventive Supply Chain settings in Qatar. The paper discover answers of examination inquiries; What are the components which could encourage and maybe ensures the achievement of the execution of Cloud Systems in imaginative Supply Chain settings in Qatar?. In this study, it is recommended that the seven arrangements of speculations that are liable to effect on achievement or generally of Cloud Systems execution in Qatari firms been distinguished. The study embraced the both quantitative and subjective strategies to inspected the proposed speculation. Suppliers of business and framework joining administrations require suitable stages for creating and introducing the applications. They are confronting the test of incorporating innovation situated framework with business forms. This study is proposed to give both hypothetical and down to earth new bits of knowledge into the execution of a Cloud System as a vital information administration device. The study inferred that a Cloud System execution is unpredictable and includes various diverse equipment, programming and foundation setup. It is expected this study pointed various variables that added to the accomplishment of a Cloud Systems execution as a vital learning administration device in the chose creative inventory network as well as in different associations in Qatar. It is trusted that the structure displayed in this study and the discoveries exhibited could shape a base central hypothesis that can help advance improvement in Cloud System research in Qatar.

Keywords: *Innovation, Cloud Systems, Supply Chain Firms, Technology-oriented System*

This Paper is part of research proposal that has been submitted to Qatar Foundation (QNRF) Grant. Proposal ID: NPRP 6 - 026 - 5 - 005 . Proposal Title: Determination of Implementation Success Factors for Cloud Systems in Innovative Supply Chain Firms in Qatar. The project hasn't funded from QNRF.

1.0 Introduction

The power of developing rivalry fuelled by the quality of rising globalization has introduced new weight on production network firms to be more imaginative than some time recently. Development might happen at any or all the three advancement levels; a) specifically development in item including making of new items and/or alteration to existing items; b) development in the administration to clients and c) or advancement in the administrative parts of the firm undertaking the advancement including inventive firm structure and approaches as well as methods of the firm (Soliman, 2011a, 2011b, 2012a, 2013a, 2013b).

1.1 Objectives

The aims and objectives of this project are to:

1. Identify those factors which are relevant to the success of the implementation of Cloud Systems in innovative Supply Chain settings in Qatar.
2. Present a methodology for appraisal of the Cloud Systems' ability to transfer knowledge for innovation purposes.
3. Assess the various knowledge characteristics required by the innovative supply chain firm in Qatar.

1.2 Research Problem

Evidence points to: a) increased growth in the implementation of Cloud Systems particularly in Supply Chain firms, and b) the size and magnitude of the investments in Could System implementation represent a substantial and significant part of organisational resources. Therefore, it would be imperative that a study of the implementation of Cloud Systems is conducted with the aims of ensuring that the implementation could deliver the anticipated outcomes. Otherwise, Qatari firms could be at risk of negative impact and poorer performance should implementation of Could System fail to deliver anticipated results. Accordingly, the research problem is to find answers to the following research questions to:

1. What are the factors which could facilitate and perhaps guarantees the success of the implementation of Cloud Systems in innovative Supply Chain settings in Qatar?

2. Could those factors lead to development of a method for assessment and perhaps measuring the Cloud Systems' ability to transfer knowledge for innovation purposes?

3. In doing so, would it be possible to identify the knowledge characteristics required by the innovative supply chain firm in Qatar as part of the effort to transfer knowledge?

2.0 Literature Review

Advancement is somewhat in light of realizing which thus is subject to learning and in that capacity there are five stages during the process of Innovation Knowledge Transfer (Soliman, 2012a):

- ***Knowledge Transfer***: The inventive inventory network firm seek after the vital information for the development by distinguishing and exchanging the information from inward and outside sources to the production network firm.

- ***Scanning***: The innovative supply network firm seek after the fundamental identifying of knowledge the development and exchanging the information from inside and outer sources to the inventory network firm.

- ***Decision***: Decision by the innovative supply chain firm whether to adopt or reject the scanned knowledge based on measuring the favourable circumstances and the weaknesses of utilizing that knowledge as a part of its present structure.

- ***Implementation***: During this stage, the innovative supply chain employs the selected knowledge in accordance with already determined implementation strategy.

- ***Confirmation***: Decision by the innovative supply chain firm whether the implementation has produced the desired outcome and ultimately a confirmation on whether the implementation has been successful.

Despite the kind of innovation, the innovative supply chain firm should avoid any poor or undesired outcome from implementation of the knowledge transferred. Accordingly, the supply chain need to rapidly innovate use an effective and efficient implementation strategy to ensure the desired outcome of the implementation is achieved (Soliman and Youssef, 1998, 2001, 2003a, 2003b).

A key factor in the complex process of knowledge transfer is knowledge itself. This means, getting the right information in the right development process at the opportune time will be one of the many challenges facing the innovation leaders (Soliman, 2013a, 2013b). Those challenges have led many organisations to search for tools and systems that could facilitate the transfer of knowledge though the innovation processes. In this regards, many innovative supply chain firms have considered Cloud Systems to support their innovation efforts as well as satisfying other organisational needs including efficient and effective knowledge transfer. However, many enterprises are also turning to Cloud Systems for fast and less costs (Bartoletti and Reichman, 2012).

2.1 Cloud Systems for Knowledge Transfer through the innovation Chain:

Soliman (2011a, 2011b, 2012a) has shown that the development chains comprise of three basic stages in particular, information based stage, learning association stage and the advancement stage. Besides, Knowledge Transfer is demonstrated be a typical basic action all through the three stages (Soliman, 2011a, 2011b, 2012a, Senge, 1990 and 2006; Pedler et. al., 1991, Garvin, 1993). The most widely used Could Systems implementation is the implementation of the software components known as Software-as-a-service (SaaS) components. This is due to the following reasons:

1. SaaS is the biggest and most unequivocally developing distributed computing market.
2. SaaS comprises of a wide range of sub-parts, for example, client relationship administration (CRM), human capital administration (HCM) and eProcurement.
3. SaaS furnishes combination with big business asset arranging (ERP) frameworks.

The greatest test confronting the creative production network firm is thusly the choice of the Could System that backings the association needs including Knowledge Transfer. Furthermore the integrity of the knowledge has risen to be one of the innovative supply chain firms' key concern. Therefore, proper process management techniques need to be followed for identifying the characteristics of the knowledge.

2.2 Characteristics and integrity of innovation knowledge:

Soliman (2012a, 2011a, 2011b) has shown that they integrity of knowledge must be based on sound knowledge Characteristics. The nine essential knowledge Characteristics are:

1. Appropriateness of information;
2. Currency of information;
3. Significance of information;
4. Authority for gaining information;
5. Goal of information;
6. Importance of information;
7. Approachability of staff to information;
8. Applicability of information, and
9. Fittingness of information to the application.

At the period of advancement of Cloud System, it is fundamental that the respectability of the framework be intended to guarantee a suitable level of inner control. The frameworks trustworthiness part should be centered around building up a hearty situation in which the advancement procedures will work. The advancement of the honesty environment ought to relieve the authoritative dangers of the development, and ought to guarantee that the controls actualized in the framework don't burden the business forms. In like manner the procedure trustworthiness part ought to be as control networks which address the accompanying framework traits, for example, Effectiveness; Efficiency;

Confidentiality; Relevance; Availability; Compliance; and Reliability (Soliman and Youssef, 2003a and 2003b). What's more the frameworks trustworthiness segment ought to be comprising of a segment for screening the learning exchanged. Numerous creators bolster the pattern of the developing ERP SaaS selection, noticing that it is anticipated that development to quicken as more organizations enter the advancement race to reinforce their upper hands. This implies development will advance quicken as ERP SaaS market develops. The test will be to guarantee that the cloud framework is centered around serving the development endeavors and in addition fulfilling other creative production network needs. This might be accomplished through the accompanying components:

1. Security while exchanging and saving information
2. Authenticating clients and administering access rights
3. Checking and confirming information exchanges
4. Reporting of use and information exchange measurements
5. Response times (e.g. to convey an information inquiry reaction or post an exchange)
6. Frequency, convenience and point of interest of execution reporting
7. Integration capacities for association with information suppliers inside and remotely.

In spite of the fact that confidences in Could Systems for inventive supply chain is developing there will even now the dangers that the cloud framework may not meet their association's norms in various territories:

- **Compliance:** Most endeavors have models set up for the security and uprightness of information, IT administration …etc. A gauge necessity is an acceptable those prerequisites.
- **Availability and performance:** Security of the information exchange ought to be additionally considered as demonstrative of the framework execution.
- **Functional richness and adaptability:** The cloud framework must offer the full broadness of usefulness that is fitting to the business.

2.3 Innovative Supply Chain firm willingness for Cloud System:

Research has found that in many companies, they are not prepared for adaption of Cloud System arrangement unless the accompanying key capacities are fulfilled:

- Integrated examination and adaptable reporting choices
- Flexibility to extend the application with a specific end goal to suit your necessities
- The on-interest arrangement implies that it requires no redesigns, upkeep or in advance capital expenses

- It is rapidly and effortlessly configurable, taking into consideration setup in as meager as 3 weeks
- Automate routine exercises and assignments so as to free up your staff's opportunity
- Simplify your IT operation with inherent administrations and backing
- Adapt to changes in your industry and business sector
- Support your endeavors to conform to moving national and universal regulations

Moreover a complete arrangement by coordinates the majority of the key business capacities, for example, HR, CRM, inventory network and acquisition through to cross-useful business procedures, is required keeping in mind the end goal to empower advancement learning to stream continuous over the development process. The incorporated investigation and reporting choices guarantee that you can exploit opportune and precise data conveyed in the right setting to each client, in view of their part. This gives the clients the data required to improve, very much educated business choices - and also expanding profitability and adequacy.

2.4 Important Factors for the Success of Cloud System Implementation:

Rockart (1979a, 1979b) defined CSFs as "for any business, the limited number of areas in which results, if they are satisfactory, will ensure successful competitive performance for the organisation". They are the few key areas where "things must go right for the business to flourish". According to Rockart (1979a and 1997b), "*Critical success factors are the factors that constitute the critical or fundamental components of the system*". They are the key areas where *things must go right*; in other words, if these components fail, the system fails (Soliman et. al., 2001).

The thought of distinguishing CSFs as a premise for deciding the data needs of administrators was proposed by Daniel (1961) however advanced by Rockart (1979a and 1979b). This implies in any association certain variables will be basic to the accomplishment of that association, as in if targets connected with the elements are not accomplished, the association will come up short. Rockart (1979 and 1979b) alluded to Daniel (1961), who gives the accompanying as a sample of the CSFs: "*new product development, good distribution, and effective advertising for the food processing industry - factors that remain relevant today for many firms*". Other scholars have used the CSF approach to optimize the operations of the implemented systems (Jamoo, 2008, Hong, 2001; Gide, 1999, Bergeron and Begin, 1989; Boyton and Zmud, 1984; Croteau and Li, 2003; Goldsmith, 1991; Leidecker and Bruno, 1984; Pollalis and Frieze, 1993). Different specialists have considered basic achievement variables of CRM mechanical activities, (Hong, 2001). Soliman et al. (2001) utilized basic achievement elements of execution of CAD/CAM in ERP environment and Nelson and Somers

(2001) gave a standout amongst the most broad surveys of basic achievement variable in ERP usage that as of now exists to date.

3.0 Theoretical framework

3.1 Current Management Problems with Cloud Implementation:

It is trusted that organizations set out on usage of Information Technology to encourage change. After the Cloud System execution and after work has been finished, the imaginative production network firm ought to look fundamentally the same to the Drucker's (1992) thought of data based associations. In this manner business techniques ought to be framed in view of Cloud System execution, and that Cloud System ought to be spoken to in the business procedures (King, 1994). Cloud System usage without innovative utilization of information exchange could be hard to execute and might fall flat. Appropriately, Scott (1995) contended that creative inventory network firms might require noteworthy changes to forms, as well as to the essential way chain is overseen. It ought to be noticed that Hall et al (1993) found that keeping in mind the end goal to take care of the issues that emerge from execution work, it is important to utilize demonstrated techniques to manage particular issues. These issues can extend from abnormal state key wanting to the point by point improvement of new sets of responsibilities. Certain instruments, for example, stream graphing or prepare mapping will probably repress as opposed to energize the inventive parts of re-building as noted by Vacca and Andrews (1994) and Soliman (1998). Likewise complex and steady executions of Cloud Systems should be produced.

3.2 Benefits from using Cloud Systems in Supply Chain firms:

In today's business atmosphere, the inventory network firm need a very versatile data framework and they should have the capacity to change or grow their frameworks rapidly and effectively, in light of new business and clients' requests. They likewise require programming and equipment that can work in conjunction with other programming and equipment in their association or augmented store network. These frameworks must have the capacity to develop with the production network firm and in the same time encourage an abnormal state of combination among information sources, (inward and outside) and business applications. It vital to say here that numerous associations have turned out to be more worried with the more extensive issues of gaining driving edge data frameworks and innovation which are adaptable and modest and the same time can deal with the undertaking business procedures and capacities. As a rule organizations that executed Cloud System did as such after broad and fruitful Business Process Re-Engineering exertion. Appropriately there is an expanding move toward corporate methodologies that incorporate the utilization of exhaustive specialized and arrangement situated frameworks.

Cloud System usage makes drastically distinctive working techniques to accomplish the request of greatness enhancements required. Moreover Cloud System execution encourages the change in corporate administration's impression of innovation. It is likewise affirming a substitute channel through which Information Technology arrangements are being examined and chose (Soliman, 1997).

While numerous researchers, for example, Jih et al (1995) recommended that administration ought to be taking a more all-encompassing way to deal with the upgrade and bundling of business procedures and their connection with Information Technology. The methodology created by the Cloud framework could be on a very basic level not the same as past methodologies where incremental enhancements were looked for. The explanation behind this is the conviction that radical upgrades in execution are both fundamental and achievable. This conviction is a driver for most inventive inventory network firms who looked to execute Cloud Systems. Executing non cloud frameworks applications is generally gone for computerizing the prior procedures in an association. Be that as it may, the could framework is methodology is meant to definitely enhancing the utilization of Information Technology and encouraging the rise of profitability, and augmenting the advantages of the present advances in Information Technology environment. As indicated by Soliman, (1997), it is to administration's greatest advantage to assess a few execution situations and see with their own eyes the benefits, inadequacies, usage issues and the expenses connected with each. In a perfect world, what is required is a monetary investigation of business procedures, and a quantitative assessment of the execution of the organization's business forms. Some type of defense to bolster business choices to upgrade and put resources into Information Technology is important to create certainty and eagerness in Information Technology venture choices (Soliman, 1997). It is significant that, numerous production network firms found that Cloud System execution is giving them the adaptability to take control of the business circumstance and offer clients a more extensive scope of administrations while streamlining forms, and controlling cost (Soliman, 2012b). Suppliers of business and framework joining administrations require suitable stages for creating and introducing the applications. They are confronting the test of incorporating innovation situated framework with business forms. The mapping of the proposed seven exploration theories and the related composite arrangements of components (CSFs) could turn out to be critical for upgrading the operations of the inventive store network firms.

4.0 Methodology and Research Model

Since there has been no distributed work found on CSF investigation of Cloud implementation in the writing at the season of this study, the proposed research model uses a percentage of the essential, surely understood and globally perceived past CSF contemplates in data frameworks (IS). Papers on CSFs study which have been counselled are those of Rockart (1979a, 1979b), Martin (1982), Miller

et al. (1987), McCredie and Updegrove (1999), Kuang et al., (2001) and Nelson and Somers (2001), Soliman et al. (2001), Jamoo, (2008) and Hong, (2001) and Gide, (1999).

The population will be the supply chain firms in Qatar. Self-administered questionnaire will be used in this study to collect primary data. The questionnaire consists of six sections which will collect the necessary information pertaining to this study. Most of the questions were closed with rating scales. This means that respondents will provide with a range of multiple answers for each question. Descriptive analysis (frequencies, percentages, and means) and inferential analysis (factor analysis, correlation, one-way ANOVA, independent sample t-test and multiple regressions) will be employed to analyse the data using the latest SPSS version. Prior to the study, a pilot test was conducted to ascertain the validity and reliability of the measurement used. The pilot test was conducted a mong 10 firms who were adopting the system. The overall pilot test showed that there was no major change or revision needed.

4.1 Hypothesis

In this study, it is proposed that the five sets of hypotheses that are likely to impact on success or otherwise of Cloud Systems implementation in Qatari firms will be identified. The variables are tentatively selected from various IT/IS related literature. Those factors will need to be verified by a panel of Focus groups. The five potential factors are follows:

1. Selection of the Cloud framework (equipment, programming and system);
2. Management responsibility and backing;
3. Implementation's viability;
4. Users' preparation; and
5. Technological skill.

After check from the Focus Group, it is conceivable to recommended that the provisional applied examination model will comprises of five hypothesis for this exploration are as planned underneath:

H1: **The determination of the Cloud System for implementation** is emphatically identified with Cloud System usage achievement.

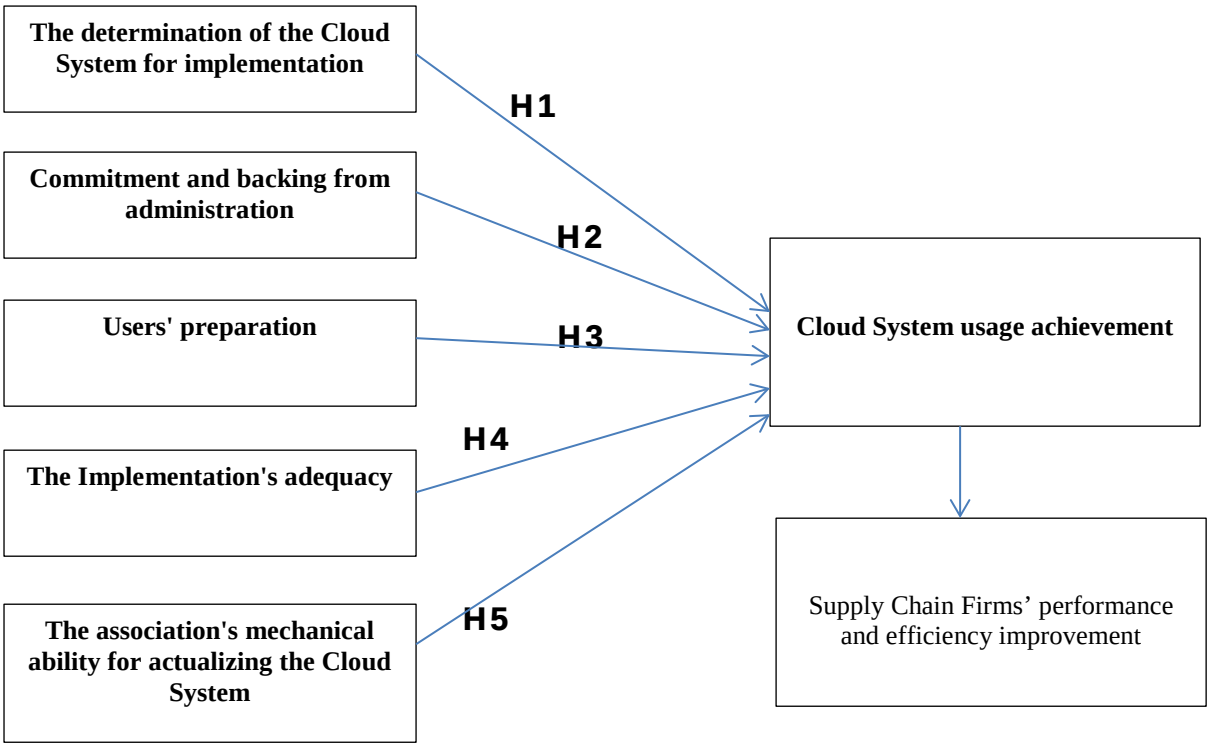
H2: **Commitment and backing from administration** are identified with Cloud **system** usage achievement.

H3: **Users' preparation** is emphatically identified with Cloud System **usage** achievement.

H4: **The Implementation's adequacy** is absolutely identified with Cloud **s**ystem usage achievement.

H5: **The association's mechanical ability for actualizing the Cloud System** is absolutely identified with Cloud System usage achievement.

4.2 Research proposed Model



Indeed, this study is proposed to give both hypothetical and pragmatic new bits of knowledge into the execution of a Cloud System as a vital information administration apparatus. A Cloud System usage is intricate and includes various diverse equipment, programming and foundation setup. It is foreseen this examination will indicate various variables that can add to the accomplishment of a Cloud Systems usage as a key information administration instrument in the chose creative inventory network as well as in different associations. It is trusted that the structure introduced in this examination and the discoveries displayed could frame a base essential hypothesis that can help facilitate improvement in Cloud System research. It is foreseen this study could convey significant bits of knowledge to help associations that are considering the execution of a Cloud System.

	N	44	44	44	44	44	44
The Implementation's	Pearson Correlation	.404**	.302**	.272**	1	.383**	.231**

adequacy	Sig. (2-tailed)	.000	.000	.001		.001	.000
	N	44	44	44	44	44	44
The association's mechanical ability for actualizing the Cloud System	Pearson Correlation	.273**	.301**	.537**	.302**	1	.262**
	Sig. (2-tailed)	.001	.001	.000	.000		.000
	N	44	44	44	44	44	44
Cloud System usage achievement	Pearson Correlation	.455**	.539**	.537**	.252**	.627**	1
	Sig. (2-tailed)	.001	.001	.000	.000	.001	.
	N	44	44	44	44	44	44

**. Correlation is significant at the 0.01 level (2-tailed).

The correlation coefficient for each pair of variables appears at the intersection of one variable's row and the other variable's column. Each variable correlates perfectly with itself, as evidenced by the coefficients of +1.00 at the intersection of a particular variables' row and column. The association's mechanical ability for actualizing the Cloud System correlates strongly with the Cloud System usage achievement (rXY = +.627). A moderate correlation exists between the Commitment and backing from administration and the Cloud System usage achievement (rXZ = +.539) as well as between the Users' preparation and the Cloud System usage achievement (rYZ= +.537). The fact that all of these correlation coefficients have positive values indicates that increases in one variable correspond to increases in the other.

Likert Scale

Opinion	Weight mean	Opinion
Strongly disagree	From 1.00 to 1.85	Very low
Disagree	From 1.86 to 2.71	Low
Slightly disagree	From 2.72 to 3.57	Slightly low
Neither disagree nor agree	From 3.58 to 4.43	Moderate
Slightly agree	From 4.44 to 5.29	Slightly high
Agree	From 5.30 to 6.15	High
Strongly agree	From 6.16 to 7.00	Very high

6.0 Conclusions

This study contributes to the literature and the practice of supply chain firms' managers in Qatar by presenting the following conclusions:

1. The cloud system adoption by supply chain firms in Qatar has a positive influence on performance and efficiency improvement.
2. The selected factors such as The association's mechanical ability for actualizing the Cloud System , the Commitment and backing from administration and the Users' preparation to be more important to adopt cloud systems by supply chains firms in Qatar than other factors.
3. Some of the factors in cloud system adoption, appear to be more important to success than other factors.

4. The findings suggest that the effect of cloud system adoption on supply chain firms' profitability is indirect, mediated by other factors.
5. The cloud system adoption can remove many of the competitive advantages of larger enterprises in Qatari market and provide opportunities for supply chain firms.
6. Top management in supply chain firms realized the importance of cloud system adoption form, hence, supply chains in Qatar are forced to adopt cloud systems.
7. Results conclude that it is very believable that the cloud system adoption will condition minimal expenses (costs reduction) e.g. acquisition of simple technological equipment and employees training to use the system, etc.
8. The benefits of cloud system adoption in supply chain firms include the effective way for supply chain firms in Qatar to sell and advertise their products and services, improve communications with their TPs identify potential TPs.
9. Results that have been discussed and presented earlier conclude that the cloud system adoption is important for the ongoing survival of supply chain firm and innovation in Qatar.

This study clarifies the literature through four contributions: The main contribution is to extend previous research by being the first study to develop a continuous scale or model specifically measuring the cloud system adoption and usage by supply chain firms in the services and industrial sectors in Qatar, which resulted in a strong positive influence and correlation in supply chain firms' performance and efficiency improvements.

Abstract

The aim of this study is to examine the user engagement in the context of digital libraries. The assessment is based on six interrelated constructs which are endureability, perceived usefulness, focus attention, felt involvement, aesthetics and novelty. Adopting a survey research method and a paper-based questionnaire as the instrument for data collection, a total of 299 participated in the study. Using the Structural Equation Modeling approach as the data analysis technique, the results showed that, endurability is jointly determined by perceived usability, felt involvement, and focused attention. The esthetic and novel is also found to have a significant effect on felt involvement and focused attention.

Keywords: user assessment, user engagement, usability, digital library

Introduction

As library collections are increasingly dominated by online content, the concepts of 'digital libraries' and 'libraries' are less distinguishable than they were in the 1990s, when digital libraries began to emerge (Calhoun, 2014). Since its inception, the digital library have led to the rapid growth in the availability of open, freely available digital content. Smith (2001) defined a digital library as an organized and focused collection of digital objects, including text, images, video and audio, with the methods of access and retrieval and for the selection, creation, organization, maintenance and sharing of collection.

Research on the assessment of the digital library has been mainly revolving around adoption and usability, giving less attention on user engagement. While engagement, to a certain extent, can be equated to usage, it is however, goes beyond that, and can include multiple dimensions focusing on affective, cognitive and behavioral (O'Brien & Toms, 2010). User engagement is also attributed to users' attitudes toward systems (e.g., usability, aesthetic appeal) and focuses on individual users' thoughts, feelings and their degree of activity during system use (O'Brien & Toms, 2013). According to Green et al., (2015) user engagement is increasingly acknowledged to be critical to the value of digital collections.

Dervin (1998) stated that user engagement in information searching is not only a process of retrieval, but also a process of sense or meaning construction, in which users make sense their current situation with knowledge, ideas, opinions, or effective interactions. Xu (2015) opined that it is necessary to explore the concept user engagement for the better understanding of users' information search process and sense making. This is also essential for the better understanding on the interaction between information users and digital library designer. Given the dearth of studies on user engagement in the context of digital library, this study was an attempt to fill this gap.

Theoretical Framework

Figure 1 depicts the research model used in the study. It was developed by O'Brien and Toms (2010) based on the user engagement with on-line shopping. The model consists of six interrelated constructs, namely, endurability, perceived usefulness, felt involvement, focused attention, aesthetics and novelty. The operational definition of the constructs is given in Table 1. According to O'Brien and Toms (2010), the model consists of distinct stages characterized by the presence of specific attributes. The point of engagement occurs when the user decides to invest in the interaction and it is precipitated by the aesthetic or novel aspects of the interface that work to capture users' attention and interest.

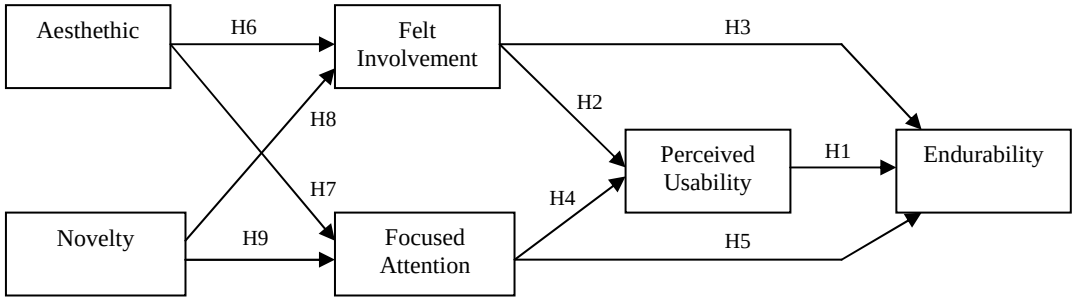

Fig. 1. Theoretical Framework adopted from O'Brien & Toms (2013).

Table 1. Operational definition of ISCM constructs

Constructs in ISCM	Operational Definition	Corresponding Hypotheses
Endurability	The assessment of users' perception of success with a task, and their willingness to use an application in the future or recommend it to others	-
Perceived Usability	Users' affective (e.g., frustration) and cognitive (e.g., effort) responses to the digital library.	*H1: Perceived Usability significantly predicts endurability*
Felt Involvement	Users' feelings of being drawn in, interested, and having fun during the interaction with the digital library	*H2: Felt involvement significantly predicts perceived usability* *H3: Felt involvement significantly predicts endurability*
Focused Attention	The concentration of mental activity contained some elements of flow, specifically focused concentration, absorption, and temporal dissociation	*H4: Focused attention significantly predicts perceived usability* *H5: Focused attention significantly predicts endurability*
Aesthetic	The assessment of user's perception regarding the interface, such as the screen layout and graphics/images. It also measures users' overall aesthetic impressions of the digital library attractiveness and sensory appeal	*H6: Aesthethic significantly predicts felt involvement* *H7:Aesthethic significantly predicts focused attention*
Novelty	The assessment of the user's perception of the extent that the digital library stimulates curiosity. It also gauges experience in the form of surprises, unexpected, or new information at various points in time.	*H8: Novelty significantly predicts felt involvement* *H9:Novelty significantly predicts focused attention*

Research Methods

The study used a survey research method with a paper-based questionnaire as the instrument for data collection. The questionnaire was designed based on the instruments used by previous studies. Perceptual measures in the form of statements were used for measuring each construct with a corresponding Likert scale anchored as 1 for "Strongly Disagree"; 2 for "Disagree"; 3 for "Neither Agree Nor Disagree"; 4 for "Agree" and 5 for "Strongly Agree". The questionnaire was pre-tested with several experts and prospective respondents. Consequently, it was pilot test was carried out with 30 students. The results of the pilot indicated that the questionnaire was acceptably reliable because the Cronbach Alpha for all construct surpassed the 0.7 mark. The population of the study was students of the Faculty of Information Management, Universiti Teknologi MARA, Malaysia. Using the simple random sampling technique, a total of 400 questionnaires distributed to targeted students. A total of 352 questionnaires was returned, and upon further scrutiny, 53 had to be dropped from further analysis because more than 20% of the questionnaire were not answered. Statistical software named SPSS and AMOS version 22 were used for the data analysis. The SPSS were used for data entering (coding), descriptive analysis and common method bias analysis. The AMOS version 22 was used for Structural Equation Modelling (SEM).

Findings

Demographic Profile

Out of 299 respondents who participated in the study, 75.6% equivalent to 226 respondents were female. A total of 230 equivalent to 76.9% stated as pursuing undergraduate programs while the remainder were postgraduate programs, either at Masters or Phd.

Common Method Bias and Normality Assessment

As this research used single respondent to answer all questions in the questionnaire, therefore, the presence of common method bias is inevitable. To examine whether such threat is really presence, the Harman's single factor test was executed. The result showed that that the total cumulative variance is 30.261% which is less that the suggested score of not more than 50%. The results implied that the questionnaire use in the study is free from common method bias. Given that SEM requires that the data need to be univariately and multivariately normal, the skewness and kurtosis for all items were therefore examined. The results showed that all items scored are not more than the suggested value of 3 and 10 respectively. The multivariate normality test was executed by comparing the Mardia's score with p (p+2), where p is the observed variable, and in this study it is 20. The Mardia's score obtained in the study is 32.95 which is less than 440 suggesting that multivariate normality can be assumed.

Measurement Model (Confirmatory Factor Analysis)

Prior to testing the formulated hypotheses, a measurement model was developed as assessed. The diagram used in the analysis is presented in Figure 2. Table 2 shows the factors loading for item measuring construct. The majority of the factors loading is above 0.7 marks. Only five items has factor loading less than 0.7. One item has factor loading above 0.8.

Table 2. Factors Loadings of Items Measuring Constructs

Constructs	Item code	Item	Loading
Endureability	EN1	Resource finding in the digital library website is very rewarding	0.724
	EN2	Resource finding in the digital library website has always been successful	0.703
	EN3	I will always use the digital library website to find academic resources	0.724
	EN4	I will always recommend to my colleague to use the digital library website	0.722
Perceived Usability	PU1	The digital library website is well designed to find what I want	0.739
	PU2	I can complete a resource-finding task quickly using the digital library website	0.738
	PU3	The digital library website is easy to use to perform my search tasks	0.714
	PU4	Using the digital library wesbite has never been frustrating for me	0.641
Felt Involvement	FE1	When using the digital library website, I was really drawn to my resource finding task	0.773
	FE2	I felt fully involved in resource finding when using the digital library website	0.752
	FE3	Resource finding task using the digital library website was fun	0.694
Focused attention	FO1	I forgot about my immediate surroundings while using the digital library websites	0.679
	FO2	I lost track of time while using the digital library website	0.737
	FO3	I was so involved in using the digital library website that I ignored everything around me.	0.748
Aesthetic	AE1	The digital library website was attractive	0.690
	AE2	The digital library website was visually appealing	0.814
	AE3	I liked the graphics and images used in the digital library websites	0.735
Novelty	NO1	I continued using the digital library websites out of curiosity	0.691
	NO2	The content of the digital library website incites my curiosity	0.710
	NO3	I felt more interested with my resource finding when using the digital library website	0.721

SEM requires the assessment of convergent validity and discriminant validity. To fulfill this requirement, the Composite Reliability (CR), Average Variance Extracted (AVE), Maximum Shared Variance (MSV), and Average Shared Variance (ASV) were measured. The reliability assessment requires that the Composite Reliability (CR) is above 0.7. The convergent validity requires that the Average Variance Extracted (AVE) is above 0.5. The discriminant validity is achieved when the Maximum Shared Variance (MSV) is less than Average Variance Extracted (AVE); the Average Shared Variance (ASV) is less than Average Variance Extracted (AVE) and the square root of AVE greater than inter-construct correlations. Table 3 shows the results of the convergent validity test while Table 4 presents the results of the discriminant validity test.

Table 3. Factor Loadings of Items Measuring Constructs

	Composite Reliability (CR)	Average Variance Extracted (AVE)	Maximum Shared Variance (MSV)	Average Shared Variance (ASV)
Focused Attention (FO)	0.765	0.521	0.278	0.193
Aesthetic (AE)	0.791	0.560	0.206	0.104
Novelty (NO)	0.750	0.500	0.304	0.211
Perceived Usefulness (PU)	0.801	0.503	0.318	0.176
Felt Involvement (FE)	0.784	0.548	0.304	0.191
Endureability (EN)	0.810	0.516	0.318	0.268

Table 4. Results of Discriminant Validity Assessment

	FO	AE	NO	PU	FE	EN

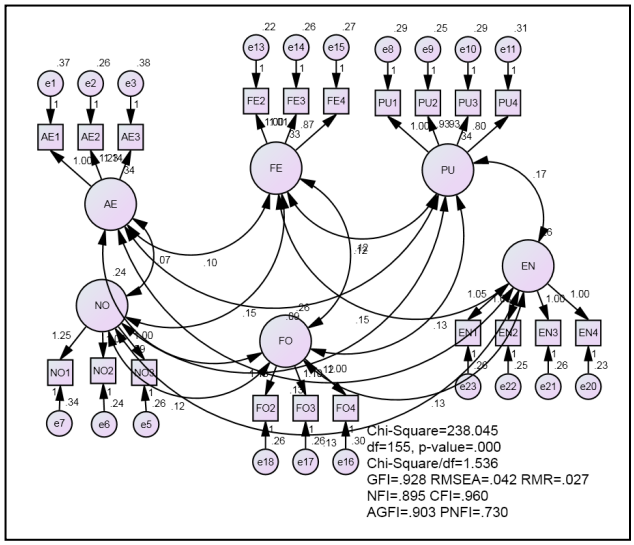

Fig. 2. Measurement Model

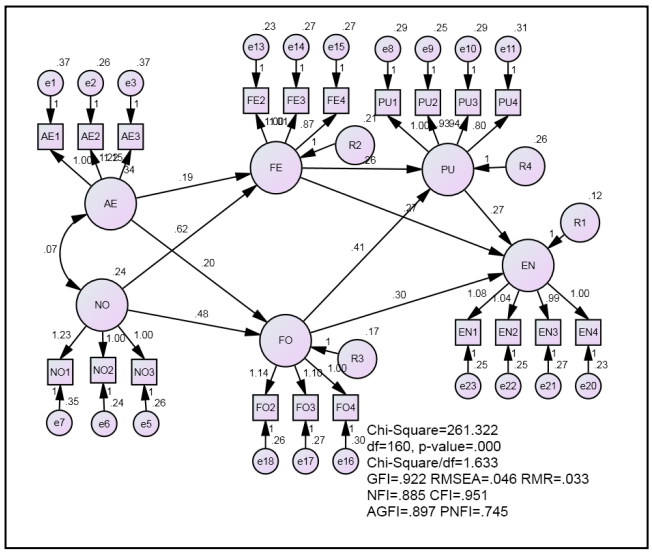

Fig. 3. Structural Model

SEM analysis requires that the measurement model being developed fulfilled the fit criteria. In other words, the measurement model that has been developed must meet several fit criteria as stated by Hair et al. (2010).. The measurement model is regarded as acceptable when p-value of the Chi-square is above 0.05; the discrepancy divided by the degrees of freedom is less than 3.00; the Goodness of Fit Index (GFI), the Normed Fit Index (NFI) and the Comparative Fit Index (CFI) are above 0.9; the Root Mean Square Error of Approximation (RMSEA) and Root Mean Square Residual (RMR) are less than 0.05; the Adjusted Goodness of Fit Index (AGFI) is above 0.8 and Parsimonious Normed Fit Index (PNFI) is above 0.5. As illustrated in Table 5, most of the fit criteria are fulfilled in the measurement model.

Table 5. Fit Indices of Measurement and Structural Model

Fit Index	Fit Criteria	Measurement Model
Chi Square ($\chi^{2)}$		261.322
Degrees of freedom		160
P-value (probability)	≥ 0.5	0.000
Absolute fit measures		
CMIN (χ^2)/DF	3	1.633
GFI (Goodness of Fit Index)	≥ 0.9	0.922
RMSEA (Root Mean Square Error of Approximation)	≤ 0.05	0.046
RMR (Root Mean Square Residual)	≤ 0.05	0.033
Incremental fit measures		
NFI (Normed Fit Index)	≥ 0.9	0.885
CFI (Comparative Fit Index)	≥ 0.9	0.951
Parsimony Fit Measures		
AGFI (Adjusted Goodness of Fit Index)	≥ 0.8	0.897
PNFI (*Parsimonious Normed Fit Index)*	≥ 0.5	0.745

Structural Model (Hypotheses Testing)

In order to test the hypotheses, structural model was developed and assessed as shown in Figure 3. Table 6 presents the results of the analysis. As shown in the table, the p-values are significant either 0.01 or 0.001 level, hence suggesting that all established hypotheses in the study are fully supported.

Table 6. Results of Hypothesis Testing

	Estimate	S.E.	C.R.	P	Hypotheses supported?
H1: PU → EN	.270	0.064	4.206	0.000	Yes
H2 :FE → PU	.255	0.080	3.188	0.001	Yes
H3: FE → EN	.272	0.064	4.236	0.000	Yes
H4: FO → PU	.410	0.095	4.306	0.000	Yes
H5: FO → EN	.296	0.079	3.762	0.000	Yes
H6: AE → FE	.193	0.070	2.771	0.006	Yes
H7: AE → FO	.197	0.064	3.053	0.002	Yes
H8: NO → FE	.619	0.100	6.219	0.000	Yes
H9: NO → FO	.483	0.084	5.713	0.000	Yes

Discussion

The main aim of the study has been to examine user engagement in the content of web digital library. To achieve this aim, a model developed by O'Brien and Toms (2010) was adopted. The results showed that perceived usability ($\beta = 0.270$, $p < 0.05$), felt involvement ($\beta = 0.272$, $p < 0.05$), and focused attention ($\beta = 0.296$, $p < 0.05$), are a significant predictor of endurability. The presence and an increased in these three factors will sparingly increase the endurability. Felt involvement ($\beta = 0.255$, $p < 0.05$), and focused attention ($\beta = 0.410$, $p < 0.05$), are also found to have significant effect on perceived usability. As the users feel that their involvement and attention to the digital library increases, their perception of the usability of the digital library will also increase. Both aesthetic and novel jointly predict felt involvement and focused attention. The finding reveals that the relationship between the novel and other constructs scored the highest reading as compared to other relationships in the model. The finding signifies the importance of novelty in a digital library content.

Conclusion

The purpose of this article has been to examine the user engagement in the context of digital. To achieve this purpose, an empirical based framework drawn from the work of O'Brien and Toms (2010) has been developed. The model consists of six interrelated constructs which are endureability, perceived usefulness, focus attention, felt involvement, aesthetics and novelty. The results of the analyses, fully support all the established hypotheses connecting these constructs.

There are several limitations associated with the conduct of this study. Firstly, is the sample who participated in the study were students confined to one university only. Future study, should consider extending the scope of the population by engaging students from other universities. Another limitation of this study is that it examined one digital library only. Hence, although statistically significant relationships are reported, caution is recommended in generalizing these results to other contexts.

Acknowledgement

The researcher would like to extend his thanks to the students of the Faculty of Information Management, Universiti Teknologi MARA who had willingly participated in this study. Special thanks are also owed to Faculty of Information Management, Universiti Teknologi MARA for providing all the necessary resources required for the completion of the study.

Abstract

The current study examines the antecedents of recovery satisfaction among 338 customers who experienced service failures at casual restaurants in Malaysia. Data was analyzed using Covariance-Based Structural Equation Modelling (CB-SEM) technique via the utilization of Analysis of Moments Structures (AMOS). Findings indicate that distributive justice, procedural justice, and interactional justice were significantly related to customers' post-recovery satisfaction. Interactional justice demonstrates the strongest effect on recovery satisfaction compared to the other two dimensions. The study has enhanced the understanding of the antecedents of recovery satisfaction and has implications for marketing researchers and restaurateurs. It also confirms the appropriateness of justice theory in examining service recovery efforts performed by the restaurateurs. Further suggestions for future research are offered.

Keywords: service recovery, satisfaction, restaurant industry, structural equation modelling

Introduction

Customers and service providers are unable to anticipate service failure during the exchange process. Service failure could occur anytime and the service provider's manner in handling it will determine the subsequent behaviour of the customers. Thus, it is vital for the service provider to minimize the occurrence of service failure as this negative incident may tarnish the reputation of the company. A proper response plan is crucial to recover from service failure (Vázquez-Casielles, Suárez Álvarez, & Díaz Martín, 2010). Immediate service recovery can save the upset customers from switching to the competitors. Recent trend in marketing research demonstrates that focus has been directed to variety of conceptual models, methodological approaches, and industry settings pertaining to service recovery studies. However, the researchers believe that there is room for further service recovery research and the restaurant industry was selected for this study due to several reasons. Zulhan, Mohd Salehuddin, and Salleh (2013) highlighted that service failure was one of the main problem faced by most restaurateurs in Malaysia. The nature of restaurant industry that involved a high degree of interaction between the customers and the employees make service failure susceptible to happen. As the current study focuses on casual restaurant in Malaysia, it was claimed that this type of restaurant continues to be one of the most popular choices of foodservice providers in Malaysia (Salim, Rahmat, Chinna, & Kumar, 2009). Malaysian restaurant industry also has experienced a great development with the mushrooming of restaurants for the past ten years (Zulhan et al., 2013). Additionally, the family friendly atmosphere and reasonable prices offered by the casual restaurant (Hwang & Ok, 2013; Parpal, 2013) has attracted customers to dine at this type of restaurant compared to others.

Service recovery

Service recovery is an immediate action taken by the service provider to reduce the level of dissatisfaction following a service failure (Andreassen, 2000; Waqas, Ali, & Khan, 2014). Service recovery is designed to effectively rectify the problem experienced by the customers. As a result, the

customers can be returned to the state of satisfaction and it will lead to positive behavioral intentions (Miller, Craighead, & Karwan, 2000). Service recovery should be a part of restaurant's customer service culture as extant studies claimed that it is one of the critical success factors for any service organizations (Keeffe, Russell-Bennett, & Tombs, 2007). Service recovery strategies should be carefully designed as it may lead to positive or negative consequences. Service recovery paradox (Smith & Bolton, 1998) is a term used to describe positive consequences of service recovery. According to service recovery paradox, the level of customer satisfaction will be higher after their problem is taken care of compared to those who never encountered problem with the service provider (Michel & Meuter, 2008). Service recovery paradox exists whenever the level of customer satisfaction, repurchase intentions, and positive word of mouth are higher than those who never experienced service failure (McCollough & Bharadwaj, 1992). The existence of service recovery paradox has been proved in the studies conducted by Maxham and Netemeyer (2002), Boshoff (1997), and Smith and Bolton (1998). On the contrary, double deviation (Smith & Bolton, 1998) is a term used to describe the negative consequences of poor service recovery. Double deviation occurs whenever customers experienced a service failure and followed by a poor service recovery (Casado-Díaz, Más-Ruiz, & Kasper, 2007). Double deviation is a serious threat as the frustrated customers will become more dissatisfied and it can lead to customer defection (Smith & Bolton, 1998; Tax & Brown, 1998).

In this study, service recovery was examined based on three dimensions of justice theory namely distributive justice, procedural justice, and interactional justice. Previous research claimed that justice theory has been regarded as one of the main point of references in service recovery studies (Lin, 2012; Prasongsukarn & Patterson, 2012; Wen & Chi, 2013). Justice theory emerged from the combination of equity theory (Adams, 1965) and social exchange theory (Homans, 1961). According to equity and social exchange theories (Adams, 1965; Bagozzi, 1975; Homans, 1961), the amount of input should be equal to the outcome to be considered as a fair exchange. An unfair exchange will occur if the customers perceived that the outcomes that they received is not equal to what they have paid to the service providers. Additionally, mutual relationship can only be established if both parties perceived that the exchange is fair.

Distributive justice

Distributive justice is defined as the outcomes that the customer received as a result of service recovery (McColl-Kennedy & Sparks, 2003). The outcomes may consist of providing a replacement for an incorrect meal, discount for a slow service, cash refund for a defect product, or voucher for the next visit. The purpose of distributive justice is to reduce customer dissatisfaction by providing a something that is equal to the amount of loss. Distributive justice is also considered as a tangible replacement or monetary rewards that the customer should receive due to service failure (Río-Lanza, Vázquez-Casielles, & Díaz-Martín, 2009). Distributive justice is one of the critical aspects that should be focused in performing service recovery as it can lead to recovery satisfaction and future behavioral intentions (such as repeat purchase, positive word of mouth and loyalty). Preceding studies by Nikbin, Ismail, Marimuthu, and Jalalkamali (2010), Prasongsukarn and Patterson (2012), Ha and Jang (2009), and Ok (2004) found that distributive justice positively influences recovery satisfaction in various industry settings. Therefore, the following hypothesis is proposed based on the aforementioned discussion:

H1: Distributive justice positively influences recovery satisfaction.

Procedural justice

Procedural justice is described as the processes, procedures or functions that involved during the attempt to recover from the service failure (Dong, Evans, & Zou, 2008; Mattila, 2001). It may also concern with the amount of time taken to solve the problem (Smith, Bolton, & Wagner, 1999; Wirtz & Mattila, 2004), follow-up process (Patterson, Cowley, & Prasongsukarn, 2006), and flexibility of the complaint procedures (Smith et al., 1999). Procedural justice is essential in service recovery as dissatisfied customers expect their problem to be resolved immediately with less-hassle procedures. Therefore, the service provider needs to ensure that their service recovery procedures are flexible as

each customer's problem is unique. Extant studies demonstrate that upset customers can be remedied if the service providers are able to react to their problem in a timely manner. Consistent with the studies conducted by Chang and Chang (2010), Wirtz and Mattila (2004), Maxham and Netemeyer (2002), and Lii, Pant, and Lee (2012), it was found that a higher level of procedural justice can lead to an increase in customer's post recovery satisfaction. Based on the preceding discussion, the following hypothesis is derived:

H2: Procedural justice will positively influences recovery satisfaction.

Interactional justice

Interactional justice concerns with the interaction process that takes place during service recovery (Sparks & McColl-Kennedy, 2001). It includes the act of politeness, empathy, and respect by the service providers in resolving the problem (Goodwin & Ross, 1992; Ha & Jang, 2009; Smith et al., 1999). Service providers should be more vigilant when dealing with frustrated customers as poor service recovery may lead to a more serious problem (or double deviation). A courteous or polite reply to customer's complaint may calm the customers and previous studies postulate that such manners can lead to positive consequences. Studies performed by Wirtz and Mattila (2004), Andreassen (2000), Lii et al. (2012), and Nikbin et al. (2010) found that interactional justice was an antecedent to recovery satisfaction. Due to this notion, the following hypothesis is proposed:

H3: Interactional justice positively influences recovery satisfaction.

Based on the aforementioned discussion on distributive justice, procedural justice, and interactional justice, the following conceptual framework (Figure 1) is proposed to be examined for the current study:

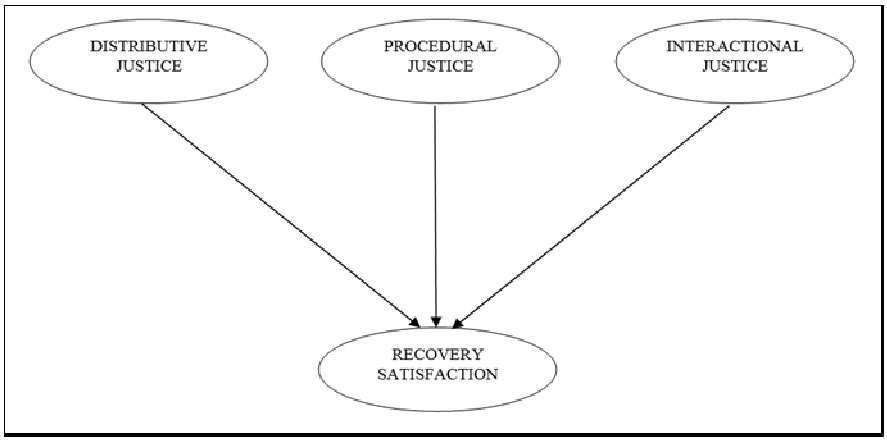

Figure 1: Conceptual framework of the study

Methodology

A total of 400 questionnaires were distributed to respondents in the metropolitan areas of Kuala Lumpur, Selangor, Penang, and Johor in Malaysia. These areas were selected due to the rapid establishment of restaurant premises in recent years as reported by Euromonitor International (2013). A non-probability purposive sampling technique was used for data collection due to the notion that the occurrence of service failure cannot be anticipated and the utilization of probability sampling will only result in small number of sample size (Schoefer & Ennew, 2005). Out of 400 distributed questionnaires, 62 questionnaires were discarded due to problems such as outliers, missing values, and straight-linings (Hair, Black, Babin, & Anderson, 2010; Hair, Hult, Ringle, & Sarstedt, 2014; Sekaran & Bougie, 2010). The respondents were only eligible to answer the questionnaire if they have experienced service failure and recovery within the past one year (to avoid memory bias). A few

screening questions were asked in the questionnaire to ensure the eligibility of the respondents. The items for the questionnaire were adapted from previous research with minor modifications to cater for the current study context. The items for distributive justice, procedural justice, interactional justice, and recovery satisfaction were adapted from Blodgett, Hill, and Tax (1997), Maxham and Netemeyer (2002); Smith et al. (1999); Vázquez-Casielles, Suárez Álvarez, and Díaz Martín (2010), and Río-Lanza et al. (2009). A 5 point Likert scale anchored at 1 = strongly disagree and 5 = strongly agree was used in the questionnaire. The data was later analyzed using Covariance-Based Structural Equation Modelling (CB-SEM) approach via the utilization of Analysis of Moment Structures (AMOS) version 21. AMOS was employed due to its capability to analyze the hypothesized relationship simultaneously and the software is appropriate for theory confirmation (Byrne, 2010; Hair et al., 2010).

Results

The model was empirically tested using AMOS version 21. Generally, the SEM model can be decomposed into two sub-models: a measurement model, and a structural model (Byrne, 2010). The measurement model was first tested before the structural model. The following sub-sections will further discuss the assessment of both sub-models.

Measurement model

The measurement model should be assessed before the researcher can proceed to examine the relations among the unobserved variables (latent constructs). The purpose of analyzing the measurement model is to provide support for the issues of dimensionality (the relations between observed and unobserved variables), convergent, and discriminant validity (Byrne, 2010; Hair et al., 2010). Table 1 summarizes the results of internal reliability and convergent validity for all the constructs. The purpose of convergent validity is to demonstrate that the indicators of a specific construct should share a high proportion of variance in common (Hair et al., 2010). Thus, convergent validity was examined based on factor loadings, average variance extracted (AVE), and composite reliability (CR) (Fornell & Larcker, 1981; Hair et al., 2010).

The assessment of modification indices were also performed. It was revealed that the fit of the model could be further improved by eliminating several cross-loading items. Accordingly, cross-loading items were eliminated one at a time, starting with the one displaying the highest modification index. As a result, 1 item was dropped from both distributive and interactional justice, and 2 items were dropped from recovery satisfaction. A significant improvement in fit was noted with the value for Chi-square = 280.290; Chi-square /*df* =2.480; GFI (good-fit-index) = 0.910; AGFI (adjusted good-fit-index) = 0.878; CFI (comparative-fit-index) = 0.965; RMSEA (root mean square error of approximation) = 0.066. Additionally, the factor loading for all items in this study exceeded the recommended level of 0.7 (Hair et al., 2010) and the CR values were above 0.7 (Gefen, Straub, & Boudreau, 2000). The AVE for all constructs exceeded the suggested value of 0.5 and the values for Cronbach's Alpha were all more than 0.7 (Hair et al., 2010; Nunally, 1978). Thus, it can be concluded that the measurement model fitted the data well based on the guidelines recommended by Hair et al. (2010).

Table 1: Convergent validity

Construct	Factor Loadings	AVE	CR	Cronbach's Alpha
Distributive justice		0.70	0.921	0.922
The restaurant compensated me adequately to solve the problem.	0.79			
The restaurant put proper effort into offering a satisfactory compensation.	0.81			
I think the restaurant was fair when compensating me for the problem that occurred.	0.84			

In resolving the problem, the restaurant gave me what I deserved.	0.86			
The compensation I received was right.	0.88			
Procedural justice		0.621	0.868	0.867
I think the restaurant has good policies and practices for dealing with problems.	0.77			
Despite the hassle caused by the problem, the restaurant was able to respond in a timely manner.	0.84			
The restaurant tried to solve the problem as quickly as possible.	0.76			
I believe the restaurant's complaint handling procedure was adequate.	0.78			
Interactional justice		0.681	0.914	0.915
The restaurant employees were appropriately concerned in my problem.	0.85			
The restaurant employees did everything possible to solve my problem.	0.89			
The restaurant employees were honest when dealing with my problem.	0.83			
The restaurant employees showed enough authority to solve the problem.	0.80			
The restaurant employee's communication with me were acceptable when solving the problem.	0.75			
Recovery satisfaction		0.812	0.968	0.927
I am satisfied with the way my problem was dealt with.	0.93			
I am happy with the way my problem was solved.	0.94			
In my opinion, the restaurant provided a satisfactory solution to this particular problem.	0.83			

Consequently, discriminant validity was performed to examine the degree to which the construct is truly different from other constructs (Hair et al., 2010). Discriminant validity can be assessed by comparing the correlations between constructs and square root of the AVE for a construct (Fornell & Larcker, 1981). The results in Table 2 indicate that the correlations for each construct was smaller than the square root of the AVE. Diagonals represent the square root of the AVE while the other entries represent the correlations. Thus, discriminant validity was achieved. Overall, the measurement model demonstrated adequate reliability, convergent validity, and discriminant validity.

Table 2: Discriminant validity of constructs

Construct	1	2	3	4
1. Distributive justice	**0.837**			
2. Procedural justice	0.755	**0.788**		
3. Interactional justice	0.604	0.780	**0.825**	
4. Recovery satisfaction	0.704	0.784	0.761	**0.901**

Structural model

The structural model was analyzed using AMOS through path analysis. All the fit indices were above the recommended values. The value of Chi-Square = 280.290; Chi-Square/*df* = 2.480; AGFI = 0.878, GFI = 0.910, CFI = 0.965, TLI = 0.958, RMSEA = 0.066. According to Table 3, H1 demonstrates a significant positive relationship between distributive justice and recovery satisfaction. Hypothesis 1 was therefore supported. Path analysis between procedural justice and recovery satisfaction demonstrates a positive significant relationship. Hypothesis 2 was therefore supported. Hypothesis 3 suggested that interactional justice is positively related to recovery satisfaction. Path analysis provided empirical support for the significant positive relationship between the two constructs. Hypothesis 3 was therefore supported. The R^2 value for the relationship between the independent variables and recovery satisfaction was 0.70 which indicates that 70% of the variance in recovery satisfaction can be explained by all three dimensions of service recovery.

Table 3: Summary of the structural model

Path	**Hypothesis**	**Path coefficient**	***t*-Value**	**Decision**
Distributive justice -> Recovery satisfaction	H1	0.248	3.990***	Supported
Procedural justice -> Recovery satisfaction	H2	0.307	3.497***	Supported
Interactional justice -> Recovery satisfaction	H3	0.371	5.466***	Supported
$R^2 = 0.70$				

**p < 0.05, **p < 0.01, *** p < 0.001*

Discussion and conclusion

The results obtained from the structural model indicate that the current study has a relatively good model fit with an R^2 of 0.70. The empirical results demonstrate that distributive, procedural, and interactional justice were positively related to recovery satisfaction. Thus, all the hypothesized relationships were supported. The results are consistent with preceding studies conducted by Lii et al. (2012), Wirtz and Mattila (2004), and Patterson et al. (2006). The results indicate the critical role of service recovery in ensuring customer satisfaction as it can lead to positive behavioral intentions. Service recovery is indeed a remedy to save upset customers and if properly executed, the customer's level of satisfaction could be higher compared to those who never experienced service failure. According to Smith and Bolton (1998), such phenomenon is called as service recovery paradox. As this study was conducted in casual restaurant setting, restaurateurs should consider service recovery as part of their customer service strategies due to the mushrooming of restaurants in Malaysia.

The effect of interactional justice on recovery satisfaction appears to be stronger than procedural justice and distributive justice. This results indicate the importance of demonstrating empathy and being courteous when interacting with the customers when solving their problems. The empirical results are in line with the studies conducted by Tax, Brown, and Chandrashekaran (1998) and Spreng, Harrell, and Mackoy (1995) as they found that interactional justice was the most important aspect to restore customer satisfaction. Therefore, restaurant employees should display appropriate attitudes during service recovery as poor employees' manner may be disastrous as customers may spread negative word-of mouth and never come back. (Siu, Zhang, & Yau, 2013).

Overall, the present study demonstrates the need to perform service recovery by considering monetary and non-monetary compensations in the context of casual restaurant. This study helps to better understand the three dimensions of service recovery that should be considered by academicians and practitioners. Future researchers are suggested to replicate the same study in other service environment and the empirical results could be compared to see the difference.

Dynamics of Investment of Mandatory Private Pension Funds from Romania during May 2008 - March 2015

Tudor Colomeischi PhD, Stefan cel Mare University, Faculty of Economics and Public Administration, Suceava, Romania, tudorcolomeischi@yahoo.ro, tudorc@seap.usv.ro

Abstract

Since 1990, the public pension system in Romania has started to deal with special problems, in particular demographic problems. To these were added and problems due to reduced funds for pension payments. In this context were introduced in 2007 the private pensions. It can be said that basically that was the moment when the new system of Romanian pension, came into being, structured around three pillars, one state and two private piers. In this article we propose an analysis of how it has evolved Pillar II of mandatory private pensions in Romania in May 2008 - March 2015 in terms of investment. We took into account the dynamics of the most important financial investment instruments found in Pillar II pension funds.

Keywords: mandatory private pensions, investments, Pillar II, bank deposits, corporate bonds

JEL: E26, E31

General considerations regarding the investments of private pension funds

The principles that must comply with pension companies to invest assets of pension funds are as follows: [3]

1. The investment must be made solely in the interests of participants in a way that ensures the security, quality, liquidity and profitability;

2. The investments must be made primarily in instruments traded on a regulated market, investing in instruments that are not traded on a regulated market may not exceed prudential quotas;

3. investments in derivatives are permitted only to the extent that contribute to lower investment risks or facilitate efficient portfolio management;

4. assets in which are invested must be diversified properly so as to avoid excessive reliance on any particular asset, issuer or group of undertakings and accumulations of risk in the pool of assets. Thus, the pension company may invest up to 5% of the assets of a pension fund in one company or in each category of assets thereof and a maximum of 10% of the assets of a pension fund may be invested in assets of a group of issuers (companies) and their affiliated persons.

Pension company may invest in [8]:

1. *money market instruments*, including accounts and deposits in lei at a bank, Romanian legal entity, or a branch of a foreign credit institution authorized to operate in Romania and which is not in the procedure of special supervision or special administration or whose approval is not withdrawn without exceeding a 20% share;

2. *bonds* issued by the Ministry of Public Finance of Romania, the EU Member States or belonging to EEA, a percentage up to 70% of total pension fund assets;

3. *bonds and other securities* issued by local government authorities in Romania and EU Member States or belonging to EEA, a percentage up to 30% of total pension fund assets;

4. *securities traded on regulated and supervised markets* in Romania, belonging to EU Member States or EEA, a percentage up to 50% of its total assets;

5. *bonds and other securities* issued by third countries, the percentage of up to 15% of total pension fund assets;

6. *bonds and other securities traded on regulated and supervised markets,* issued by local government authorities in third countries, the percentage of up to 10% of total pension fund assets;

7. *bonds and other securities of foreign bodies*, if such instruments are listed on recognized stock exchange and meet rating requirements as a percentage of up to 5% of the total pension fund assets;

8. *equity securities* issued by collective investment in transferable securities from Romania and other countries, the rate of up to 5% of the total pension fund assets;

9. other forms of investment laid down by the rules of the Financial Supervisory Authority (FSA).

There may not be invested pension fund assets in particular categories of assets as assets that, by law, cannot be alienated, assets whose valuation is uncertain, as well as antiques, artwork, vehicles, real estate, stocks, bonds and other securities issued by the company or any other assets of the pension rules established by (FSA) [2].

Pension company produces **a statement of investment policy** that is revised whenever a significant change occurs in the investment policy, or at least every three years, with the agreement (FSA) and informing participants.

Investment assets of private pension funds and the results of the investments are tax free. [5]

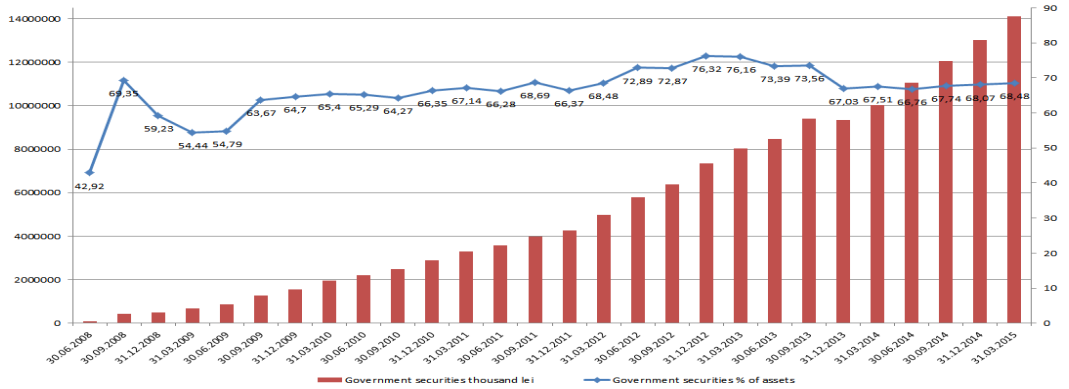
Company pension exercises in the name and the exclusive interest of the participants the right to vote at general meetings of shareholders of the companies in whose capital was invested pension fund assets [8].

Under penalty of nullity, *pension fund assets shall not constitute guarantees* and may not be used for credits. In addition, pension fund assets cannot be alienated from pension company / special administrator, auditor, depository members and (FSA) staff, individuals related to those mentioned above and any other person covered by the rules of (FSA).

The evolution of investments in government securities as main investment tool for Pillar II

In the context of a market still at the beginning of road in terms of restrictive legislation and the imposition of a very careful monitoring by (FSA), managers invested assets of private pension funds *prudently*.

In Figure 1 is described the evolution of the main tool in the investment portfolio included in Pillar II pension funds, ie government securities. It should be noted that most government securities were issued by the Romanian state (in excess of 98%). Apart from the Romanian government securities, private pension funds were invested in government bonds issued by Italy, Poland, Hungary or Croatia [6].



Data source: [4], [7]

Figure no. 1 The evolution of the value of government securities and their share in the total asset of Pillar II

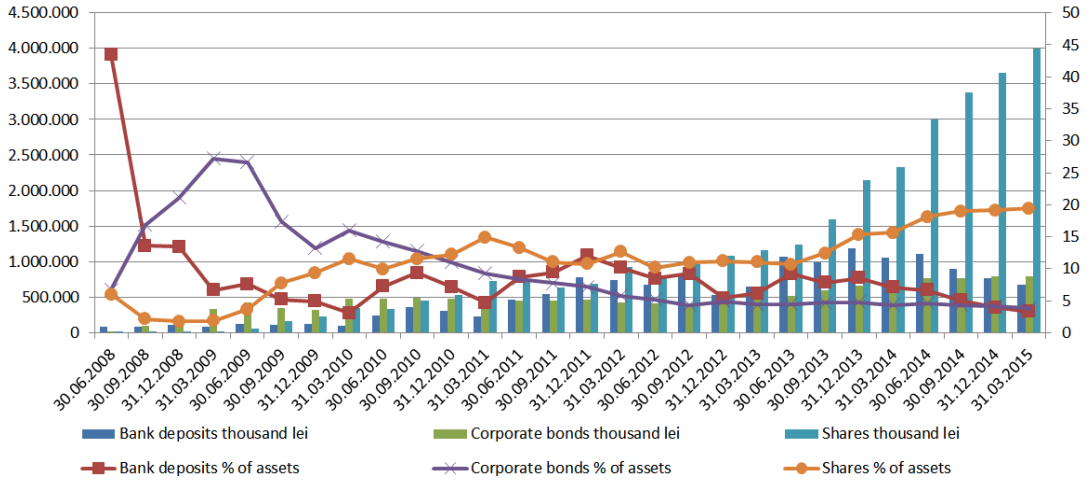
The government securities, with one exception (the first month that were reported investments - June 2008) were the instrument of investment preferred by private pension fund managers. It was also the only instrument whose value has risen almost continuously from 80 348 thousand at June 30, 2008 to 14,103,315 thousand at March 31, 2015 ie an increase of over 175 times. The very accelerated pace of increase in the value of government securities slowed from the beginning of each year, ranging from an increase of 513.6% in 2008 (from 80 348 thousand to 493 017 thousand) to the increase of 27.04% in 2013 (from 7,358,506 thousand to 9,348,514 thousand), followed in 2014 by a larger increase of 39.28%. [1]

As *a share of total assets*, government securities accounted for more than half of the investments in Pillar II, the only month when they fell below 50% being the month of June 2008, when they accounted for 42.92%, this being the only month when they were surpassed in value of another investment instrument - bank deposits. Overall, their share in Pillar II's investment portfolio increased by 25.56% from 42.92% on 30 June 2008 to 68.48% at 31 March 2015. The value of government securities shares followed the same trend of rapid growth in the beginning, their share increased most with 16.31% in 2008 (from 42.92% to 59.23%), while the lowest annual increase they had in 2011, of only 0.02% (from 66.35% to 66.37%). 2013 was the only year that saw a decrease in their share in total assets of -12.17% from 76.32%, which represented the peak of the entire period at 67.03%.

The evolution of investments in corporate bonds, bank deposits and shares in Pillar II

In Figure no. 2 we represented the evolution of the value of the other three tools commonly used by investors in Pillar II, bank deposits, corporate bonds and shares, as well as their share in total assets.

Corporate bonds occupied the second position in the investment options for two years in the third quarter of 2008 to third quarter of 2010, when they were exceeded as a share of shares. Their value increased over the period of more than 63 times from 12 520 thousand at June 30 2008 to 798 006 thousand at March 31, 2015. The year with the highest increase was in 2008 and was of 1303.96% from 12 520 thousand lei to 175 776 thousand lei, while the only year that represented a decrease was in 2011, from 476 774 thousand lei to 457 650 thousand lei (-4.01%). [1]



Data source: [4], [7]

Figure no. 2 The evolution of value of bank deposits, corporate bonds, shares and their share in the investment portfolio of Pillar II

If we look at the entire period of operation of Pillar II under review, the *share* in total corporate bonds fell by -2.86% from 6.69% in June 2008 to 3.83% in March 2015. Its evolution can be divided in two distinct periods: before the end of the first quarter of 2009 their share has grown constantly, at March 31, 2009 reaching a peak of 27.23%, after which the trend has been declining almost permanently, on 31 March 2015 reaching a nadir of 3.83%. The only year of increasing the share of corporate bonds was 2008, when it increased by 14.43% (from 6.69% to 21.12%), the developments being negative in other years. Mostly, the share declined in 2009 by -7.89%, from 21.12% to 13.23%. The main issuer of bonds to which was directed investment (over 20%) was the most commonly Romanian Commercial Bank [6].

A major feature of the mandatory pension market was that at the start of the system, pension fund managers have made large investments in bank deposits. Subsequently, following the increase in amounts collected monthly, they have diversified portfolios of investments in order to achieve the target. The main banks preferred by investors were BRD Groupe Societe Generale, Garanti Bank, Raiffeisen Bank, the Romanian Commercial Bank and Unicredit Tiriac Bank. The majority consisted of bank deposits in national currency (70%), to which were added the euro, US dollar, the Polish zloty [6].

The amount of **bank deposits** had the most irregular evolution of the main instruments of investment, the only trend that has formed is the increasing one of the year 2011. Overall, their value rose almost 9 times from 79 459 thousand lei from start to 679 088 thousand lei in March 2015. The highest annual percentage growth was registered in 2010, of 166.22%, from 116 838 thousand to 311 046 thousand, whereas in 2014 it was recorded the biggest annual fall of - 36.26% from 1,192,516 thousand lei to 760.109 thousand lei. [1]

And *the share* of bank deposits in total assets was still fluctuated in total decreasing by -40.14%, from 43.44% on 30 June 2008 to 3.3% at 31 March 2015. The year with the highest decrease in the share of bank deposits in total assets was 2008, from 43.44% to 13.43% (-30.01%), while the largest increase was recorded in 2011 and was 4.9 %, from 7.18% to 12.08%. During the period under consideration, the share of this investment tool was between 3.08% at 31 March 2010 to 43.44% at 30 June 2008.

Except for the four quarters, the value of investments in **shares** increased constantly over the period. Throughout, it has increased more than 356 times, from 11 219 thousand lei at June 30, 2008, up to 3 995 090 thousand lei in March 2015. Each year the value of shares increased, the maximum increase

being of 1433.09% in 2009 (from 14 542 thousand lei to 222 942 thousand lei) and the lowest increase of 29.62% was in 2008 (from 11 219 thousand lei to 14 542 thousand). [1]

As *a share* of total assets, shares have fared somewhat opposite bank deposits, starting with weights modest but increasing in the second half of the review period. As a global trend, the share of this instrument in total increased by 13.41% from 5.99% on 30 June 2008 to 19.4% at 31 March 2015. On an annual basis, in 2008 and 2011, the share has decreased, the largest decrease being of -4.24% in 2008 from 5.99% to 1.75%. In the other two years were recorded increase, the biggest jump was in 2009, from 1.75% to 9.34% (7.59%). The highest share was reached on 31 March 2015 of 19.4% of total assets and e the smallest share of just 1.75%, was recorded on 31.12.2008.

Over 70% of the equity investments targeted Romanian issuers among the most preferred Property Fund, Petrom, Banca Transilvania and SIF 2 Moldova. Among foreign issuers were found companies in Poland, Hungary, Germany, France and Austria. [6]

The evolution of investments in municipal bonds, bonds of foreign and nongovernmental bodies, Equity UCITS, hedging instruments and commodities and their share in the portfolio of Pillar II

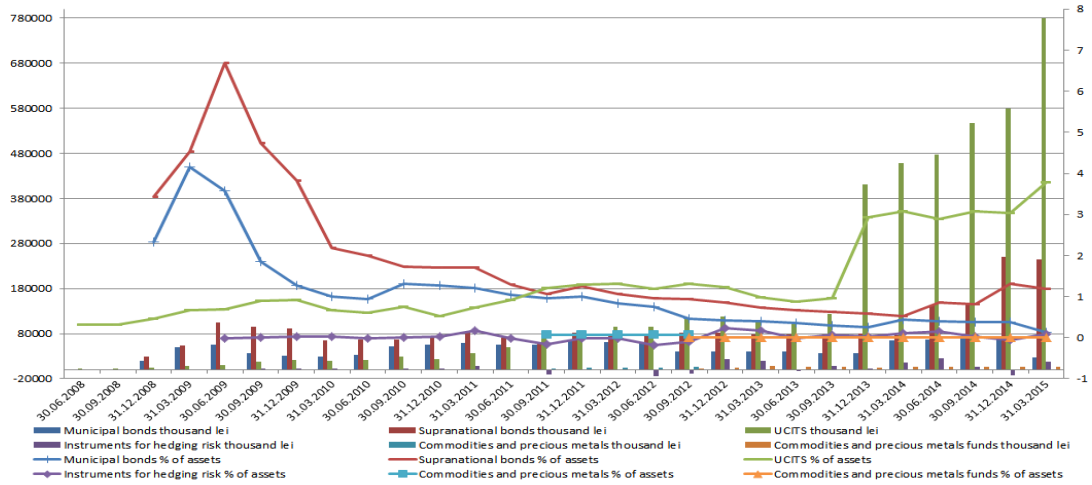
In Figure no. 3 we represented the evolution of the share and value of the less used instruments by investors in Pillar II.

It should be noted that, if we consider *municipal bonds*, first investment values appear until the first of December 31, 2008, because until then they were reported by companies with government securities. The respective aggregate values were assigned to government securities, which however had a much higher total. The evolution of the value of municipal bonds was one irregular, increasing overall by 36.88%, from 19 377 thousand lei at 31 December 2008 to 26 523 thousand lei at March 31, 2015. In four of the six years the value of municipal bonds increased, the strongest growth of 92.83% being in 2014 (from 36 438 thousand lei to 70 265 thousand lei), while the largest decrease was recorded in 2012 of -37.85% (from 64 469 thousand lei to 40 069 thousand lei) . [1]

Except for four quarters, the *share* of municipal bonds in total assets declined continuously, the overall decreasing being of -2.2% (from 2.33% to 0.13% in March 2015). On an annual basis, with the exception of 2014, every year decreases of the share were recorded, the highest decreases being in 2009 with -1.05%, from 2.33% to 1.28%. In 2014 the only growth was recorded of 0.11% (from 0.26% to 0.37%). Municipal bonds had the highest rate, 4.15% of total assets of Pillar II in March 31, 2009, and the lowest, of only 0.13% at March 31, 2015.

Investment in municipal bonds mainly targeted municipalities in Romania (in excess of 75%), but also from Finland, Sweden and Spain [6].

Foreign bodies bonds, after they have been avoided at the beginning, they had an oscillating evolution. On the whole, their amount has increased almost 9 times between December 31, 2008 and March 31, 2015 from 28 668 thousand lei to 245 444 thousand lei. From annual perspective, their value rose in four years (2009, 2011, 2012 and 2014), with higher growth in 2009 of 217.72%, from 28 668 thousand lei to 91 083 thousand lei. In 2010 the value of these investments has declined the most with -19.07%, from 91 083 thousand lei to 73 718 thousand lei. The highest level achieved by these instruments was 249 633 thousand lei at 31 December 2014 and the lowest 28 668 thousand lei at December 31, 2008. [1]



Data source: [3], [6]

Figure no. 3 The evolution of value of municipal bonds, bonds of foreign and nongovernmental bodies, Equity UCITS, hedging instruments and commodities and their share in the portfolio of Pillar II

Except for the beginning, the *share* of investments in bonds of foreign bodies fell almost continuously, with a total decrease of -2.25%, from 3.44% in December 2008 to 1.19% in March 2015. The only years growth was recorded were 2009 and 2014 with higher growth in 2014 of 0.73%, from 0.58% to 1.31%. In other years the shares fell, the most with -2.12% in 2010 from 3.82% to 1.7%. The share of this instrument investment was 0.52% at 31 March 2014 and 6.69% at 30 June 2009. The portfolio of foreign bodies bonds composed primarily of securities issued by the European Investment Bank, European Bank for Reconstruction and Development and the World Bank [6].

Although regulations establish a share of up to 5% of the total assets of a pension fund, investments in *securities issued by collective investment in transferable securities (UCITS unit)* had low weights and values at the beginning, only after 2012 managing to cross the threshold of 1%. On the whole they increased between 30 June 2008 and March 31, 2015 over 1,287 times, from 605 thousand lei to 778 815 thousand lei. Every year the level has increased, the maximum increase of 539.01% in 2008 (from 605 thousand lei to 3866 thousand lei, while the minimum of 4.57%, from 21 669 thousand lei to 22 660 thousand lei. [1]

Between 30 June 2008 - March 31, 2015, the share of the UCITS increased by 3.46%, from 0.32% to 3.78%. The largest annual increase in weight was 1.72% in 2013 (from 1.22% to 2.94%), while the largest decrease was recorded in 2011 of -0.39% (from 0.91% to 0.52%). The largest share of this instrument reached was 3.78% at March 31, 2015 and the lowest of 0.32% was recorded on 30 September 2008.

Hedging instruments and commodities, and precious metals recorded from their occurrence extremely small shares and values in total asset. Only the first category of investment overcame a one-time share of 0.2% on 31 December 2012.

If we consider the investment allocation of Pillar II country, on December 31, 2014 the situation was as follows: 93.24% investment in Romania; 1.31% bonds issued by the European Investment Bank, European Bank for Reconstruction and Development and the World Bank; 5.45% investment in EU countries, out of which 2.49% shares, 1.47% of EU corporate bonds, 0.8% EU Equity UCITS, 0.46% EU bonds and 0.23% municipal EU bonds [5].

Conclusions

On December 31, 2014 the privately managed pension system (Pillars II and III) reached 20.2 billion RON (4.5 billion Euros), representing 3.03% of GDP compared to 2.31% in December 2013. In the private pension funds (Pillar II), representing at 31 December last year 95% of the total system, it was maintained an annual growth rate higher, characteristic to seven years of operation of 37.15% .

93.2% of assets were placed in Romania, 5.5% invested in instruments of European Union and 1.3% were bonds issued by EBRD and EIB. Private pension funds continue to be a financier of the Romanian state by investing primarily in securities issued by the Finance Ministry.

Given the evolution of internal and external financial environment, the strategic asset allocation of private pension funds has changed quite high lately. The share of bank deposits was halved, while the share of fixed income instruments, shares and investment funds have increased. The largest increase in 2014 was that of shares.

Administrators have continued the general trend of reducing investments denominated in lei. At the end of 2014, 13.53% of assets reflected foreign currencies, of which 11.24% were denominated in euro. The weights investments in US dollar and Polish zloty fell, while administrators have opted Turkish lira portfolios, volatile currency, but which may bring short-term gains.

Currency risk was partially covered for the euro, the Hungarian forint, Polish zloty and US dollar using forward contracts concluded with banks. Coverage by hedging was reduced compared to previous years, especially for the US dollar. Private pension funds investments in government securities were percentage of 99.34% in instruments issued by the Romanian RON, EUR and USD. The rest consisted of securities issued by Italy, Poland and Slovenia, their cumulative share of less than 1% of total investments in government securities.

Corporate bonds represent 4.19% of the assets of the private pension system, down slightly from 2013. Romanian corporate bonds have increased as share from 59.48% to 64.62% of the total corporate bonds. Supranational bonds accounted for 1.33% of the total assets of private pension funds, while municipal bonds had a share of 0.37%. Administrators have continued to increase equity exposure in 2014 compared to 2013 from 15.56% to 19.25%, focusing mainly by Romanian issuers and increased liquidity. Of these, the top 10 issuers listed on the BSE after liquidity (Property Fund, Romgaz, Transilvania Bank, Petrom, Electrica, Transgaz, Transelectrica, BRD, SIF Oltenia and SIF Moldova) accounted for 89.53% of Romanian stock portfolio and 22.2 % of total assets of private pension funds.

Due to their long-term investors, pension funds have accumulated significant holdings in companies that are top liquidity on BSE. Apart from the issuers that are in the top 10, pension funds have accumulated 10.47% of SIF Transilvania, SIF Banat Crisana of 8.77% and 13.07% of BSE.

Investments in shares of foreign issuers were diversified, the largest contributors being that of Erste Bank with 9.51% of total shares and 0.24% of the total foreign assets of private pension funds.

And in 2014, pension funds have constituted deposits at banks in Romania, 90.78% of which is denominated in lei, 7.06% in US dollars and the rest in Polish zloty, Hungarian forint and euro. The trend to reduce interest rates offered, due to expansionary monetary policy led administrators to halve the share of amounts invested in bank deposits, opting for other types of assets, mainly shares. At the end of 2014, deposits represented only 4.01% compared to 8.59% in 2013.

And in 2014, BRD was the preferred bank of administrators for setting up deposits. Second place belonged to BCR and third place the Garanti Bank. Together, the three banks mentioned cumulated 71.28% of total deposits in the system, up to 2013, when the first three banks had 50.7% of the total.

The share of investment funds in total assets rose slightly, Romanian administrators preferring UCITS that invest in bonds and UCITS of shares of European Union and Romania. The investment

portfolio structure and diversification, reflecting the risk diversification plays an important role in ensuring adequacy of income from private pensions.

The international financial crisis that began to manifest mainly in the second half of 2008, influenced to a certain extent the private pensions in Romania, but not in the proportion of other countries with private pension systems more developed (in Romania pension funds were only in the early months of operation). Moreover, the private pension system in Romania emphasizes *the safety of participants* and the most important security features of the system derived from the protection that the law gives the participant. By way of organizing the system by separating pension fund assets from the administrators, participants' contributions are being sheltered from the difficulties that can pass at a time, administrators of private pension funds or their shareholders.

Negative Interest in IFRS

Mário Papík, Faculty of Management Comenius University, Bratislava, Slovakia,
mario.papik@gmail.com

Abstract

Since September 2012, IRFS Interpretation Committee has held several meetings, where the issues of negative interest rates and their impact on IFRS accounting system were discussed. The results of these meetings are following: negative interest rate on financial assets is expense, but other than interest expense and negative interest rate on financial liabilities is revenue, but also other than interest yield. Companies such as KPMG or Deloitte expressed their disagreement with this solution in 2013 and 2015. Current analysis of negative interest and its influence on accounting is the topic of this article.

Keywords: negative interest, interest yield, interest expense, IFRS

Introduction

The main objective of the European Central Bank in a research study by Nováčková and Sysákova (2015), besides supporting of the banking sector, is to maintain the price stability by keeping the annual inflation rate close to 2 %. Šlahor et al (2015) mentioned when the inflation is higher than 2 %, the European Central Bank will raise the interest rates. Consequently, loans become more expensive and to generate savings becomes more interesting for clients. When the inflation is much lower than 2 %, central bank will decrease the interest rates. Then the loans are cheaper and population begin to more spend, which helps following development of European region and economy growth. Pawera et al (2015)

Inflation in Eurozone is much lower than 2% in the long term. Thus, the Governing Council adopted the decision to reduce interest rates determined by the ECB e.g. marginal lending facility, main refinancing operations and the deposit facility, in summer of 2014. Money market will function correctly, if sufficient margin is between mentioned rates. Because the deposit facility rate had been close to 0 % before the decision of the Governing Council and main refinancing operations had been around 0.25 %, after the decrease of marginal lending facility to 0.15 %, the deposit facility decreased to minus 0.1 %. European Central Bank (2014)

Since the mid of 2014, commercial banks on the European interbank market have hold their excess deposits at the central bank for negative interest rates more frequently. Meanwhile, negative interest rates have extended to other interbank market operations such as EONIA (Euro Overnight Index Average) or EURIBOR (Euro Interbank Offered Rate), which are used for the valuation of financial products such as bond with variable coupon or derivatives.

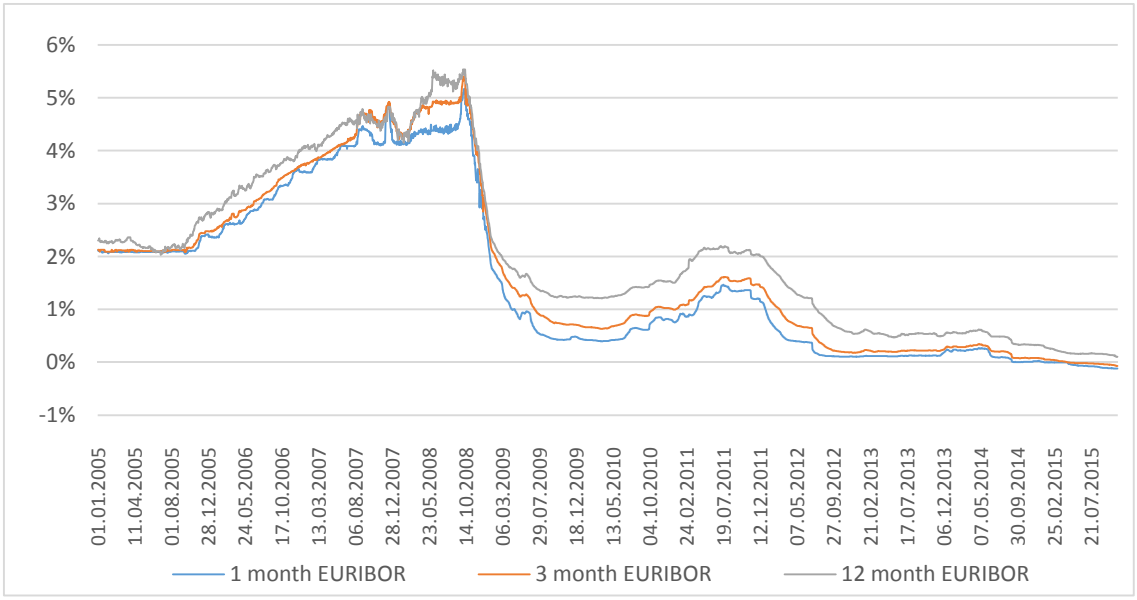

Fig 1: 1 month, 3 month and 12 month interest rates of EURIBOR

Historically, the negative interest rates were a rare phenomenon. Nowadays, economic crisis and investors' desire to safely store their assets rather than their consumption have signed under their existence. In Europe, this phenomenon is typical for interbank market, where the main reason for negative interest rate is the aim to decrease holding excess deposits at the central bank by commercial banks. European central bank is trying to reduce excess liquidity from commercial banks thanks to negative interest rates. Paškrtová and Stoličná (2014) They are also trying to encourage commercial banks to further distribute excess liquidity in form of loans to non-financial entities.

In Denmark, negative interest rates have not occurred only in the interbank market, but also in the commercial banking sector. Some commercial banks started to charge negative interest deposits and mortgages of selected clients. Except Denmark, the negative interest rates have been introduced also in other European countries such as Sweden or Switzerland. National Bank of Slovakia (2013)

The Aim of the Article

The aim of the research is to interpret the concept of negative interest. Because of the interpretation of this term is ambiguous and there are multiple views on it, the task of this article is to highlight the differences in the interpretations arising from the international accounting standard IFRS. The outcomes of this research are formulating recommendations useful for further research of this topic and analysis of influence of negative interest rates on the accounting in accordance with the international accounting standard IFRS.

Methodology

The issue of negative interest rates hasn’t been fully known yet. This is the reason, why it was necessary to define basic terms from the perspective of authors and from that of international accounting standard IFRS as well. Examining the issue was carried out by the means of analysis of international accounting standards and IFRS Interpretations Committee Meeting staff papers.

Current Interpretation of Negative Interest

Negative interest rate is not an issue, which is typical only for financial sector. In a period of very low inflation and consumption, this issue has the potential to affect the deposits and loans of ordinary

population. The phenomenon of negative interest rates affects different departments of companies, such as the risk management, payable and accounting.

For a proper understanding of their impact on record interest in accounting, it is necessary to correctly interpret the term of negative interest rates and logically classify it.

"The assets of an entity are a result of past events which increase economic benefits of an entity in the future and can be reliably recognized in the financial statements on the balance sheet." Olvecká (2014) Conversely, the liabilities of an entity are a result of past events which decrease economic benefits of an entity in the future. Mariak (2014) "The Act on Accounting 431/2002 in Slovakia defines revenues as increases in economic benefits during an entity's financial year, which can be measured reliably." Kajanová (2014)

According to IAS 18, revenues include those activities that result in the gross inflow of economic benefits (cash, receivables, other assets) arising from the ordinary operating activities of an entity (such as sales of goods, sales of services, interest, royalties, and dividends).

Positive interest rate arising from assets (e.g. from the provided deposit) is therefore considered as income, because these operations increase the economic benefit of the entity. The lender receives income from its capital which is lent to the debtor. If it is an interest arising from liabilities (e.g. received loan) that reduce the economic benefits of an entity, we will consider the interest as an expense. International Accounting Standards (2009)

Since the interest, a lender bank pays for its assets corresponds to the interest a borrower bank receives for its liabilities, it is not necessary to analyze the emerging interest (positive or negative) in the assets and liabilities separately.

There is not quite obvious economic explanation for the negative interest phenomenon and the description of entire transmission mechanism in the economy is not very clear. The basic interpretation of negative interest sees it as custodian fee for safeguarding the holder's money, which lender pays the debtor. International Accounting Standards (2014) Next explanation of the negative interest concept may be seen from the perspective of the taxation of savings. Ifhannoun (2015) The income of a saver, who is unable to spend it over a certain time period, will be cut by tax corresponding to a negative interest rate.

Different interpretations of the phenomenon raise questions concerning the possibility of presenting a negative rate in the income statement. Their existence is not defined by any adjustment under IFRS. Due to this situation, in September 2012 and January 2013 there were IFRS Interpretations Committee Meetings. One of the peripheral issues discussed there was also negative interest arising from financial assets.

Conclusions of IFRS Interpretations Committee were:

a) Interest on a financial asset does not fit the definition of interest yield in IAS 18 Revenue because it reflects a gross outflow, instead of a gross inflow of economic benefits.

b) Interest on a financial assets cannot be regarded as interest expenses because interest expenses can arise only from the financial liabilities of the entity. But it can be fit some other appropriate expense classification. For example fee for custody. IFRS Interpretations Committee Meeting (2013)

Since the IFRS Interpretations Committee considered further defining of negative interest unnecessary in 2013, it was not involved in agenda for next meetings.

Gaps in Current Interpretation of Negative Interest

To interpret negative interest as other expenses or as expenses for safekeeping, is economically understandable for customers' deposits in commercial banks or commercial banks' excess liquidity deposit to the central bank.

Clarity of interpretation of negative interest begins to fade at the moment of their application to other financial products than deposits. In case of high-quality government bond with a floating three-month coupon bound to interest rates EURIBOR with a negative risk premium, the following situation may arise:

a) In case of buying such bond at the beginning of 2014 with an interest rate fixation from January of 2014 to January of 2015, and without a risk premium, these coupons would acquire a positive value. Accrued interest from this coupon would be classified as revenue (period 0 to 1.25 at figure 2.).

b) In the fixed interest rate environment of three-month EURIBOR in April of 2015, this coupon would acquire a negative value. Accrued interest from this coupon would consequently be accounted as other expense, eventually as custody fee (period 1.5, figure 2).

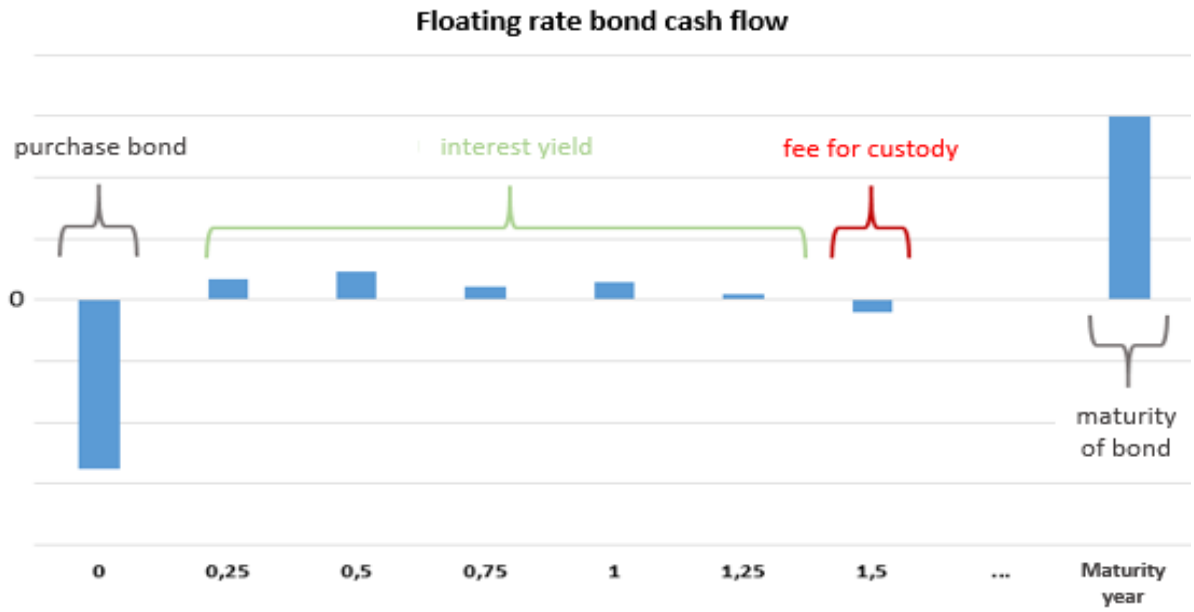

Fig 2 Floating rate bond cash flow

Cash flows from the assets held this way would consist of two main parts, namely interest yield and custodian fees (expenses). Each of these financial flows would arise in different periods.

Purchased bond would accumulate an interest yield in the first quarter. But in the second quarter, the coupon of the same bond would be considered as custody fee. Considering negative interest as fee for custody or eventually as other expenses is confusing, since in both cases, the coupon has the same origin.

The second gap occurs in evidence of these expenses as custodian fees, because in case of debt securities, this operation is unclear, as opposed to provided deposits.

Officials of KPMG and Deloitte pointed out similar shortcomings in interpretation of negative interest IFRS Interpretations Committee. They see a major gap in recording negative interest as decided by the Committee in 2013. This recording is distorting and insufficiently intuitive. The basic arguments were expressed by KPMG as follows:

a) The interest yield of a financial asset can contain several components, some of which can be negative,
b) Interest cash flows with a negative yield component or even a total negative yield, are, intuitively and economically, still considered a part of (net) interest income,
c) Interest cash flows from a financial asset can be negative as a temporary and exceptional phenomenon – but are still interest yield,
d) Adding positive to negative yield components of the same origin (same instrument) is not a matter of offsetting but of aggregation. IFRS Interpretations Committee Meeting (2013)

Based also on these objections, the IFRS Interpretations Committee decided to re-include the issue of negative interest to its agenda in January 2015. The IFRS Interpretations Committee insists on the classification, which classifies negative interest of financial assets among other expenses or fees for safekeeping, because the current definition of revenues by IAS cannot include it to the interest yield (does not increase the economic benefits of financial assets) as well as to the interest expense (which may be formed only on financial liabilities). IFRS Interpretations Committee Meeting (2015)

Although the committee did not place solving the uncertainties of negative interest among its priorities, the final report of the meeting held in January 2015 includes the possibility of further analysis of the issue.

Thanks to the reformulation of the definition of revenues in IAS18, it would be possible to look at negative interest on financial assets as a negative yield. This solution would bring clarity as possible records negative interest in the IFRS accounts because now, the entities could reported negative interest only as other expenses or as fee for custody. In case of assets the interest rate of which is bound to the interest rate of the interbank market, the financial flows of these assets should always have two components: interest yield and expense for the custody, which would need to be recorded separately. If negative interest is classified as revenue, it would enable to record positive as well as negative interest produced by financial assets clearer.

Conclusion

The Financial Times estimated the value of assets with negative interest rate by 8 January 2015 in Europe, at about EUR 1.2 billion and according to JPMorgan it is EUR 1.5 billion. Clinch (2015)

If the inflation rate in Europe does not increase in the near future, it is very likely that such interest will be more common, and that negative interest rates will occur in the interbank market and commercial banking very frequently. That is the reason why it is needed to further analyze the issue of negative interest rate and to clearly define its meaning and interpretation. This interpretation should not be purposeless, but should be helping in other related fields such as risk management, reporting or accounting.

An unclear interpretation of the negative interest on one hand and a strict definition of other terms on the other hand make it complicated to properly record negative interest in accounting. Current approach to the phenomenon of negative interest that understands it as an expense different from interest expense has still gaps which are needed to be fixed. The IFRS Interpretations Committee should take into consideration claims of big audit and accounting firms and consider a redefinition of terms in international accounting standards, so they would be adaptable to the situation in economy.

When the ECB has reduced the interest rate of deposit facilities to 0 % in 2014, it was a signal to financial institutions that they should implement negative interest into their accounting systems. Since later interpretation of terms from this field can make the expenses for such implementation expensive, it is needed to address this issue.

Abstract

While studies on innovation capabilities have been quite extensively reported in the literature, very few have attempted to examine the relationship between knowledge characteristics and innovation capabilities at the individual level perspective. Inspired by this research gap, this study examined knowledge characteristics, which are part of work design, on innovative work behavior (IWB). The research model along with hypotheses are developed from the literature and tested based on the data collected through a survey of officers working with the Malaysian federal government. The results suggest that three out of five knowledge characteristics, namely, job complexity, information processing and problem solving are significant predictors of innovative work behavior. The study did not find any support on the relationship between skill variety, specialization and innovative work behavior. This study has contributed to the body of knowledge from both theoretical and practical perspectives and should capture the interest of the researchers and practitioners.

Keywords : Work design, knowledge characteristics, innovation capability, knowledge management

Introduction

Innovation has been considered as the key factors for the survival, growth, and development of an organization. According to Mulgan & Albury (2003), in the private sector, the main motivation for innovation is "the need to maintain or increase profitability, which in turn provides an incentive to innovate to cut costs, improve market share and to create new products and services". In contrast, innovation in the public sector is equally because: (i) innovation will develop better ways of meeting needs, solving problems, and using resources and technologies, (ii) without innovation the inevitable pressures to contain costs can only be met by forcing already stretched staff to work even harder. Hence, innovation in the public sector will help increase the responsiveness of government services and keeping up with public needs and expectations (Mulgan & Albury, 2003).

Casebourne (2014) explained that innovation in the public sector is challenging because public services deal with complex problems and have contradictory and multifarious demands; and they need to respond quickly, whilst balancing the need for security and continuity, and must be transparent and accountable. Nonetheless, Borin (2001) found that 50% of the innovation in the public sector was initiated by front line staffs and managers**.** Innovation that is carried within the capacity of an individual employee is termed as innovative work behavior (IWB). The extant literature on IWB has paid much interest in the private sector. Even in the context of Malaysia, studies such as Kheng et al., (2013); Leong & Rasli (2013) and June & Kheng (2014) were mainly conducted involving employees of private companies.

Given this background, the situation of IWB among civil servants of the Malaysian government is still unknown. Driven by this gap, a study was undertaken with the aim of examining the relationship between knowledge characteristics as one of the components of job design, and IWB among officers of Malaysian federal government.

Literature Review

O'Sullivan & Doley (2009) defines innovation as the application of practical tools and techniques that make changes, large and small, to products, processes, and services that results in the introduction of something new for the organization that adds value to customers and contributes to the knowledge store of the organization. The Department of Innovation, Industry and Research of the Australian Government (2011) defined innovation as "the implementation of a significant change in the way an entity operates or in the products it provides. Innovations comprise new or significant changes to products, operational processes, organizational methods, or the way the entity communicates with users." Innovation can take place at various levels: individual, teams, departments or organization. An employee, within his individual capacity, can also involve in innovation activities aimed to improving his work performance. The innovative behavior, which is normally voluntary, can appear in the form of new methods or approach to execute tasks. In the context of public sector, Bartos (2002) defined innovation as a change in policy or management practice that leads to a lasting improvement in the level of service or quantity or quality of output by an organization.

De Spiegelaere et al., (2012) defined IWB as "all employees' behavior directed at the generation, introduction and/or application (within a role, group, or organization) of ideas, processes, products or procedures, new to the relevant unit of adoption that supposedly significant benefit the relevant unit of adoption". Individual characteristics, organizational characteristics and external characteristics have been found to have a bearing on the IWB. External characteristics, in the form of competitive pressures and socio-political pressures will create and increase the incentives towards organizational managers to make sure that their organizations are conducive for innovation to take place (Nijenhuis, 2015). Denti (2013) identified from a review, the individual characteristics that have an effect on IWB are personality; cognitive ability and style; intrinsic motivation; self efficacy; and task characteristics. Within the task characteristics, job complexity, information processing, problem solving, skill variety is among the factors that have shown to have a significant effect of IWB.

Theoretical Framework

Figure 1 presents the theoretical framework used in the study. The dependent variable is an IWB while the independent variable is the knowledge characteristics. Mulgan & Albury (2003) found that the majority of innovations in the UK public sector is incremental in nature, involving relatively minor changes to existing processes and services. Given the difficulty in measuring innovations in the public sector, Halvorsen et al (2005) suggests that when studying innovation in the public sector, 'one has by the outset removed oneself from the narrowest interpretations of innovation'. Hence, following Mulgan & Albury (2003), this study operationalized IWB as consisting of process innovation and service innovation.

According to Morgeson & Humphrey (2006), knowledge characteristics of work design "reflect the kinds of knowledge, skill, and ability demands that are placed on an individual as a function of what is done on the job". Accordingly, the authors categorized knowledge characteristics as comprising of job complexity, information processing, problem solving, skill variety and specialization.

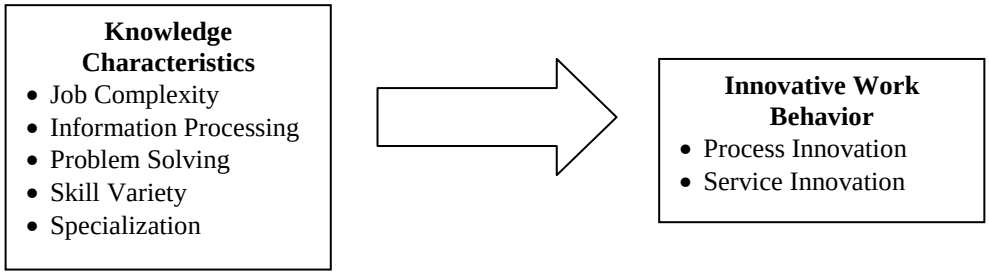

Fig 1. Theoretical Framework

Innovative Work Behavior

Nijenhuis (2015) defined IWB as all individual actions directed at the generation, processing and application/implementation of new ideas regarding ways of doing things, including new product ideas, technologies, procedures or work processes with the goal of increasing the effectiveness and success of the organization. Following Dorenbosch et al., (2005), IWB is conceived as a complex behavior comprising of four interrelated sets of behavioral activities, which are (i) problem recognition, (ii) idea generation, (iii) idea promotion and (iv) idea realization. The first two activities is also known as creativity oriented behavior while the last two activities are called implementation work oriented behavior. In the context of public sector organizations, the focus of innovation is on the process and service delivery.

A process innovation is the implementation of a new or significantly improved production or delivery method which includes significant changes in techniques, equipment and/or software (Tiwari, 2008). Process innovations "can be intended to decrease unit costs of production or delivery, to increase quality, or to produce or deliver new or significantly improved products" (Tiwari, 2008). Innovation in services involves transformation in a variety of aspects ranging from how the service is designed and developed to how it is delivered and managed (Miles, 2005). Service innovation can also be categorized based on the type of service that is innovated, namely, physical services, human services, and information services (Miles, 1993). Innovation in physical services involves physical transformation often through the adoption of new technologies, for example, radio-frequency identification (RFID) and refrigeration equipment. Innovation in human services takes the form of improvements in administrative data processing in public sector services and customized IT systems in medical services. Information services are mainly characterized by innovations in IT such as online banking in financial services and interactive digital media in entertainment (Miles, 2005).

Job Complexity

Job complexity refers to the extent to which the tasks on a job are complex and difficult to perform (Morgeson & Humphrey, 2006). A work that involves complex tasks and requires the use of numerous high-level skills will generally foster creativity because it develops self-efficacy of the employee. Oldham & Cumming (1996) asserted that, a complex task will reinforce employee's interest in the job, and the employee will be more motivated to be creative to achieve high performance. Russo (1986) discovered that job complexity may expose workers to new challenges and thus foster learning and skills development. Olhy & Fritz (2009) found that chronic time pressure and chronic job control, as well as daily time pressure are significantly correlated with daily creativity and proactive behavior, which are two important ingredients of an individual innovation capability. A meta-analysis by Hammond et al. (2011) shows that job complexity relates strongly to innovation capability. On the basis of the preceding discussion, the following hypothesis is put forward: H1: Job complexity is a significant predictor of innovation capability.

Information Processing

Information processing is the extent to which "a job necessitates an incumbent to focus on and manage information" (Humphrey et al., 2007). It also relates to the degree to which a job poses cognitive demands on employees in terms of monitoring and processing data or other information. In the knowledge management research "the personnel who specialize in strategic information processing" is called knowledge worker (Drucker, 1999). A study by Grant & Berry (2011) found that information processing skills are an important predictor of employee creativity. Tan et al., (2014) identified three important information capabilities that will drive digital social innovation as information literacy, information immediacy and information liberty. According to Smith (2000), innovation can be better understood as a process in which organization creates and defines problems and actively develops new knowledge to solve them. This will involve a lot of information procession activities where information is collected, analyzed and converted into pertinent knowledge. Vieites & Calvo (2011) showed that information management, which also include information processing, is a significant predictor of a firm's innovation capability. To this effect, the following hypothesis is established: H2: Information processing has a significant relationship with IWB.

Problem Solving

Problem solving is the extent to which a job requires the production of unique solutions or ideas (Humphrey et al., 2007). According to Humprey et al., (2007), problem solving is conceptually identical to creativity as it involves innovating, solving non-routine problems, and preventing errors. A review study by Griffin & Guez (2014) discovered that problem solving is determined by the same underpinning mechanisms, and is influenced by the same factors, as those predicted to underpin, and to influence, innovation. Jabri (1991) categorized two types of problem solving styles, namely, associative and bisociative thinking. Associative thinking represents a systematic problem-solving style, based on the following of habit or a set of routines, adherence to rules and the adoption of disciplinary boundaries while using rationality and logic. On the other hand, bisociative thinking represents intuitive problem-solving style, is characterized by "a tendency to combine separate domains of thought at the same time, a low attention to existing rules and disciplinary boundaries and a tendency towards imagination and intuition". It is believed that between systematic and intuitive problem solving style, the former will tend to inhibit innovative behavior (Scott & Bruce, 1994). Livotov (2013) and Triyono et al., (2015) found that innovative skills can be trained and developed through problem solving skills. Against this backdrop, the following hypothesis is developed: H3: Problem solving has a significant relationship with IWB.

Skill Variety

Skill variety relates to "the extent to which a job requires an individual to use a variety of different skills to complete the work" (Hackman & Oldham, 1980). The authors further stressed that high level of skill variety is expected to support and encourage higher levels of motivation and creativity than are relatively simple and routine jobs. The theory behind providing skill variety in job design is that it will reduce boredom, thereby increasing job satisfaction and motivation. According to Lunenburg (2011), jobs that are high in skill variety are seen by employees as "more challenging because of the range of skills involved; relieve monotony that results from repetitive activity; and gives employees a greater sense of competence". Kassem & Sarhan (2013) discovered that skill variety is significantly related to job performance. Hessels et al., (2014) showed entrepreneurs with skill variety are better positioned to introduce innovations that have technical and commercial values. In another study involving managers, Deegahawature (2014) found that skill variety is a significant predictor of manager's inclination towards open innovation. Drawing upon these justifications, the following hypothesis is established: H4: Skill variety has a significant relationship with IWB.

Specialization

While skill and skill variety relates to the breadth of behaviors and skills involved in a job, specialization represents the depth of knowledge and skills necessary (Humprey et al., 2007). It is also defined as the "extent to which a job involves performing specialized tasks or possessing specialized knowledge and skill" (Morgeson & Humphrey, 2006). Job specialization increases output because workers do not lose time shifting among different tasks and workers with specialties are more likely to be creative and innovative in making their tasks more efficient. According to Adeyoyin et al., (2015), when an organization uses job specialization, every worker is an expert to some degree and employees are able to refine the task for which they are responsible, resulting in increased efficiency and increased production. Their study in the context of a library found that specialization is associated with job satisfaction. In an earlier study, Stats & Gino (2010), found that specialization is correlated with job productivity among employees in Japanese banks. Given the aforementioned arguments, the researcher hypothesized the following: H5: Specialization has a significant relationship with IWB.

Research Methodology

This study used a quantitative approach with a survey research method. The instrument used for collecting the data was a questionnaire, adapted from Morgeson & Humphrey (2006) and Easa (2012). Perceptual measures in the forms of items or statements with corresponding Likert scale were used to measure each construct or variable. For each statement, the respondents were requested to indicate on a seven point scale, the extent they agree or disagree with the statement. The process of developing the questionnaire involved pre-testing and pilot testing. The pre-testing were executed with several experts from the academia and senior officers working with the federal government. The aim of the pre-testing exercise was to assess the content validity and face validity of the questionnaires. Feedbacks obtained during a face-to-face meeting in the pre-testing exercise was used to revise and refine the questionnaire. Accordingly, the questionnaire was pilot tested with 36 officers working with deferral government. Based on their responses the Cronbach's alpha of each construct in the framework was examined. The results as shown in Table 1 suggest that the instrument was highly reliable because the Cronbach's alpha are well above 0.7.

The population of the study was the Administrative and Diplomatic Officers or better known as "Pegawai Tadbir dan Diplomatik" (PTD), working with the ministries of the federal government located in Putrajaya Malaysia. They were chosen because the nature of their jobs which mainly focused on structuring, implementing and managing the country's public policies, including strengthening the administrative functions, social infrastructures and also the performance of economic growths (Pegawai Tadbir dan Diplomatik, 1999). As the main policy makers of the Malaysian government, the PTDs are expected to continually re-invent and innovate the government processes and services, so as to meet with the current challenges faced by the country.

Using the stratified random sampling, a total of 548 questionnaires was distributed to targeted respondents. Several representatives were appointed to distribute and collect the questionnaires in each ministry. A total of 421 questionnaires was returned, giving a response rate of 76.8 %. However, out of this number, 116 questionnaires had to be removed as more than 20% of the questions were not answered, leaving a total usable rate of 72.45% (305). The total number is considered reasonable and in accordance with Sekaran (2003), who suggested that the response rate need to be at least 15% of the total population. The usable questionnaires were then analyzed statistically using IBM SPSS Version 20 and SmartPLS Version 3.0. The IBM SPSS was used for descriptive analysis while SmartPLS was used for measurement model or confirmatory factor analysis (CFA) and hypothesis testing. SmartPLS is a professional statistical software package that enables users to do Structural Equation Modeling (SEM) or PLS path modeling.

Findings

Common Method Bias

Given that this study used common rater (i.e. the same respondent answering all questions in the questionnaire), the need to examine the possibility of the problem of common method bias is therefore crucial. Podsakoff et al., (2003) suggested the use of Harman's single factor test, which requires that the total variance explained for all items when constrained to single construct should not exceed 50%. The results of the Harman's single factor test indicate that the total variance is about 33.3%, which met the recommended value. Thus, it can be concluded that the questionnaire used in the study is free from the problem of common method bias.

Demographic Profiles of Respondents

Out of 305 respondents, 51.1% were female and the remaining 48.9% were male. The breakdown of the respondents' age is as follows: 30 to 34 years (35.7%), 35 to 39 years (18.4%), 40 to 44 years (6.6%), 45 to 49 years (3.3%), 50 years and above (3.3%) and less than 25 years (1.0%).

Hypothesis Testing

Prior to testing the research hypothesis, the path model needs to be assessed in terms of its convergent validity and discriminant validity. According to Anderson & Gerbing (1988), convergent validity is the degree to which different methods used to measure the same construct produce similar results. Convergent validity is used to check the loading of each observed indicator on their underlying latent construct. The convergent validity is normally assessed through composite or construct reliability (CR) and average variance extracted (AVE). Construct reliability measures the internal consistency of a set of measures rather than the reliability of a single variable. The average variance extracted (AVE) measures the total amount of variance in the indicators accounted for by the latent variable. The value of composite reliability (CR) above 0.70 or higher suggests good reliability and values between 0.60 and 0.70 is considered acceptable (Hair et al., 2010). The average variance extracted (AVE) of less than 0.50 or higher is a good rule of thumb, suggesting adequate co-variance (Hair et al., 2006). In this study, both CR and AVE were assessed to address the convergent validity of measures.

Another aspect of validity that needs assessment is discriminant validity, defined as the extent to which a construct is truly distinct from other constructs (Hair et al., 2010). According to Hair et al., (2010) the best approach to assessing the discriminant validity is to compare the square root of each construct AVE to its correlation with other variables. This approach requires that the value of the square root of each construct AVE should be higher than the correlation values among constructs. If this requirement is met, discriminant validity can be assumed. This study also used this approach for assessing the discriminant validity. Figure 2 and Table 1 presents the results of the assessment of the measurement model. The factor loadings for all items surpassed the recommended value or 0.7; the AVE for all construct surpassed the recommended value of 0.5; and the CR for all constructs exceeds the recommended value of 0.7. Table 2 shows that the square root of each construct AVE is higher than the correlation with other variables.Given these results, a convergent validity and discriminant validity of the instrument can be assumed.

Table 1: Assessment of Convergent Validity

Construct	Items	Factor Loading	Average Variance Extracted (AVE)	Composite Reliability (CR)	Cronbach's Alpha
Information Processing	MC_IP1	0.999	0.999	0.999	0.999
	MC_IP2	0.999			
	MC_IP3	0.999

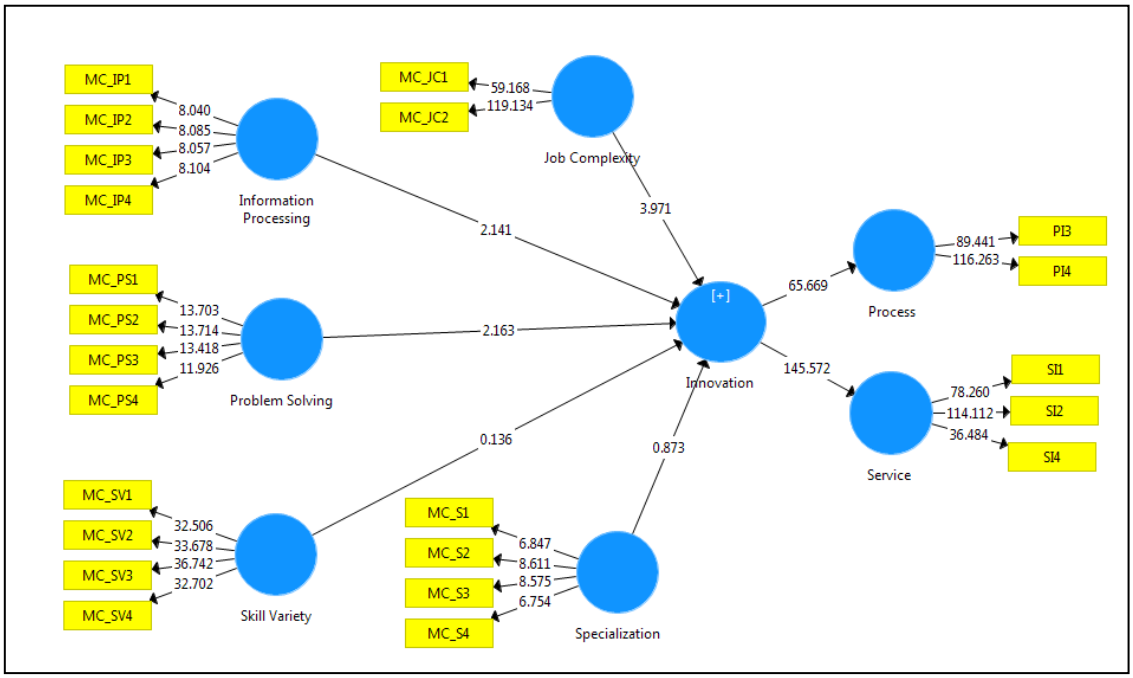

Fig 2. SmartPLS outputs of Bootstraping

Table 3 presents the results of the path analysis or the structural model. Hair et al., (2014) suggested that assessing the structural model involves evaluating the R^2, beta (β) and corresponding t-values. To obtain the t-value, a bootstrapping procedure with 5,000 resamples were executed. The result of the bootstrapping procedure is shown in Table 3. According to hair et al., (2014), the t-statistic value should be greater than 1.96 for the path to be significant. Out of the five analyzed paths, three paths are significant while the other two are not significant ($p > 0.05$). The significant paths are: between

information processing and IWB; between job complexity and IWB; between problem solving and IWB. The insignificant paths are: between skill variety and IWB; between specialization and IWB. With these results, H1, H2 and H3 are supported while H4 and H5 are not supported. The explanatory power of the estimated model can be assessed by observing the R^2 of the endogenous construct i.e. the IWB. For a substantial model, Cohen (1988) suggests that R^2 should be about 0.35 or greater, while Falk & Miller (1992) recommended 0.10 or above. In this study, the R^2 is 0.104, indicating that the estimated model is substantial.

Table 3: Path Coefficients

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P Values
Information Processing →IWB	-3.015	-2.644	1.378	2.187	0.029
Job Complexity → IWB	0.242	0.237	0.062	3.895	0.00
Problem Solving → IWB	3.213	2.861	1.351	2.379	0.018
Skill Variety → IWB	-0.155	-0.172	1.028	0.151	0.880
Specialization → IWB	0.051	0.069	0.066	0.771	0.441

Effect size refers to whether the latent independent variable has a considerable effect on the dependent variable. Using the formula $f^2 = R^2/(1-R^2)$ by Cohen (1988), the effect size is computed and the results showed that the effect is either none or small (Table 4). To interpret the impact of f^2 at the structural level, it has been suggested that the effect is large when f^2 is 0.35 or above, medium when f^2 is between 0.15 and 0.349, and small when f^2 is 0.03 or less (Cohen 1988).

Table 4. Assessment of effect size

Model	Variables Included	Variables Excluded	R Square	Effect size (f^2)	Interpretation
1	Job complexity, problem solving, skill variety, specialization	Information processing	0.075	0.0324	Small
2	Information processing, problem solving, skill variety, specialization	Job complexity	0.069	0.0391	Small
3	Information processing, job complexity, skill variety, specialization	Problem solving	0.085	0.0212	Small

Discussion

The objective of the study was to examine the relationship between knowledge characteristics and IWB among officers of Malaysian federal government. Drawing upon the job design framework, knowledge characteristics were classified into five dimensions: job complexity, information processing, problem solving, skill variety and specialization. From the results of the analysis, it was shown that job complexity, information processing and problem solving does have a significant relationship with an IWB. The combination of these three constructs accounts for 10.4% variance in IWB.

As shown by the results of the analysis, negative relationship could be observed between information processing and IWB, which suggests an increased in the information processing will result in reduced IWB. By definition, information processing is the extent to which “a job necessitates an incumbent to focus on and manage information”. Clarke & O’Brien (2012) the government relies on information to

provide services to citizens and in today's digital world, the aggressive data growth has resulted in a problem known as information overload. Spira (2011) stated that individual workers, teams, and entire organizations suffer diminished productivity and the loss of the ability to make sound decisions, process information, and prioritize tasks because of information overload. It was also found that 58 percent of government workers spend half the workday filing, deleting, or sorting information, at a cost of almost $31 billion dollars (Spira, 2011). It could be because of this reason, a negative and significant relationship could be observed between information processing and IWB.
Consistent with Russo (1986), Oldham & Cumming (1996) and Olhy & Fritz (2009), this study found a positive and significant relationship between task complexity and IWB. As explained by Russo (1986), a complex task will normally provide a better learning opportunity. Dealing with complex tasks will require creativity and strategy. In the process, an employee will explore all possibilities that will make the job done efficiently and effectively. As explained by Mulgan & Albury (2003), individuals can generate possibilities for innovation by observing and reflecting on what others are doing and thinking, and by benchmarking themselves against good practice.

Today's working environment requires that all individuals in an organization need to be prepared and equipped to meet the problem-solving challenges. As shown in this study, a positive and significant relationship was also found between problem solving and IWB. This finding further strengthens the findings of Livotov (2013) and Triyono et al., (2015) that innovative skills can be developed through problem solving skills. This finding suggests that as the problems that need to be solved increases in the job, the tendency to innovate will also increase sparingly.

Contrary to our expectations, the results of the analysis showed that, no significant relationship could be detected between skill variety and IWB; and between specialization and IWB. An increased or decreased in skill variety as well as specialization will give no effect to IWB. Upon further scrutiny, it was found that skill variety and specialization had a relatively higher mean score compared to innovation constructs. The interpretation of this could be that, because the respondents perceived that their job nature already requires high skill variety and high specialization, the need to innovate does not apply.

Conclusion

This study has contributed to the body of knowledge from both theoretical and practical perspectives. From the theoretical viewpoint, it has developed an empirical based framework connecting job design with IWB. The framework can be used in other studies involving different professions such as teachers, doctors or engineers. It would be equally appealing to also make a comparative study involving various knowledge workers. From the practical viewpoint, the study has provided empirical evidence on the contribution of job complexity, information processing and problem solving towards IWB. Given the findings, human resource managers, could identify the appropriate training required by the PTDs so as to increase their IWB.

Just like in any other study, there are several limitations associated with this study. Firstly, is in terms of the coverage of variables in work design. As shown in the instrument developed by Morgeson & Humphrey (2006), besides knowledge characteristics, there are other job design characteristics such as task characteristics, social characteristics, work context and equipment use. This study limit its scope to knowledge characteristics only, leaving other characteristics unexplored. Future studies should consider integrating these characteristics when studying IWB.

Acknowledgement

We would like to extend our greatest gratitude and appreciation to the Ministry of Education Malaysia for funding this research under Fundamental Research Grant Scheme (600-RMI/FRGS 5/3 (129/2013). Our thanks are also extended to the Research Management Institute (RMI), Universiti Teknologi MARA for their continuous help and assistance in the management of our expense of the research fund. Finally, we would also like to thank all Administrative and Diplomatic Officers who had participated in this study.

Abstract

While studies on innovation capabilities have been quite extensively reported in the literature, very few have attempted to examine the relationship between knowledge characteristics and innovation capabilities at the individual level perspective. Inspired by this research gap, this study examined knowledge characteristics, which are part of work design, on innovative work behavior (IWB). The research model along with hypotheses are developed from the literature and tested based on the data collected through a survey of officers working with the Malaysian federal government. The results suggest that three out of five knowledge characteristics, namely, job complexity, information processing and problem solving are significant predictors of innovative work behavior. The study did not find any support on the relationship between skill variety, specialization and innovative work behavior. This study has contributed to the body of knowledge from both theoretical and practical perspectives and should capture the interest of the researchers and practitioners.

Keywords : Work design, knowledge characteristics, innovation capability, knowledge management

Introduction

Innovation has been considered as the key factors for the survival, growth, and development of an organization. According to Mulgan & Albury (2003), in the private sector, the main motivation for innovation is "the need to maintain or increase profitability, which in turn provides an incentive to innovate to cut costs, improve market share and to create new products and services". In contrast, innovation in the public sector is equally because: (i) innovation will develop better ways of meeting needs, solving problems, and using resources and technologies, (ii) without innovation the inevitable pressures to contain costs can only be met by forcing already stretched staff to work even harder. Hence, innovation in the public sector will help increase the responsiveness of government services and keeping up with public needs and expectations (Mulgan & Albury, 2003).

Casebourne (2014) explained that innovation in the public sector is challenging because public services deal with complex problems and have contradictory and multifarious demands; and they need to respond quickly, whilst balancing the need for security and continuity, and must be transparent and accountable. Nonetheless, Borin (2001) found that 50% of the innovation in the public sector was initiated by front line staffs and managers**.** Innovation that is carried within the capacity of an individual employee is termed as innovative work behavior (IWB). The extant literature on IWB has paid much interest in the private sector. Even in the context of Malaysia, studies such as Kheng et al., (2013); Leong & Rasli (2013) and June & Kheng (2014) were mainly conducted involving employees of private companies.

Given this background, the situation of IWB among civil servants of the Malaysian government is still unknown. Driven by this gap, a study was undertaken with the aim of examining the relationship between knowledge characteristics as one of the components of job design, and IWB among officers of Malaysian federal government.

Literature Review

O'Sullivan & Doley (2009) defines innovation as the application of practical tools and techniques that make changes, large and small, to products, processes, and services that results in the introduction of something new for the organization that adds value to customers and contributes to the knowledge store of the organization. The Department of Innovation, Industry and Research of the Australian Government (2011) defined innovation as "the implementation of a significant change in the way an entity operates or in the products it provides. Innovations comprise new or significant changes to products, operational processes, organizational methods, or the way the entity communicates with users." Innovation can take place at various levels: individual, teams, departments or organization. An employee, within his individual capacity, can also involve in innovation activities aimed to improving his work performance. The innovative behavior, which is normally voluntary, can appear in the form of new methods or approach to execute tasks. In the context of public sector, Bartos (2002) defined innovation as a change in policy or management practice that leads to a lasting improvement in the level of service or quantity or quality of output by an organization.

De Spiegelaere et al., (2012) defined IWB as "all employees' behavior directed at the generation, introduction and/or application (within a role, group, or organization) of ideas, processes, products or procedures, new to the relevant unit of adoption that supposedly significant benefit the relevant unit of adoption". Individual characteristics, organizational characteristics and external characteristics have been found to have a bearing on the IWB. External characteristics, in the form of competitive pressures and socio-political pressures will create and increase the incentives towards organizational managers to make sure that their organizations are conducive for innovation to take place (Nijenhuis, 2015). Denti (2013) identified from a review, the individual characteristics that have an effect on IWB are personality; cognitive ability and style; intrinsic motivation; self efficacy; and task characteristics. Within the task characteristics, job complexity, information processing, problem solving, skill variety is among the factors that have shown to have a significant effect of IWB.

Theoretical Framework

Figure 1 presents the theoretical framework used in the study. The dependent variable is an IWB while the independent variable is the knowledge characteristics. Mulgan & Albury (2003) found that the majority of innovations in the UK public sector is incremental in nature, involving relatively minor changes to existing processes and services. Given the difficulty in measuring innovations in the public sector, Halvorsen et al (2005) suggests that when studying innovation in the public sector, 'one has by the outset removed oneself from the narrowest interpretations of innovation'. Hence, following Mulgan & Albury (2003), this study operationalized IWB as consisting of process innovation and service innovation.

According to Morgeson & Humphrey (2006), knowledge characteristics of work design "reflect the kinds of knowledge, skill, and ability demands that are placed on an individual as a function of what is done on the job". Accordingly, the authors categorized knowledge characteristics as comprising of job complexity, information processing, problem solving, skill variety and specialization.

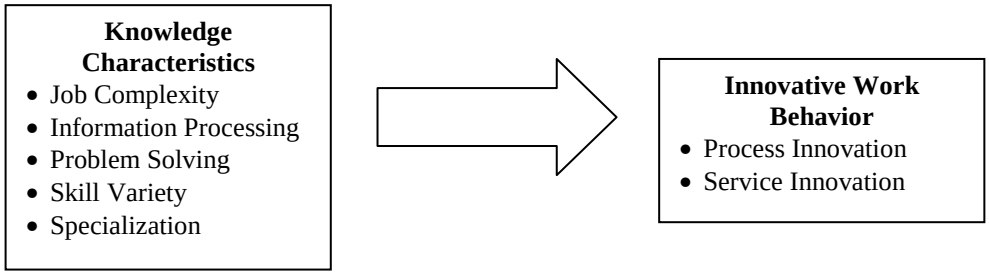

Fig 1. Theoretical Framework

Innovative Work Behavior

Nijenhuis (2015) defined IWB as all individual actions directed at the generation, processing and application/implementation of new ideas regarding ways of doing things, including new product ideas, technologies, procedures or work processes with the goal of increasing the effectiveness and success of the organization. Following Dorenbosch et al., (2005), IWB is conceived as a complex behavior comprising of four interrelated sets of behavioral activities, which are (i) problem recognition, (ii) idea generation, (iii) idea promotion and (iv) idea realization. The first two activities is also known as creativity oriented behavior while the last two activities are called implementation work oriented behavior. In the context of public sector organizations, the focus of innovation is on the process and service delivery.

A process innovation is the implementation of a new or significantly improved production or delivery method which includes significant changes in techniques, equipment and/or software (Tiwari, 2008). Process innovations "can be intended to decrease unit costs of production or delivery, to increase quality, or to produce or deliver new or significantly improved products" (Tiwari, 2008). Innovation in services involves transformation in a variety of aspects ranging from how the service is designed and developed to how it is delivered and managed (Miles, 2005). Service innovation can also be categorized based on the type of service that is innovated, namely, physical services, human services, and information services (Miles, 1993). Innovation in physical services involves physical transformation often through the adoption of new technologies, for example, radio-frequency identification (RFID) and refrigeration equipment. Innovation in human services takes the form of improvements in administrative data processing in public sector services and customized IT systems in medical services. Information services are mainly characterized by innovations in IT such as online banking in financial services and interactive digital media in entertainment (Miles, 2005).

Job Complexity

Job complexity refers to the extent to which the tasks on a job are complex and difficult to perform (Morgeson & Humphrey, 2006). A work that involves complex tasks and requires the use of numerous high-level skills will generally foster creativity because it develops self-efficacy of the employee. Oldham & Cumming (1996) asserted that, a complex task will reinforce employee's interest in the job, and the employee will be more motivated to be creative to achieve high performance. Russo (1986) discovered that job complexity may expose workers to new challenges and thus foster learning and skills development. Olhy & Fritz (2009) found that chronic time pressure and chronic job control, as well as daily time pressure are significantly correlated with daily creativity and proactive behavior, which are two important ingredients of an individual innovation capability. A meta-analysis by Hammond et al. (2011) shows that job complexity relates strongly to innovation capability. On the basis of the preceding discussion, the following hypothesis is put forward: H1: Job complexity is a significant predictor of innovation capability.

Information Processing

Information processing is the extent to which "a job necessitates an incumbent to focus on and manage information" (Humphrey et al., 2007). It also relates to the degree to which a job poses cognitive demands on employees in terms of monitoring and processing data or other information. In the knowledge management research "the personnel who specialize in strategic information processing" is called knowledge worker (Drucker, 1999). A study by Grant & Berry (2011) found that information processing skills are an important predictor of employee creativity. Tan et al., (2014) identified three important information capabilities that will drive digital social innovation as information literacy, information immediacy and information liberty. According to Smith (2000), innovation can be better understood as a process in which organization creates and defines problems and actively develops new knowledge to solve them. This will involve a lot of information procession activities where information is collected, analyzed and converted into pertinent knowledge. Vieites & Calvo (2011) showed that information management, which also include information processing, is a significant predictor of a firm's innovation capability. To this effect, the following hypothesis is established: H2: Information processing has a significant relationship with IWB.

Problem Solving

Problem solving is the extent to which a job requires the production of unique solutions or ideas (Humphrey et al., 2007). According to Humprey et al., (2007), problem solving is conceptually identical to creativity as it involves innovating, solving non-routine problems, and preventing errors. A review study by Griffin & Guez (2014) discovered that problem solving is determined by the same underpinning mechanisms, and is influenced by the same factors, as those predicted to underpin, and to influence, innovation. Jabri (1991) categorized two types of problem solving styles, namely, associative and bisociative thinking. Associative thinking represents a systematic problem-solving style, based on the following of habit or a set of routines, adherence to rules and the adoption of disciplinary boundaries while using rationality and logic. On the other hand, bisociative thinking represents intuitive problem-solving style, is characterized by "a tendency to combine separate domains of thought at the same time, a low attention to existing rules and disciplinary boundaries and a tendency towards imagination and intuition". It is believed that between systematic and intuitive problem solving style, the former will tend to inhibit innovative behavior (Scott & Bruce, 1994). Livotov (2013) and Triyono et al., (2015) found that innovative skills can be trained and developed through problem solving skills. Against this backdrop, the following hypothesis is developed: H3: Problem solving has a significant relationship with IWB.

Skill Variety

Skill variety relates to "the extent to which a job requires an individual to use a variety of different skills to complete the work" (Hackman & Oldham, 1980). The authors further stressed that high level of skill variety is expected to support and encourage higher levels of motivation and creativity than are relatively simple and routine jobs. The theory behind providing skill variety in job design is that it will reduce boredom, thereby increasing job satisfaction and motivation. According to Lunenburg (2011), jobs that are high in skill variety are seen by employees as "more challenging because of the range of skills involved; relieve monotony that results from repetitive activity; and gives employees a greater sense of competence". Kassem & Sarhan (2013) discovered that skill variety is significantly related to job performance. Hessels et al., (2014) showed entrepreneurs with skill variety are better positioned to introduce innovations that have technical and commercial values. In another study involving managers, Deegahawature (2014) found that skill variety is a significant predictor of manager's inclination towards open innovation. Drawing upon these justifications, the following hypothesis is established: H4: Skill variety has a significant relationship with IWB.

Specialization

While skill and skill variety relates to the breadth of behaviors and skills involved in a job, specialization represents the depth of knowledge and skills necessary (Humprey et al., 2007). It is also defined as the "extent to which a job involves performing specialized tasks or possessing specialized knowledge and skill" (Morgeson & Humphrey, 2006). Job specialization increases output because workers do not lose time shifting among different tasks and workers with specialties are more likely to be creative and innovative in making their tasks more efficient. According to Adeyoyin et al., (2015), when an organization uses job specialization, every worker is an expert to some degree and employees are able to refine the task for which they are responsible, resulting in increased efficiency and increased production. Their study in the context of a library found that specialization is associated with job satisfaction. In an earlier study, Stats & Gino (2010), found that specialization is correlated with job productivity among employees in Japanese banks. Given the aforementioned arguments, the researcher hypothesized the following: H5: Specialization has a significant relationship with IWB.

Research Methodology

This study used a quantitative approach with a survey research method. The instrument used for collecting the data was a questionnaire, adapted from Morgeson & Humphrey (2006) and Easa (2012). Perceptual measures in the forms of items or statements with corresponding Likert scale were used to measure each construct or variable. For each statement, the respondents were requested to indicate on a seven point scale, the extent they agree or disagree with the statement. The process of developing the questionnaire involved pre-testing and pilot testing. The pre-testing were executed with several experts from the academia and senior officers working with the federal government. The aim of the pre-testing exercise was to assess the content validity and face validity of the questionnaires. Feedbacks obtained during a face-to-face meeting in the pre-testing exercise was used to revise and refine the questionnaire. Accordingly, the questionnaire was pilot tested with 36 officers working with deferral government. Based on their responses the Cronbach's alpha of each construct in the framework was examined. The results as shown in Table 1 suggest that the instrument was highly reliable because the Cronbach's alpha are well above 0.7.

The population of the study was the Administrative and Diplomatic Officers or better known as "Pegawai Tadbir dan Diplomatik" (PTD), working with the ministries of the federal government located in Putrajaya Malaysia. They were chosen because the nature of their jobs which mainly focused on structuring, implementing and managing the country's public policies, including strengthening the administrative functions, social infrastructures and also the performance of economic growths (Pegawai Tadbir dan Diplomatik, 1999). As the main policy makers of the Malaysian government, the PTDs are expected to continually re-invent and innovate the government processes and services, so as to meet with the current challenges faced by the country.

Using the stratified random sampling, a total of 548 questionnaires was distributed to targeted respondents. Several representatives were appointed to distribute and collect the questionnaires in each ministry. A total of 421 questionnaires was returned, giving a response rate of 76.8 %. However, out of this number, 116 questionnaires had to be removed as more than 20% of the questions were not answered, leaving a total usable rate of 72.45% (305). The total number is considered reasonable and in accordance with Sekaran (2003), who suggested that the response rate need to be at least 15% of the total population. The usable questionnaires were then analyzed statistically using IBM SPSS Version 20 and SmartPLS Version 3.0. The IBM SPSS was used for descriptive analysis while SmartPLS was used for measurement model or confirmatory factor analysis (CFA) and hypothesis testing. SmartPLS is a professional statistical software package that enables users to do Structural Equation Modeling (SEM) or PLS path modeling.

Findings

Common Method Bias

Given that this study used common rater (i.e. the same respondent answering all questions in the questionnaire), the need to examine the possibility of the problem of common method bias is therefore crucial. Podsakoff et al., (2003) suggested the use of Harman's single factor test, which requires that the total variance explained for all items when constrained to single construct should not exceed 50%. The results of the Harman's single factor test indicate that the total variance is about 33.3%, which met the recommended value. Thus, it can be concluded that the questionnaire used in the study is free from the problem of common method bias.

Demographic Profiles of Respondents

Out of 305 respondents, 51.1% were female and the remaining 48.9% were male. The breakdown of the respondents' age is as follows: 30 to 34 years (35.7%), 35 to 39 years (18.4%), 40 to 44 years (6.6%), 45 to 49 years (3.3%), 50 years and above (3.3%) and less than 25 years (1.0%).

Hypothesis Testing

Prior to testing the research hypothesis, the path model needs to be assessed in terms of its convergent validity and discriminant validity. According to Anderson & Gerbing (1988), convergent validity is the degree to which different methods used to measure the same construct produce similar results. Convergent validity is used to check the loading of each observed indicator on their underlying latent construct. The convergent validity is normally assessed through composite or construct reliability (CR) and average variance extracted (AVE). Construct reliability measures the internal consistency of a set of measures rather than the reliability of a single variable. The average variance extracted (AVE) measures the total amount of variance in the indicators accounted for by the latent variable. The value of composite reliability (CR) above 0.70 or higher suggests good reliability and values between 0.60 and 0.70 is considered acceptable (Hair et al., 2010). The average variance extracted (AVE) of less than 0.50 or higher is a good rule of thumb, suggesting adequate co-variance (Hair et al., 2006). In this study, both CR and AVE were assessed to address the convergent validity of measures.

Another aspect of validity that needs assessment is discriminant validity, defined as the extent to which a construct is truly distinct from other constructs (Hair et al., 2010). According to Hair et al., (2010) the best approach to assessing the discriminant validity is to compare the square root of each construct AVE to its correlation with other variables. This approach requires that the value of the square root of each construct AVE should be higher than the correlation values among constructs. If this requirement is met, discriminant validity can be assumed. This study also used this approach for assessing the discriminant validity. Figure 2 and Table 1 presents the results of the assessment of the measurement model. The factor loadings for all items surpassed the recommended value or 0.7; the AVE for all construct surpassed the recommended value of 0.5; and the CR for all constructs exceeds the recommended value of 0.7. Table 2 shows that the square root of each construct AVE is higher than the correlation with other variables.Given these results, a convergent validity and discriminant validity of the instrument can be assumed.

Table 1: Assessment of Convergent Validity

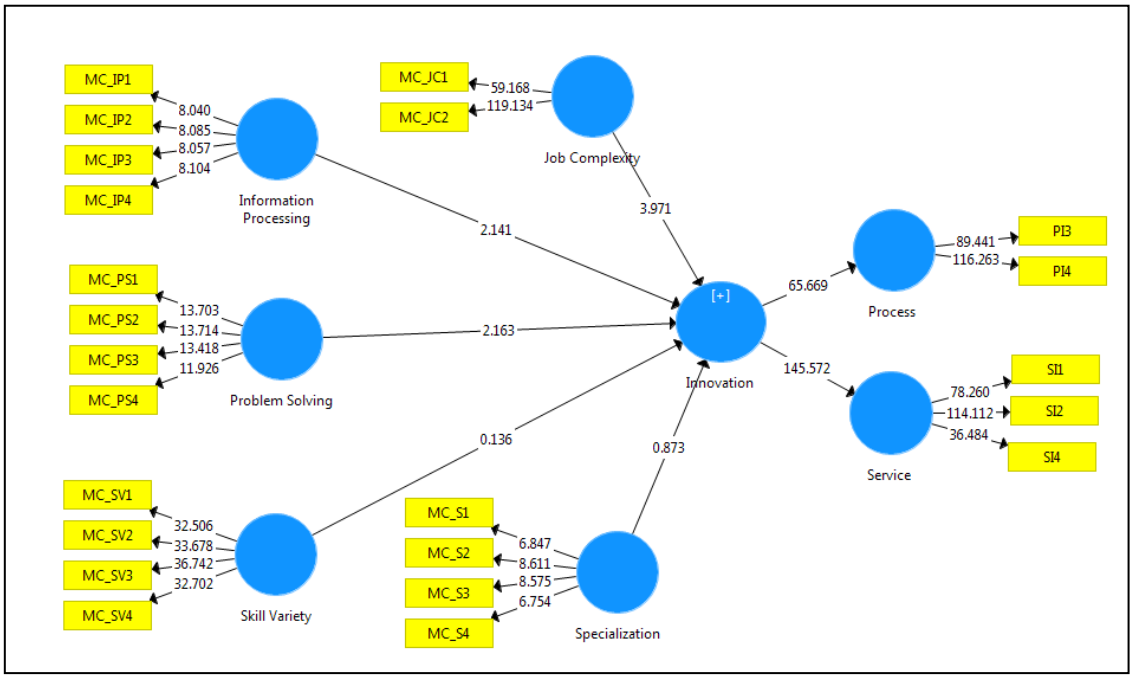

Fig 2. SmartPLS outputs of Bootstraping

Table 3 presents the results of the path analysis or the structural model. Hair et al., (2014) suggested that assessing the structural model involves evaluating the R^2, beta (β) and corresponding t-values. To obtain the t-value, a bootstrapping procedure with 5,000 resamples were executed. The result of the bootstrapping procedure is shown in Table 3. According to hair et al., (2014), the t-statistic value should be greater than 1.96 for the path to be significant. Out of the five analyzed paths, three paths are significant while the other two are not significant ($p > 0.05$). The significant paths are: between

information processing and IWB; between job complexity and IWB; between problem solving and IWB. The insignificant paths are: between skill variety and IWB; between specialization and IWB. With these results, H1, H2 and H3 are supported while H4 and H5 are not supported. The explanatory power of the estimated model can be assessed by observing the R^2 of the endogenous construct i.e. the IWB. For a substantial model, Cohen (1988) suggests that R^2 should be about 0.35 or greater, while Falk & Miller (1992) recommended 0.10 or above. In this study, the R^2 is 0.104, indicating that the estimated model is substantial.

Table 3: Path Coefficients

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P Values
Information Processing →IWB	-3.015	-2.644	1.378	2.187	0.029
Job Complexity → IWB	0.242	0.237	0.062	3.895	0.00
Problem Solving → IWB	3.213	2.861	1.351	2.379	0.018
Skill Variety → IWB	-0.155	-0.172	1.028	0.151	0.880
Specialization → IWB	0.051	0.069	0.066	0.771	0.441

Effect size refers to whether the latent independent variable has a considerable effect on the dependent variable. Using the formula $f^2 = R^2/(1-R^2)$ by Cohen (1988), the effect size is computed and the results showed that the effect is either none or small (Table 4). To interpret the impact of f^2 at the structural level, it has been suggested that the effect is large when f^2 is 0.35 or above, medium when f^2 is between 0.15 and 0.349, and small when f^2 is 0.03 or less (Cohen 1988).

Table 4. Assessment of effect size

Model	Variables Included	Variables Excluded	R Square	Effect size (f^2)	Interpretation
1	Job complexity, problem solving, skill variety, specialization	Information processing	0.075	0.0324	Small
2	Information processing, problem solving, skill variety, specialization	Job complexity	0.069	0.0391	Small
3	Information processing, job complexity, skill variety, specialization	Problem solving	0.085	0.0212	Small

Discussion

The objective of the study was to examine the relationship between knowledge characteristics and IWB among officers of Malaysian federal government. Drawing upon the job design framework, knowledge characteristics were classified into five dimensions: job complexity, information processing, problem solving, skill variety and specialization. From the results of the analysis, it was shown that job complexity, information processing and problem solving does have a significant relationship with an IWB. The combination of these three constructs accounts for 10.4% variance in IWB.

As shown by the results of the analysis, negative relationship could be observed between information processing and IWB, which suggests an increased in the information processing will result in reduced IWB. By definition, information processing is the extent to which “a job necessitates an incumbent to focus on and manage information”. Clarke & O’Brien (2012) the government relies on information to

provide services to citizens and in today's digital world, the aggressive data growth has resulted in a problem known as information overload. Spira (2011) stated that individual workers, teams, and entire organizations suffer diminished productivity and the loss of the ability to make sound decisions, process information, and prioritize tasks because of information overload. It was also found that 58 percent of government workers spend half the workday filing, deleting, or sorting information, at a cost of almost $31 billion dollars (Spira, 2011). It could be because of this reason, a negative and significant relationship could be observed between information processing and IWB.
Consistent with Russo (1986), Oldham & Cumming (1996) and Olhy & Fritz (2009), this study found a positive and significant relationship between task complexity and IWB. As explained by Russo (1986), a complex task will normally provide a better learning opportunity. Dealing with complex tasks will require creativity and strategy. In the process, an employee will explore all possibilities that will make the job done efficiently and effectively. As explained by Mulgan & Albury (2003), individuals can generate possibilities for innovation by observing and reflecting on what others are doing and thinking, and by benchmarking themselves against good practice.

Today's working environment requires that all individuals in an organization need to be prepared and equipped to meet the problem-solving challenges. As shown in this study, a positive and significant relationship was also found between problem solving and IWB. This finding further strengthens the findings of Livotov (2013) and Triyono et al., (2015) that innovative skills can be developed through problem solving skills. This finding suggests that as the problems that need to be solved increases in the job, the tendency to innovate will also increase sparingly.

Contrary to our expectations, the results of the analysis showed that, no significant relationship could be detected between skill variety and IWB; and between specialization and IWB. An increased or decreased in skill variety as well as specialization will give no effect to IWB. Upon further scrutiny, it was found that skill variety and specialization had a relatively higher mean score compared to innovation constructs. The interpretation of this could be that, because the respondents perceived that their job nature already requires high skill variety and high specialization, the need to innovate does not apply.

Conclusion

This study has contributed to the body of knowledge from both theoretical and practical perspectives. From the theoretical viewpoint, it has developed an empirical based framework connecting job design with IWB. The framework can be used in other studies involving different professions such as teachers, doctors or engineers. It would be equally appealing to also make a comparative study involving various knowledge workers. From the practical viewpoint, the study has provided empirical evidence on the contribution of job complexity, information processing and problem solving towards IWB. Given the findings, human resource managers, could identify the appropriate training required by the PTDs so as to increase their IWB.

Just like in any other study, there are several limitations associated with this study. Firstly, is in terms of the coverage of variables in work design. As shown in the instrument developed by Morgeson & Humphrey (2006), besides knowledge characteristics, there are other job design characteristics such as task characteristics, social characteristics, work context and equipment use. This study limit its scope to knowledge characteristics only, leaving other characteristics unexplored. Future studies should consider integrating these characteristics when studying IWB.

Acknowledgement

We would like to extend our greatest gratitude and appreciation to the Ministry of Education Malaysia for funding this research under Fundamental Research Grant Scheme (600-RMI/FRGS 5/3 (129/2013). Our thanks are also extended to the Research Management Institute (RMI), Universiti Teknologi MARA for their continuous help and assistance in the management of our expense of the research fund. Finally, we would also like to thank all Administrative and Diplomatic Officers who had participated in this study.

Abstract

Knowledge based economy forces companies to reconsider strategic impact of different components of internal capital on their performance. Traditional extensive value drivers, based mainly on structural capital, are gradually extended with more intensive utilization of relational and human-resources oriented alternatives also in hospitality industry. Applying the elements of green management and sustainable development principles are characteristic trends in accommodation services. The current approach to hotel management is mostly revenue-oriented, i.e. strives to generate profit from temporally and locationally specific combinations of internal, technical and social capabilities, including, e.g. market segmentation, pricing, capacity allocation, aligned incentives, organizational structure or vocational training. Accordingly, present managers maximize metrics like occupancy (OCC), average daily rate (ADR), revenue per available room (RevPAR), revenue per available customer (RevPAC), gross operating profit per available room (GOPPAR) and many others. The paper deals with an application of green management elements in luxury class hotels in Slovakia. We used the methods of scientific work; and i.e.; the analysis method, a generalization method, mathematical, and statistical methods. Surveyed accommodation facilities reached the best results with compact fluorescent lamps and LED lamps (98 %) and sorting containers (90 %). Based on the ascertained facts, we state that accommodation facilities in Slovakia should definitely invest in the green initiatives.

Keywords: Eco-friendly accommodation facility, green management, hotel industry.

Introduction

Sustainability is currently one of the major priorities of tourism all over the world. One part of sustainable tourism is green management. Stakeholders in tourism are increasingly aware of their impact on the environment. Therefore they get involved in various voluntary programs, where they seek appropriate measures by which to contribute to improving the environment at the local and national level. A lot of accommodation facilities are turning green at an increasing rate due to an unprecedented reason, which is not directly based on profitability, longevity, or sustainability.

Environmental issues of the world have become the key topic of everyday conversation. There has recently been much discussion about the question if business in Western society can be transformed into environmentally responsible accommodation facilities (Rojšek, 2001). Applying the elements of green management is one of the characteristic trends in accommodation services. We can find them particularly in large hotel chains but accommodation facilities with small capacity are also interested in this green way. These accommodation facilities are aware that the importance of environmental protection is necessary; moreover they use this concept as a useful marketing tool for distinguishing from other accommodation facilities (Scholz, 2015a). Great pressure is directed mostly towards the hospitality which is considered to be one of the main sources of pollution (Rojšek, 2001; Graci, 2010).

Green management in accommodation facilities

Nowadays we can hear or read that green is in. Green is in vogue. A lot of consumers are asking for it. Organizations are requesting it. The future of business is being built on green and social responsible organizations. The green bandwagon is overloaded with posers and images of green without the true understanding of what green means, the methodologies of achieving green, and the applicability of green management (Tran, 2009). Despite the opportunity, some hotel managers remain hesitant to invest in green initiatives because they are not convinced whether or not such investments are financially beneficial. That is, while implementation of some new green practices and elements requires significant initial investments, quantifying returns is often difficult for investments which produce less tangible results such as improvement to a firm's reputation for being conservation oriented (Bird et al., 2007).

On the other hand, the laws or regulations of most countries do not have a legal or a universally accepted definition of what is a "green accommodation facility or eco-friendly hotel". It means that the practice of using "green or eco-friendly" as a marketing ploy is still widespread in many cities and towns around the world. A lot of hotel managers are claiming that they are "green or environmentally friendly" by simply hanging a sign and declaring themselves to be green (Pizam, 2008). Other accommodation facilities are claiming to be green also by the simple practices like changing the linens less frequently, reducing the flow of water saving perlators or shower heads, usage of the compact fluorescent lamps and LED lamps etc. But these activities we cannot signify for entirely correct statements of eco-friendly accommodation facility. In our opinion, the basic definition of this eco-friendly accommodation facility is an environmentally responsible accommodation for that follows the practices of sustainable living and has the certification of the European Union - The Flower or other ecological certificate.

A number of measures to protect the environment is focused on reducing energy (Chan and Lam, 2003; Khemiri and Hassairi, 2005; Ali et al., 2008, Scholz, 2014), water (Deng and Burnett, 2002; Gössling et al., 2015; Reddy and Wilkes, 2015), chemicals, office supplies, reduction of waste (Wie and Shanklin, 2001; Chan and Lam, 2001), increasing the proportion of natural materials, aestheticisation environment, reducing noise and emissions (especially carbon emissions), etc. (Patúš and Gúčik, 2004; Hillary, 2004; Bohdanowicz, 2005; Mensah, 2006; Chen and Hsieh, 2011; Scholz, 2015b). Global Carbon Atlas shows that world produced 35.890 billion tons of carbon emissions in 2014. We can state that China´s total emissions lead the world but when diluted by its huge population, its ranking drops down the per capita list. The United States is No. 2 for total emissions but Americans shrink down to a respectable rank in line with other industrialized citizens. On the other hand, Gibraltar tops per capita list due to its need to import most manufactured good – a reality also seen in many small island nations. The largest emitters worldwide by country: China 9.681 billion tons of carbon emissions, United States 5.561; India 2.597; Russia 1.595; Japan 1.232; Germany 0.641; Iran 0.616, and Saudi Arabia 0.602. In comparison Slovakia has value of carbon dioxide only 0.032.

It is necessary to focus on waste separation and reuse of recycled material, energy and water savings (table 1).

Table 1: Green management elements

Area	*Elements*
Economic and social activities	- purchase of raw materials and products in the region, - support local infrastructure, - use of public transport and bicycles, - employment of local population.
Communication and education of employees and guests	- workflows and their control, - promotion of ecological program to the public, - compliance with environmental principles by guests and employees.
	- implementation of ISO 14001, Eco-Management and Audit Scheme, - purchase larger volumes and minimizing packaging,

Management	- purchase products that really need accommodation facilities, - purchase products from suppliers in the region, - purchase quality and truly useful products, - purchasing of environmentally friendly products, - measuring guests´ satisfaction.
Waste management	- waste separation in the background of hotels, - sorting bins for plastic, paper, etc. in each room, - reuse recycled materials, - composting organic waste.
Energy savings	- utilization of geothermal energy and waste heat, - regulating heating and air conditioning, - compact fluorescent lamps, - appliances min. class A (A +, A ++), - low energy technologies, - thermal insulation of buildings.
Water savings	- installation of single-lever mixers and perlators - installation of energy-saving shower heads, - installation of two-stage flush toilets, - gray-water reuse, - rainwater harvesting.

Source: Processed under Belešová, 2014; Scholz, 2014.

Accommodation facilities tend to apply differently in the selection of saving measure. Some hotels and guest houses are decided according to what is currently the most urgent; others focus on measures that will bring the biggest savings at the lowest cost. A lot of accommodation facilities invest financial resources into the lighting, where they can attain significant savings. Incandescent bulbs are most often replaced with the compact fluorescent lamps. They reach about 80 % less energy consumption compared to the incandescent lamp for the same light flux and also significantly lower power dissipation.

Another advantage of the compact fluorescent lamps is that they have a considerably longer service life, which reaches an average of 6,000 hours of lighting. However, they are currently increasingly coming to the forefront of LED technology (Light Emitting Diode). Compared to the common light sources, their durability is much higher. However, it should not be installed at the places where there is frequent switching off lights. What is more, the lifetime of LED lamps is in the range 30,000 to 100,000 hours of lighting, but the product which promises life of 100,000 hours are often not very reliable. The usual lifetime of LED lamps is around 30,000 hours, but it also may be lower or higher.

Accommodation facilities in the Tourist class and Economy class are not so much interested in applying elements of green management. We state that situation is different by accommodation facilities which offer higher quality and more additional services. Accommodation facilities in the Standard class and First Class begin or have already begun to implement environmental management which results from the moral, social and political reasons. For accommodation facilities, it is not easy to implement environmental management. Managers even though start to be creative of the utilization of existing materials and convert to efficient and environmentally friendly. We can see economics advantages in eco-friendly accommodation facilities, too (Scholz, Voráček, 2015).

In Slovakia, there is only one accommodation facility which is certified by The Flower system. In the European Union, there is also utilization of the certification of Environmental Management System, in the United States of America there is well-known LEED certification (Leadership in Energy & Environmental Design).

The hotel sector is comprised of both independent and chain hotels (Scholz, Voráček, 2015). Mainly chain hotels are also increasingly subscribing to eco-labelling and certification schemes (Hamele, 2004 in Mensah, 2013). In Europe, there are over 600 accredited facilities. We state that France is the country with the highest number of accommodation facilities (352) with ecological certificate in

2015. Especially, Region of Brittany, Provence-Alps-Côte d'Azur, Aquitaine, and Poitou-Charentes there is the highest number of accommodation facilities with ecological certificate of the European Union - The Flower. If we focus on some selected European countries, we can see in several countries between the years 2007-2014 a significant increase in the accommodation facilities which have the ecological certificate of the European Union (table 2)

Table 2: Number of eco-friendly accommodation facilities in selected European countries

No.	*Country*	*2014*	*2007*	*Index in %*

Source: Processed under European Commission, 2016.

We note that in 2007, there is the biggest number of the eco-friendly accommodation facilities in Italy (25), Ireland (11), Austria (7), Switzerland (6), Netherlands (6), and Denmark (5). It is remarkable that countries that are more environmentally friendly have a minimum of these eco-friendly accommodation facilities - Germany (2), Finland (0), Sweden (0), and Norway (0). Comparing the countries in 2014 (data from all mentioned countries are still not available in 2015), it was Italy in the first place, which increased the number of eco-friendly accommodation facilities by almost 100 accommodation facilities, i.e. an increase of 496 %. The most striking development was recorded by France with 104 environmentally friendly accommodation facilities. Compared to 2007, there were only 2 eco-friendly accommodation facilities; it means the increase of 5,200 %. Switzerland recorded the increase of 617 %, Spain the increase of 500 %, the Czech Republic increased by 300 % and Austria by 243 %. We also noticed some declines e. g. Ireland and Denmark. Norway, which is considered as a leader in connection of ecology, there is no accommodation facility certified by The European Union. But we have to state that in the figure 2, there are only collected accommodation facilities with a European Ecolabel. Therefore, e.g. countries of the Scandinavian Peninsula of northern Europe did not reach better results.

We assume that these countries have a national certificate for accommodation facilities with an eco-friendly approach to the environment. In Norway, Sweden and Finland, the measures for supporting the environment are basically implemented automatically and it is not necessary to own an environmental certificate. Several accommodation facilities in the Czech Republic and Slovakia are in line with this philosophy. They use some measures and elements of the green management but do not own a certificate due to its high financial expenses. In the countries of the Western and Northern

Europe, the guests are different, because they are interested and seek eco-friendly accommodation facilities, whereas for Czech or Slovak guests the most decisive factor is predominately the price.

But green management is not the repackaging, the reinventing approaches to business, nor business management. Green management is not a concept describing new business management style. Green management is simply the rethinking, or more accurately, being more mindful of how accommodation facilities are operating (or a lack thereof) with respect to the environment (Tran, 2009).

Objectives and methodology of the research

The aim of this paper is to analyze the implementation of the green management elements in luxury class hotels in Slovakia. There were used primary data collected by questionnaire survey and secondary data. The questionnaire survey consisted of twelve questions. They were mostly closed and some were half open questions. At the end of the questionnaire there were three segmentation questions and respondents had space for their views and comments. The primary survey was conducted in Slovakia. We used PAPI, CAPI, and CAWI methods. Paper and pencil interviewing (PAPI), data obtained from the interview is filled in on a paper form using a pencil. Computer-assisted personal interviewing (CAPI), this method is very much similar to the PAPI method, but the data is directly entered into a computer program instead of first using paper forms. CAPI was developed to reduce the time needed to collect and process survey data, to improve the quality of the information collected, to reduce survey costs, and to implement more complex questionnaire designs than are possible with paper and pencil (Baker, 1992). Computer-assisted web interviewing (CAWI) is an Internet surveying technique in which the interviewee follows a script provided in a website. The questionnaires are made online for creating web interviews (e.g. google). The website is able to customize the flow of the questionnaire based on the answers provided, as well as information already known about the respondent. It is considered to be a cheaper way of surveying since one does not need to use respondents to hold surveys unlike computer-assisted telephone interviewing (Reips, 2000). The survey was conducted since September 2014 until August 2015. In Slovakia, there are located 10 accommodation facilities in Luxury class. We contacted these 10 luxury class hotels; 100 % of them answered willingly. We used the methods of scientific work; and i.e. the analysis method, a method of generalization, mathematical, and statistical methods. In Slovakia, there are over 3,100 accommodation facilities; 10 Luxury class hotels, 130 First Class hotels, 278 hotels in the Standard class, 106 hotels in the Economy class, and 89 hotels in the Tourist class. Furthermore, in Slovakia, there are located 749 guest houses, 295 hostels, 56 hostels dwellings, 63 campings and encampments, 591 accommodation facilities in private, and 778 other (*Statistical Office of the Slovak Republic).*

Results and discussion

Accommodation facilities that utilize elements of the green management have a certain competitive advantage. Their goal is to apply the different elements of green management and contribute to the environmental protection. The highest representations of accommodation facilities in our sample were noted in the accommodation facilities located in towns (7), rural areas (1), mountains (1), and spa (1). The results of the research can be summarized as follows:

- 98 % of luxury class hotels use compact fluorescent and LED lamps,
- 90 % of luxury class hotels have sorting containers,
- 89 % of luxury class hotels reduce the flow of water saving perlators or shower heads,
- 87 % of luxury class hotels have their own heating control in each room,
- 82 % of luxury class hotels have windows thermal insulation,
- 72 % of luxury class hotels minimize the use of disposable products,
- 67 % of luxury class hotels use cleaning products and laundry detergents friendly to the environment,
- 62 % of luxury class hotels educate employees to green management,
- 53 % of luxury class hotels inform guests about environmental efforts, and

- 45 % of luxury class hotels have implemented environmental housekeeping.

Surveyed accommodation facilities in luxury class have the best results with compact fluorescent lamps and LED lamps (98 %), sorting containers (90 %), and reducing the flow of water saving perlators or shower heads (89 %). We are surprised that 87 % of luxury class hotels had individual heating control installed in the rooms. If the room is not occupied by the hotel guests, it is not environmentally friendly to use the air conditioning or heating in the room. It is completely sufficient if the heating or air conditioning is turned on a few hours before the expected arrival of the guests. Over three quarters of luxury class hotels (82 %) use windows thermal insulation.

Rather worse results were found in the environmental housekeeping (45 %), informing of guests about environmental efforts (53 %), education of employees to the green management (62 %), and the friendly cleaning products and laundry detergents (67 %). But these results are still at a good level.

Generally, we state that the surveyed accommodation facilities reached very good results, sometimes there were found even outstanding results. In comparison with the research performed by Scholz (2015), who dealt with the same issues in the accommodation facilities (Luxury class) in the Czech Republic, we expected similar results.

Accommodation facilities in the Czech Republic reached better values with the following environmental measures: compact fluorescent lamps and LED lamps (100 % x 98 %), sorting containers (100 % x 90 %), windows thermal insulation (100 % x 82 %), green management employees education (82 % x 62 %), and implementation of environmental housekeeping (66 % x 45 %). With cleaning products and laundry detergents friendly to the environment we marked similar results. The biggest difference we can note with reducing the flow of water saving perlators or shower heads. Almost 9/10 of luxury class hotels (89 %) in Slovakia reduce the flow. In the Czech Republic there is only one third of luxury class hotels which reduce the flow of water saving perlators or shower heads (fig. 1).

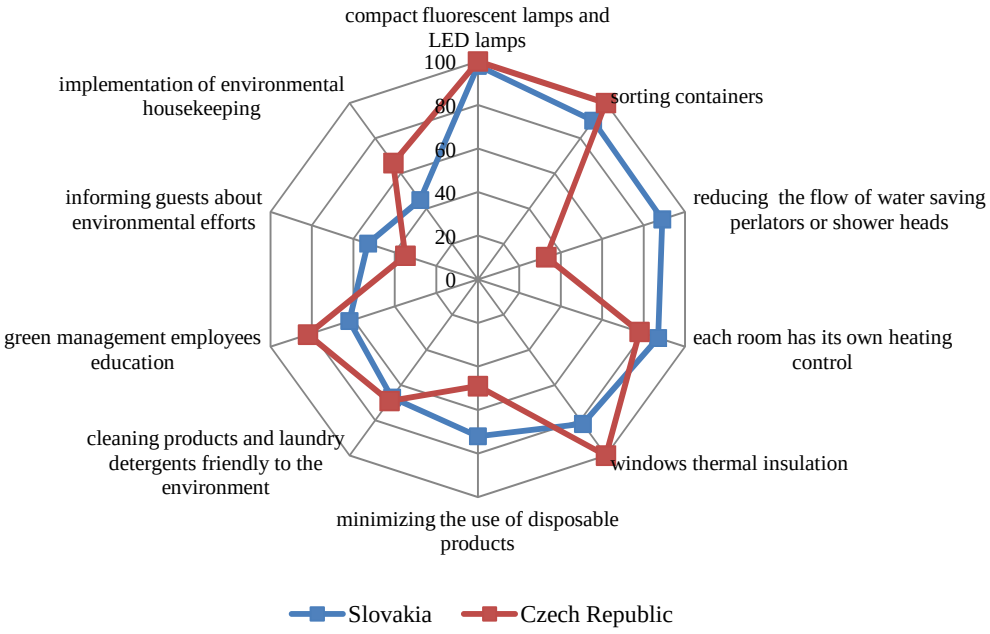

Figure 1: Environmental measures used in accommodation facilities in Slovakia in percentage

Source: Own elaboration, 2015.

Water saving perlator can save up to 70 % reduction in water consumption sinks and kitchen sinks without sacrificing user comfort. Water saving shower head reduces the consumption by 40 % i.e. at 12 to 15 liters per minute compared to classic traditional shower head, in which is the water consumption about 20 liters per minute. Funds in these facilities is not high, the costs are altogether approximately 20 €.

Conclusion

Based on the ascertained facts, surveyed accommodation facilities reached very good results, sometimes there were found even excellent results, especially with compact fluorescent lamps and LED lamps (98 %), sorting containers (90 %), and reducing the flow of water saving perlators or shower heads (89 %). Accommodation facilities should prefer Slovak products and local specialties while purchasing raw materials and products; try to support local infrastructure, promote ecological program to the public and green management implementation. Green management extends the portfolio of services in the accommodation facilities. We can state that a greener workplace can mean a lighter ecological footprint, a healthier and more productive place to work, and finally better conditions for employers, employees, and guests. Moreover, eco-friendly accommodation facility, managed in such way is internally stable and robust, which support its planning and improvement processes. We can state that accommodation facilities in Slovakia should definitely invest in the green initiatives. Generally, it may be a complementary service of a hotel, which serves to satisfaction of the customer's beliefs or values such as respect. But environmental protection is not definitely running for a short distance.

Succession Planning and Capital Structure of Family-Owned Businesses in the UAE

Sherine Farouk Abdel All, Abu Dhabi University, Abu Dhabi, United Arab Emirates
Iliya Nikolov Komarev, Abu Dhabi University, Abu Dhabi, United Arab Emirates

Abstract

This short paper presents the preliminary results of a study aiming to examine how effectively the United Arab Emirates' (UAE) family-owned businesses plan and manage the succession of their historic founders. In addition to analysing the transfer of knowledge and skills from the incumbent manager-owner to the new generation, we also examine the major factors affecting the decision of current and future capital structure of the company. For this purpose we plan to perform several case studies of family-owned businesses established in the UAE. Our preliminary findings show important influence of the local culture on the succession planning. The preferred successor is involved quite early in the management of the business in order to facilitate the transfer of knowledge and skills. However, the capital of the firm is rarely opened outside the immediate heirs.

Keywords: family ownership, succession, culture, capital structure

1. Introduction

The government of the United Arab Emirates (UAE) has pledged a strategic shift from a fossil energy-based to a "sustainable and diversified economy", "driven by entrepreneurs" (UAE, 2010). An important factor for the success of this vision is the further development of the multitude of local family-owned businesses (FOB) which are expected to constitute a major pillar of the future diversified economy. Indeed, some professional sources claim that around 75% of the private businesses in the countries of the Gulf Cooperation Council (GCC) are family-owned (Garbois et al., 2011; Wilkinson, 2015). Other sources estimate that this share in the UAE is close to 90% (Bodolica et al., 2015).

More importantly, many of the FOBs in the UAE are going to face succession challenges in the end of the current or the beginning of the next decade (Swan, 2013). This intergenerational transfer is extremely important because the federal government places grate hopes in the FOBs for the diversification of the economy. On the other hand, on the international scene, empirical studies have shown that only a third of the FOBs are transferred to the second generation, and less than 10% survive to the third generation (Le Bretton-Miller et al. 2004).

To face this succession challenge, the UAE government has made significant efforts in developing the financial markets and institutions of the country, essential in securing financing for the local businesses. However, the successful succession of FOBs usually requires more than just funding. It is important to prepare the family and the successor through careful planning, education and involvement in the business. It is also crucial to consider how the cultural and legal context of the country can affect the execution of the succession plan (Le Bretton-Miller et al. 2004).

Given the specific cultural, legal and economic context of the UAE, this study aims to examine to what extent the major drivers for an effective succession of family-owned businesses in the country are similar to or different from those found in other international studies. Moreover, the study will examine the conditions leading to the introduction of a non-family chief executive and those leading to changes in the capital structure of the family-owned firm after succession. To the best of our knowledge, this would be the first study analysing thoroughly this topic in the case of the UAE. Therefore we expect our conclusions to be useful not only for the numerous FOBs facing a succession challenge in the near future, but also for the policymakers in the country who need to adapt the financial, legal and educational infrastructure to face these challenges.

2. Literature review

The question of the determinants of an effective succession planning has attracted significant amount of academic interest in the last three decades (Le Breton-Miller et al., 2004). This literature has established several best practices which would allow the incumbent manager-owner to effectively transfer the managerial knowledge and skills along with the ownership rights, while avoiding conflicts within the family. Nevertheless most of this research relates to the succession planning in western economies.

An important question for FOBs facing generational change is the financing of this process (Koropp et al., 2013) as well as the future capital structure of the family firm (Molly et al., 2010; Amore et al., 2011). The agency theory predicts that agency conflicts are reduced when the managers is also owner of the firm. Hence, opening the capital to external shareholders would happen only if the corporate governance environment in the country allows for strong investor protection, especially for minority shareholders (Burkart et al., 2003). In the same vein, the change of CEO with a non-family professional is expected to increase the agency conflicts and the corresponding costs. Empirical studies show that the transfer of management to a professional CEO leads to higher use of debt financing, especially in firms with a high level of investment, and where the controlling family maintains a dominant representation on the board of directors (Amore et al., 2011). On the other hand, the transfer of management to the second generation family member leads to lower use of debt financing but hampers the growth rate of the firm (Molly et al., 2010).

In western countries, when the control over the firm is passed to the next generation, the capital is often opened to non-family members. However, family members maintain significant interest in the capital (Aguilera and Crespi-Cladera, 2012). It is estimated that the percentage interest of family voting rights after succession is even higher in the developing countries where the managerial positions in the business is also frequently maintained within the family (Aguilera and Crespi-Cladera, 2012). Aguilera and Crespi-Cladera (2012) argue that this is not necessary a drawback as long as the successor, member of the family, has acquired from the incumbent the necessary knowledge, skills and human capital which has made the family management more effective during the first generation.

Nevertheless, most of the empirical research about the impact of succession on financial structure was conducted on European or North American family firms. Very little is known about the succession planning challenges faced by FOBs in the emerging economies and the Middle East (Fahed-Sreih and Djoundourian, 2006; Ismail and Mahfodz, 2009; Chaimahawong and Sakulsriprasert, 2013).

3. Legal and cultural context of succession in the UAE

When examining the current succession planning practices in UAE family-owned businesses it is essential to consider the impact of the local cultural and legal environment. Especially because it differs in many aspect from the context where most the existent literature was developed. The social context (culture, social norms, religion…) is expected to play a crucial role in the succession of FOBs (Le Bretton-Miller et al. 2004).

The inheritance rules in the UAE are regulated by the Islamic Chari'a rules which are formally codified in the national legal system via the Civil Transactions Las (Federal Law No. 5 of 1985, as amended) and the Personal Status Law (Federal Law No. 28 of 2005) (see Chiniara and Rosa, 2009). On the other hand, the Shari'a rules and the national laws are largely influenced by and should be understood together with by the pre-Islamic Arabian tribal inheritance system. This tribe and family-centred social system still exerts significant impact on the current days' management and succession practices of the local FOBs, although a slow shift of boundaries towards a more western-style management and succession is under way (Bodolica et al., 2015).

The pre-Islamic tribal rules prohibit the transmission of the wealth to any female heir. Moreover, these rules regulate the intergenerational transfer of property as a unit (co-ownership) considering that the management of this property should be delegated to the elder son (Chiniara and Rosa, 2009). Moreover, pre-Islamic tribal rules do not allow for transfer of property outside the family, which has ensured strong family and tribal bonds (Chiniara and Rosa, 2009). The Islamic Shari'a rules, integrated in the UAE laws, have changed some of these limitations. Notably, under a forced heirship (or reserved shares) system, female heirs are allocated part of the wealth equal to half the share of the male heirs. Transfer of property to a non-family member is allowed for up to one third of the total wealth. This transfer can be applied either as a testamentary gift or as a donation during the life of the person. Nevertheless, if the beneficiary of a testamentary gift is a member of the circle of forced heirs, then it cannot be executed unless the other heirs unanimously agree with it. Moreover, the UAE law "sharply circumscribe both the rights of individual members to require that their shares be bought out and the ability of a third party to become a co-owner without the unanimous consent of the family members" (Chiniara and Rosa, 2009: 786). However, despite the restriction of this co-ownership status of the heirs, there is no requirement for the wealth to be administrated by the oldest male heir. Instead, if the heirs disagree on the future of an inherited business property, the UAE law (Civil Transaction Law, Article 304) provides for that business property to be appropriated by the heir deemed best qualified to run the business, while the value of the business is to be offset against the share of this heir in the total wealth.

In summary, the provisions of the current UAE laws and the ancestral tribal traditions pose significant limitation for local family businesses to open their capital. On the other hand, these rules somewhat force the early planning of the transition by involvement in the business of the next generation in order to train them and develop their skills in order to identify the most qualified heir. They also forces an early effort to achieve agreement between siblings, since all decisions should be taken unanimously in the co-ownership post-succession environment (irrespective of the interest share in the wealth).

4. Research design and method

Thorough understanding of the succession planning process in the UAE-based FOBs is needed in order to answer the research questions of this study. Moreover, because of the private nature of the family-owned firms, previous studies have acknowledged significant difficulties to access reliable large scale data on their succession planning and performance. Therefore, the current study will be based on primary data collected through a small number of case studies.

The FOBs in the UAE comprise a large number of small and medium-sized firms, as well as certain number of very large conglomerates and groups of companies. These businesses are present in all economic sectors: agriculture, manufacturing, construction, trade, services and financial sector. In order to be able to draw generalizable conclusions we are planning to conduct from 6 to 10 case studies, where at least two case studies will cover each size range: small companies (up to $1 million revenue), medium-sized companies (from $10 million to 100 million revenue), and large companies (more than 100 million revenue). Moreover, we are expecting to have in each size range one company in the manufacturing/construction and one company in the service/trade sector.

We have collected at this stage secondary data for two large family groups (one in the financial and one in the construction sector) and two medium-sized firms (one in the service and one in the manufacturing sector).

5. Preliminary findings

The preliminary results of the study show that the management of knowledge and capital succession in the UAE family-owned businesses is largely influenced by the local culture and traditions. Indeed, the preferred successor is often the oldest male heir, who is usually provided with high quality education and is involved in the management of the business since an early period. This facilitates the transfer of knowledge and skills. Nevertheless, despite the governmental efforts to develop the local

stock market, many FOBs prefer to maintain their capital within the boundaries of the immediate family or to seek funding in the close circle of personal relationships, instead of opening the company capital to the public and exposing the business to a greater accountability and transparency. The bank borrowing is another preferred way of funding which allows to avoid the dilution of family capital. On the other hand, many FOBs aspiring to grow internationally are opened to recruiting professional managers since the first generation, yet keeping the ownership as well as the major strategic decision within the family. This approach seems to support a heathy financial performance of the businesses examined in the study.

The impact of regional disparities in economic and social regional development process in Romania

Andra-Mădălina Pantilie, PhD Candidate, Bucharest, Romania, andra_pantilie@yahoo.com

Abstract

Regional development has become a necessity and thus a particular interest to policy makers in national and international institutions. In Romania, regional development has experienced various sizes due to the development of each region, thereby creating regional disparities. Attempts to reduce these disparities have existed since the communist period, but their outcome was one with serious consequences, the investments made in urban centers causing destabilizing migration of rural population balance. Regional disparities appearance represents one of the key issues found by the European Union Agenda 2020, amplifying concerns that aims to reduce disparities between regions regarding social exclusion or even the welfare of society.
This paper presents the need for regional development phenomenon in Romania at the economic and social level compared to the effects they have on its regional disparities. Negative externalities are presented as a case study to highlight the process of reducing disparities between development regions.

Keywords: Regional disparities, regional policy, regional development

Introduction

In order to ensure economic growth and social development to effectively use the regional and local potential of each development area there has been created the regional development policy which promotes a series of measures that should be adapted by the local and national authorities on the specific of the area. They can have two different goals depending on the desired purpose. The measures can be prevention policies or to eliminate de discrepancies by the removal of the lagging behind effects of development regions.

The main goal of regional development policy consists in reducing disparities to enhance economic and social cohesion at European Union member states.

Regional policy is manifested in the objective of reducing disparities in the distribution of industrial objectives, current workforce and infrastructure (Molle W., 1990), resources rationally. Depending on the measures, development of an area can affect also the migration of population to more prosperous areas.

The industrialization, infrastructure, and the migration phenomenon of rural population to urban areas has led to a differentiation of population distribution, economic activities and areas of regional development.

1. Disparities Analysis at European Level

European Union, seen as a conglomerate of countries is a unit with a higher level of incomes per capita, but not all regions have the same degree of regional economic and social development.

At the member states of the European Union the GDP / capita characterizing the regional disparity can be observed in Figure 1 below.

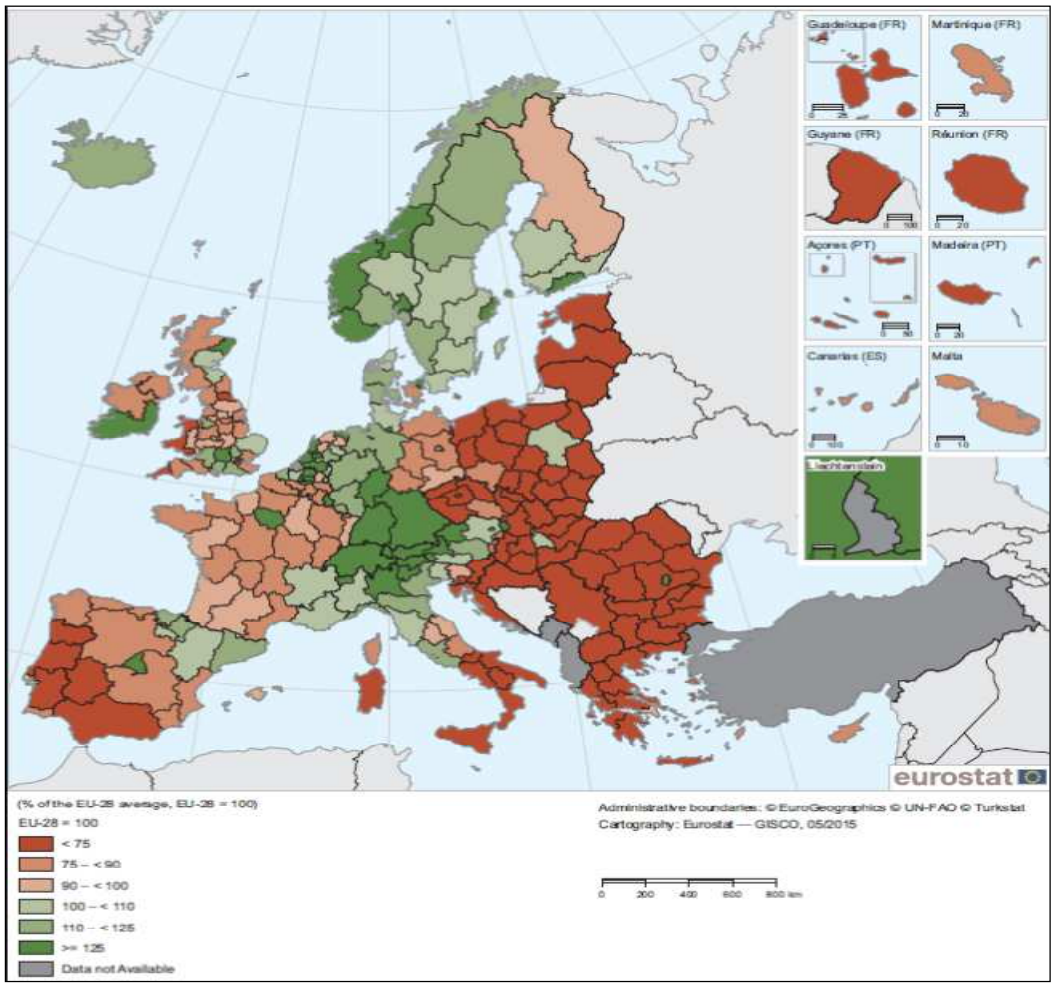

Fig. 1 Disparity index- GDP per capita, 2013 (% of average UE-28)

(Source: EUROSTAT, Statistical Atlas, Regional Yearbook 2015, Economy and Finance, Chapter 6: Economy, 6.1 Gross domestic product GDP per inhabitant, in purchasing power standard PPS, http://ec.europa.eu/eurostat/statistical-atlas/gis/viewer/?year=2015&chapter=06#)

As shown in Figure no. 1, we can see that Central and Eastern Europe show low levels of GDP / capita, Romania being part of this category.

In order to compare the development regions, or at European level or at national level, in the scientific literature are present analyzes of indicators characterizing the supply and the regional activities. These can include: from the supply side: indicators of wellbeing, concentration of infrastructure, unemployment, education level (these are prerequisites of wellfare) and regional activity indicators such as GDP per capita or the number of people experiencing the phenomenon of poverty.

Correcting the disparities at the European level can bring advantages for certain member states, but also can bring disadvantages for the already developed member countries due to the phenomenon of transfer of existing resources from the developed states to the less developed regions. The new member states is both an opportunity and a challenge for the European Union to maintain the gaps at a significantly reduced level.

2. Regional Disparities Analysis in Romania

Unlike the European Union, Romania has a GDP / capita well below the European Union average. The differences in regional development in Romania have changed over time.

Once with the introduction of the classification by the Statistical Office of the Nomenclature of Territorial Units for Statistics (NUTS), Romania has been divided into 8 development regions, type NUTS 2.

The development of the 8 regions (Table no. 1) is comparing with the European Union member states, a different one, because of the political implications, economic, and social.

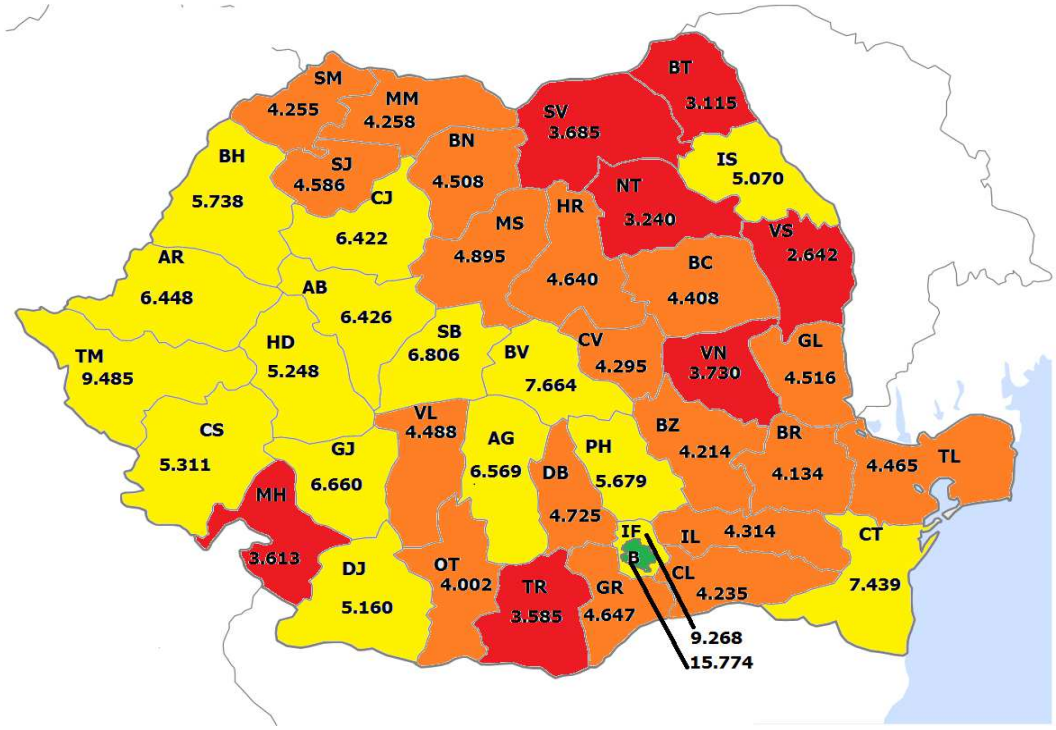

Fig. 2 GDP per capita, 2012 (in Euro)

(Source: The projection of the main territorial socio- economic indicators on 2015, National Commission of Prognosis, June 2012).

All Romanian regions have a low level of development compared to the average of European Union member states, but five of the eight are included in the list of the least developed in the European Union in terms of GDP per capita.

The rural areas show a low level of infrastructure development, the remaining population being aged and dependent on the revenues from the activities in subsistence farming, living standards being much lower than those in urban areas.

In Figure no. 2 is presented the GDP per capita (in Euro) for 2012. It can be seen as the North-East region includes counties with very low levels of GDP per capita compared to Bucharest-Ilfov development region, or the west, which are more developed on economic activities.

In a research study by Csorba (2006), the analysis of economic disparities between the regions includes a complex comparison of net average earnings per month of the population in each region.

The gaps between the developing regions in Romania increased with the transition to a market economy, the big cities and the country's capital receiving a wave of foreign direct investments and skilled labor, unlike other cities, according to studies by Zaman and Georgescu (2009) and Robson (1987). Ailenei (2012) mentions in a study that at the same time, the recent crisis that Romania passed, has left fingerprints on regional issues, emphasizing them in the next period.

Table 1 Disparity Index -Average net monthly earnings

%

Average net monthly earnings	2014	2015	2016	2017	2018
North- East	84,7	84,5	84,3	83,6	83,4
South East	86,8	86,8	86,7	86,5	86,4
Muntenia South	93,2	93,2	93,3	93,5	93,5

(Source: The projection of the main territorial socio- economic indicators on 2018, National Commission of Prognosis, December 2015).

In Table no. 1 from above, it can be observed the average net monthly earnings of Romania's population divided by the 8 development regions. Bucharest-Ilfov region is the most developed region in this aspect, and the North East the least developed. North-East region has undergone significant industrial changes, the foreign direct investments received have a small amount, and thus, the existing economic activities bringing not significant gains to the population.

These changes have significantly influenced regional social and economic structure. Thus, arose the economic and social disparities. The economic profile is characterized by the active population in the economic sectors.

Regional disparities at the european level have multiple causes, but the main causes are constituted by the ongoing expansion of the European Union and the contribution to poverty that came with each new integrated member state that accentuated the disparities.

Conclusions

European Union grants financial help to the member states with regions with reduced development posibilities, with a low degree of wellbeing, in order to support investment and job creation, to shape a sustainable economy.

In the category of less developed regions were included the regions with industrial areas from the communist period, many of them severely affected during the regionalization. Currently, the main priorities that national and international authorities should consider for reducing the negative impact of regional disparities on development at the local level are: investments to create new jobs, allocation of foreign funds (international), regional infrastructure development, using the local

knowledge resources, involving the human resources, retraining the human resources in new professions, usage of alternative resources, green energy, tourism promotion, investing in education with a focus on youth specialization in specific industries area.

The analysis of the fundamental imbalances between the regions of Romania is increasingly necessary given the increasing gaps between them.

Abstract

This study focuses on to identify surface acting and deep acting of bank tellers in commercial bank in Colombo. Study Sample size is sixty-six and random sampling technique used to select sample units and gathered data questionnaire. Data was collected through a structured questionnaire. Correlation was used to test the research hypothesis. Surface acting has not been found to be significantly associated with job satisfaction and deep acting found significantly associated with job satisfaction. So it is recommended to the bank to give more training to develop necessary skills to performing deep acting. In order to increase performing deep acting and surface acting, so as to obtain the benefits of emotional labour it is recommended to use emotional labour as selection criteria in the front office employees' selection process. Finally this study identifies that,there is significant relationship between surface acting and job satisfaction in tellers in Sri Lanka.

Keywords: Emotional labour, Surface Acting, Deep Acting and Job satisfaction

Background of the study

The Sri Lankan banking industry was changed with the introduction of private banking corporations and few foreign bank operations. Present condition of banking sector in Sri Lanka is very competitive and it is a growing industry in Sri Lankan service sector (Hemachandra, 2012) As competitive service organizations tellers in Sri Lankan banks also have to play significant role to satisfying their customers (Domingo, 2003). Customer perception about quality of service highly depends on the performance of tellers in the bank, Therefore, bank tailors require to manage his emotions on the job. Bank tailors require face-to-face or voice-to-voice contact with the public, especially with customers (Hochschild, 1983), Then those require to produce an emotional state in another person. So this type of behavior simply recognize as the "emotional labor" and it can be defined as the degree of manipulation of one's inner feelings or outward behavior to display the appropriate emotions response to display rules or occupational norms (Chu, 2002).

In present consideration about the emotional labour become increasingly popular because economies of developing countries are shifting from manufacturing to service sector. The spirit of service industry is not only "getting a job done", but also involve getting the job done with right attitude (Chu, 2002).Morris and Feldman (1996) defined emotional labor as the ''effort, planning, and control needed to express organizationally desired emotions during interpersonal transactions.'' The concept of emotional labour is mostly applicable in the service industry where there is direct interaction between the customers and the service provider. The successful service depends much on emotional labour.

A small number of researchers have examined theemotional labour of bank tailors; there has been nocritical analysis of the relationships between emotional labour and job satisfaction of bank tailors

using both quantitative and qualitative methods of inquiry. This study,therefore, addresses a substantive gap in the research literature by critically examining theserelationships.

The study of Job satisfaction is very significant because as employee spend a major time of their life at the work place. According to Luthans (2005) Job satisfaction is often described as the relationship between employees' expectation from the job and the extent to which the job fulfills the employees' expectation. It is outcome of an employee's judgment of how well the job ensures those aspects which are considered important by him or her. Herzberg (1959) identified two set of factors contributing to job satisfaction and dissatisfaction. Job satisfaction describes how comfortable an individual is with own jobs.

When we concern about bank employees job satisfaction can review various kind of literature. According to Baker (2009) found that the bank employees were as a whole satisfied with their job, supervision, people at work, and opportunities for promotion. Hanif and Yasir (2009) opined that changes in organizational variables, such as, pay scales, work environment, promotion opportunities, rewards, relation with boss and co-workers could make an effort to increase organizational commitment which, in turn, will lead to bank employees' satisfaction. Relationship with peers, subordinates, superiors were found to be capable of influencing job satisfaction. They further observed that authority to take decisions; achievements, welfare schemes and organizational policy regarding security of service, promotion, transfer and working conditions play a significant role in determine bank employees' level of job satisfaction. But Deshpande (2012) opened that interpersonal relations among the officers and clerical staff, training and development working conditions and salary have direct effect on job satisfaction of employees.

This study aims to find the relationship between emotional works and job satisfaction of bank tellers in Sri Lanka. There are less number of researches done in the banking sector regarding the emotional labor. Most researchers identify job satisfaction as an outcome of emotional labor, and some consider emotional labor as an antecedent of job satisfaction (Torland, 2013 : Grandey, 2000) . Job satisfaction is frequently point out result of emotional labor. But less considerable amount of researches has been conducted in the area of emotional labor and job satisfaction.

Researchers on emotional labor do not have permanent conclusion whether performing emotional labor increased or decreased job satisfaction (Chu, 2002). The relationship between emotional labor and job satisfaction has found both positive and negative relationship (Johnson, 2004). However relationship between managing emotions and job satisfaction has been contradictory due to different dimensions of emotional labor (Grandey, 2000).In general researchers has shown that customer service employees with high level of emotional regulation tend to be less satisfied with their jobs, but there has been some researchers that may contradict this findings (Johnson ,2004; Torland, 2013).

This study mainly focuses to examine the job satisfaction of tellers as who manage their feelings to tally with organizational norms and display some emotions for commercial purpose. They are considered the "front line" in the banking business, as they promote the financial products of the institution they work for. Thus they deal directly with customers and have to "service with a smile"(Lorga et al , 2010).

Problem Statement

Tellers are the employees who directly contact with the customers in banks. As competitive service organizations tellers in Sri Lankan banks also have to play significant role to satisfying their customers to protect and enhance their market share. Customer perception about quality of service highly depends on the performance of tellers in the bank. So it is important to examine the job satisfaction of tellers who perform emotional labour. Under this background the study research problem is **"How emotional labour of tellers in banking sector Sri Lanka effect on job satisfaction?"**

Objectives of the study

- To examine the potential effects of the two dimensions of emotional labour, surface acting and deep acting, on the job satisfaction of bank tellers in banking sector Sri Lanka..

Significance of the study

As we mention above Sri Lankan banking industry is growing day by day in their volume and the variety of service they provide. Also increasing with the number of local banks and emerges of foreign banks the competitiveness of the banking sector has increased. So it is necessary to satisfy the customer to repeat the transactions.So consideration about the emotional labour is significant.

Job satisfaction is mainly relating with job stress and turnover so this study give guideline for Human Resource (HR) managers to proper use of emotional labour. Also this study checks the effects of job satisfaction of performing emotional labour in Sri Lankan context. This study is useful to each individual to identify the effects of performing emotions to their satisfaction and to get action to job dissatisfaction through performing emotions at work.

Literature review

In past emotions were ignored in the study of work place phenomenon. But present researches highly consider that how can be the emotions impact to the employees. Emotions can be simply defined as the way people behave or the things people feel in different kind of situations. According to the past researches emotion can be defined in several ways. Erdogan (2007) said that emotions composed of individuals' positive or negative response to their social interactions.

Research has shown that positive emotions display in service sector such as smiling and showing friendliness are positively affect to the customer outcomes (Grandey, 2003). Emotions are feelings that people experience, interpret, reflect on, express and manage. They attend through social, cultural, interpersonal relationships (Chu, 2002).

Emotional labour can be defined as a "regulating some ones emotions to comply with social norm". According to the Ashforth and Humphrey (1993) emotional labor is a sense of demonstrating behaviors. In the research regarding emotional labor Morris and Feldman (1996) talked about four dimensions related to the emotional labor. Those dimensions are, Attention of emotional labor, Frequency of emotional labor, Emotional dissonance and Kind of emotional labor. While their research, researchers have discussed about various kinds of dimensions in various quantities regarding the emotional labor. Kruml and Geddes (2000) proposed dimensions of emotional labor as two factors. Those are deep acting and surface acting.When considering about the majority researchers they mainly used these two dimensions to define the emotional labour concept. In the research done about service sector employee emotions it's stated "the service person must deliberately involve his or her feelings in the situation.

Emotional labor may involve enhancing, Faking or Suppressing emotions to modify the emotional expressions. Emotions are manage in response to the display rules for the organization or job (Hochschild, 1983)

Past research has proposed that emotional labour is stressful and may result in burnout. Hochschild's emotional management perspective of emotional labor is based on the "acting" service providers perform according to his theory service is a "show" where the service provider is an "actor" the customer is the "audience" and the work setting is the stage.

Hochschild (1983) proposed that employee perform emotional behavior through three types of acting mechanism. Those are surface acting, deep acting and genuine acting.

Emotions are feelings that people experience, interpret, reflect on, express and manage" (Chu, 2002). They attend through social interaction and are influenced by social, cultural, interpersonal relationships (Chu, 2002). Social influence cause to displaying more socially accepted emotion (Chu, 2002). In work life some jobs

simply cannot be done, if emotions are not deal with first. Most service providing jobs expect for an ability to deal with people rather than with things, or in other words some jobs required more interpersonal skills and fewer mechanical skills.

Four basic emotional models can be mention according to the past researches. These models developed by Hochschild (1983), by Morris and Feldmal (1996) and by Grandey (2000).

Emotional labor is managing the emotions in-order to create physical impression and gestures that observable by anyone. (Hochschild,1983). According to his model there are two types of emotional control strategies under the rules of behavior. First one is surface acting and second one is deep acting. And also because of these strategies he mentions that the burnout, job stress, emotive dissonance and emotive efforts can be happen.

According to the Ashforth and Humphrey (1993) emotional labor is act of expressing desired emotions. He criticized about the two ways Hochschild discussed under his theory (surface acting and deep acting) does not completely capture the issue of emotional labor. Because of that Ashforth and Humphrey (1993) suggested another strategy called genuine acting.
According to this model emotional labor is planning, control and effort essential for displaying appropriate emotion during service interaction. Through Morris and Feldman's model Morris and Feldman (1996) introduce organizational and individual factors affecting emotional labor. Instead of examine surface acting and deep acting in this model they examine emotional labour with the dimensions of emotional labour process.

Emotional regulation theory was applied to emotional labor concept under the Grandey's model (1999). According to this model other three models does not completely capture the concept of emotional labor.

Employee exhibiting fake emotions that required for the specific position can be defines as a surface acting. It involve in stimulating employee emotions that are not actually felt by changing their outward appearances when exhibiting required emotions (Ashforth and Humphrey, 1993). People alter the outward expression of emotion in the service of altering their inner feelings (Hochschild, 1993).

Surface acting means the emotional dissonance exist between the inner feelings and the outer expression which persists during the interaction. This strategy sometimes can be a problematic strategy because it always different from the real feeling or the emotions.

Grandey (2000), Brotheridge and Lee (2011) and identified two sub dimensions of surface acting as faking and suppression. Surface acting can perform according to those two methods. First method is expressing false emotions and second is cover up or suppress the true feelings. The suppression condition resulted in decreased observable sign of emotions. In other word if people are capable of suppressing emotions so others cannot see how they truly feel (Grandey, 2000). When suppressing, emotional inducing stimuli of a person is lower than non-suppressing condition (Grandey, 2000). But when service provider performs surface acting through faking and they still had a state of emotional arousal (Grandey, 2000). So faking can observed and measure through body language, facial expression, mood changes or changes in the behavior.

And also one of the researches on disgust, Gross and Levension (1993) found that people were quite good in hiding emotions. However because of the surface acting people face emotive dissonance or inauthenticity.

Deep acting is a one of the dimension related with the emotional labour. According to the past researches deep acting occur when employees feeling do not fit with the existing situation. They then use their training or past experience to work up appropriate emotions. By practicing deep acting emotions are actively induced, suppressed or shaped.

According to the Hochschild (1983) deep acting active when individuals try to influence what they feel in order to become the role they are asked to display. Active deep acting refers to the case where an employee has to spend effort to regulate emotions (Hochschild, 1983).

Deep acting may be required when surface acting appears too mechanical to satisfy customer expectations of genuine interpersonal relationship.

Job satisfaction remains as one of the most researchers' popular topics within organizational behavior. Different authors have different approaches towards job satisfaction. It can be define as a negative or positive emotion resulting from appraisal of the job. Researches historically infer that emotional labourleads to job satisfaction (Hochschild, 1983). But they have not definitive conclusion about how performing emotional labour increases or decrease job satisfaction.

Weiss (2002) job satisfaction is Pleasurable or positive emotional state resulting from an appraisal of one's job or job experiences. It considers satisfaction as attitude. But some scholars had seen satisfaction as affective. Crany, Smith and Stone (1992) define job satisfaction is an affective (that is emotional) reaction to one's job resulting from the incumbent's comparison of actual outcomes with those that are desired (cited in Weiss, 2002). Job satisfaction is complex and multi-dimensional concept which can generate different things to different people (Aziri, 2011).

Job satisfaction is main factor when it comes to efficacy and effectiveness of business organization and when analyzing satisfaction, the logic is that the satisfied employee is a happy employee and in return happy employee is a successful employee (Aziri, 2011).

Many authors identified that concept of job satisfaction is closely related to what motivates and de-motivates employees (Aziri, 2011; Torland, 2013; Worrell, 2004; Lather, 2005). Hence job satisfaction is usually linked with motivation (Aziri, 2011; Torland, 2013; Worrell, 2004; Lather, 2005).But nature of this relationship is not clear. Satisfaction is not the same as motivation (Aziri, 2011).

Hochschild (1983) indicated that working to manage something as personal as emotions for commercial purposes would be inherently unsatisfying. In this case employees who are required to regulate their emotions will experience a lower level of job satisfaction.

Morris and Feldman (1997) found that an increase in emotive dissonance was negatively related to job satisfaction. When employees adapt for the surface acting their satisfaction level decreased.

Ashforth and Humphrey (1993) suggested that it may be the false feeling caused by surface acting that leads to lowered satisfaction. Therefore it is predicted that an increase in emotive dissonance will decrease job satisfaction.

When considering about relationship between deep acting and job satisfaction their seems to be less empirical support and Grandey (1999) found a negative relationship between job satisfaction and deep acting.

Whereas a considerable amount of research has been conducted within the discrete areas of emotional labour and job satisfaction, less attention has been given to exploring the relationships between these two areas (Torland, 2013).

There are less number of researches done in the banking sector regarding the emotional labour with compared to health care sector, educational sector and hospitality sector. Only Schmutte (1999), conducted a study call emotional work and its consequences on employees in the banking sector (cited in Zapf, 2002).Most researchers identify job satisfaction as an outcome of emotional labor, and some consider emotional labor as an antecedent of job satisfaction (: Grandey, 2000,Torland, 2013). Job satisfaction is frequently point out result of emotional labour. But less considerable amount of researches has been conducted in the area of emotional labour and job satisfaction.

Researchers on emotional labor do not have permanent conclusion whether performing emotional labor increased or decreased job satisfaction (Chu, 2002). The relationship between emotional labor and job satisfaction has found both positive and negative relationship (Johnson, 2004). However relationship between managing emotions and job satisfaction has been contradictory due to different dimensions of emotional labor (Grandey, 2000).

In general researchers has shown that customer service employees with high level of emotional regulation tend to be less satisfied with their jobs, but there has been some researchers that may contradict this findings (Johnson ,2004; Torland, 2013). According to Grendy (2003) job satisfaction is less in service sector and she state that job satisfaction has negative relationship with faking expression to the customers. Also Grandey (2003) hypothesis that surface acting negatively correlated with job satisfaction and those employees who acquire higher satisfaction level tend to be less act in a bat faith. Grandey (2000) suppressing true emotions was cause to lower job satisfaction and source of stress. One of the few studies has found a positive relationship between emotional labor and job satisfaction (Johnson, 2004). Typically, the researchers shows that there is negative relationship between emotional labor and job satisfaction of employees that engaged in surface acting and consequently experienced emotional dissonance (Johnson, 2004 ; Torland, 2013;Chu, 2002). While historically researchers like Hochschild (1983) and Morris and Feldman (1996) revels that emotional labor leads to job dissatisfaction (cited in Chu, 2002). Some researchers identify different personality traits as the main cause for the job dissatisfaction of emotional workers. Grandey (1999) therefore hypothesized that surface acting and deep acting both related to job satisfaction negatively(cited in Chu,2002). It means when an employee order or required to regulate their emotions in work life, they will experience job dissatisfaction regardless what type of acting techniques they involved.

Most of the previous studies conduct in international level considers about the relationship between emotional labor and job satisfaction distinguishes between deep acting and surface acting. Available data from two studies (Abraham 1998, Morris and Feldman 1997) supported that experience of emotional dissonance (which is conceptually similar to surface acting) was negatively correlated to job satisfaction (Grandey, 2000; Zapf, 2002; Chu 2002). In other words all above studies shows when employees adopt surface acting their satisfaction level is decreases. But in the other hand Morris and Feldman (1997) found a positive correlation between the frequency of emotion work and job satisfaction (cited in Zapf, 2002). According to Kruml and Geddes (2000) findings explained that surface acting may leads to feelings of job dissatisfaction (Johnson, 2004). Adelmann (1995) reported that the workers who expressed real emotions had more satisfaction than who reported faking emotions and on the other hand Kruml and Geddes (2000) again explained that employees engage in deep acting may leads to feeling of job satisfaction

But according to Hochschild (1983) there should be negative relationship between deep acting and job satisfaction, the argument she made was working to manage something as personal as emotions for organizational purpose would be inherently unsatisfied (Grandey, 2000).When considering about job satisfaction and emotional labor it is very important to consider about impact of both type of acting to the job satisfaction.

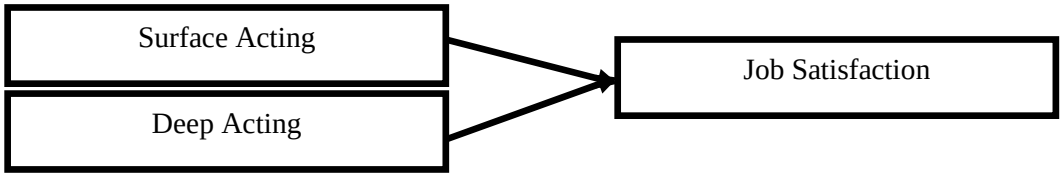
According to the Ashforth and Humphrey (1993) surface acting has associated with negative impacts as such in-authenticity of self, emotional exhaustion and frustration in emotional workers. On the other had deep acting associated with a sense of authenticity of self and reduce or completely eliminated emotional dissonance. Also some researchers show that deep acting could have positive effects on workers' job satisfaction (Ibanez-Rafuse , 2010; Sheetal 2010 cited in Torland, 2013).While surface acting predominantly had a negative effects on workers job satisfaction (Grandy ,2000 ; Hochschild,1983). Normally previous researches show that deep acting has greater impact on job satisfaction than surface acting.

Research methodology

Conceptual Framework

As stated in the above research objectives, the present study is attempt to assess the impact of emotional labour on job satisfaction of Sri Lankan bank tellers. Drawn from the literature on

emotional labour and job satisfaction, this study proposes a conceptual framework. Conceptual model developed to prove that there is relationship between emotional labour(surface acting and deep acting) and job satisfaction. In the first conceptual model emotional labour remains as independent variable, job satisfaction as dependent variable.



Independent VariableDependent variable

Figure : Conceptual Framework of the Relationships between Emotional Labour and Job Satisfaction

Operationalization of Variables

The technique of handling one's inner feelings or outward behavior to display the adequate emotions in response to display rules or occupational norms (Chu, 2002).This operational definition intimate different degree of effort employees engage to direct or manipulate their emotional state and behavior. Two types of acting styles which consider in this study require different degree of effort. It causes to change the state of satisfaction employee feel from their job. This study treats emotional labour as the main concept and surface acting and deep acting concern as two dimensions of the emotional labour.

Surface Acting refers to the management of external emotional expression and behavior without any changes in inner feelings (Kim et al, 2012). So surface acting refers to hiding ones true feelings and faking expressed emotions.Considering the above operational definition and by reviewing the literature this study identify two main dimensions of surface acting. Those are faking and suppression (Grandey, 2000; Kim et al 2012; Brotheridge and Lee 2011). This study defines faking as express of false emotions. Body language, facial expression, mood changes, emotional arousal and changers in the behavior consider as its indicators (Hochschild, 1983; Zapf, 2002; Grandey, 2000). According to this study suppression refers to hiding of the true feelings. Cover up true feelings and lower emotional inducing stimuli consider as indicators of suppression (Grandey, 2000).

Deep acting requires the modification of an employee's inner feelings to express organizationally desired emotions (Kim et al, 2012). Individuals attempt to modify how they perceive or interpret a situation to adjust their emotional response.

According to Hochschild (1983) and Torland (2013) this study identifies two dimensions in deep acting as self-prompting and method acting. Imagery (self-talking) and repeating mantra identifies as indicators in self-prompting. According to Grandey (2000) attention deployment, cognitive change and rationalization identifies as indicators of method acting.

Job satisfaction is a pleasurable or positive emotional states resulting from examine the one's job or job experience (Chu, 2002). According to the nature of the study, job satisfaction treat as multi-dimensional approach and use job satisfaction index which often referred to as the overall job satisfaction. This study measure the job satisfaction as only as perception.

Operationalization

In this research emotional labor can measure by emotional labor scales presented by Brotheredge and Lee (2003) and Kruml and Geddes (2000). Emotional labor can measure as deep acting and surface acting separately. Hackman and Oldham (1975) job satisfaction scale and Brayfield and Rothe's (1951) job satisfaction index (JSI) use to measure the dependent variable of this study. All the three variables are measured by direct questions.

Table 3.2: Operationalization of variables

Concept	Dimensions	Indicators	Measurement	Source
Surface acting	Faking	Change in the behaviour	5 point likert scale	Brotheredge and Lee (2003) and Kruml and Geddes (2000)
		Emotional arousal		
		Facial expression		
	Suppression	Emotional inducing stimuli		
		Cover up true feelings		
Deep Acting	Method Acting	Cognitive change		Brotheredge and Lee (2003) and Kruml and Geddes (2000)
		Attentional deployment		
		Rationalization		
	Self-Prompting	Self-Talking (Imagery)		
		Repeating Mantra		
Job Satisfaction	Uni dimensional			Hackman and Oldham (1975) job satisfaction scale and Brayfield and Rothe's (1951)

Sample Design and Data Collection Design

Sri Lankan banking sector have twenty five licensed banks. All the Bank tellers in Colombo are population of this study. The instruments used for assessing the two constructs were administered on a sample consisting of 66 bank tellers, of which 40 were females and 26 were males. The questionnaires were administered to 66 employees selected through clustered and random sampling method. Further sample size was calculated by using G* power.

Data Collection Design

Content of Questionnaire

The questionnaire for bank tellers was divided into three sections.

Section A : The first section, question no 1 and 2 required personal information with regards to gender and marital status them.

Section B : Questions 1 to 10 were included to determine the surface acting of bank tellers. Respondents were required to make a choice from the surface acting elements listed. And also question 11 to 20 was included to determine the deep acting of bank tellers. Response alternative of Strongly Disagree, Disagree, Moderate, Agree, Strongly Agree were applicable for all these 20 questions.

Section C : Questions 1 to 10 were included to determine job satisfaction level of bank tellers. Respondents were required to make a choice from the job satisfaction elements listed. The Likert Five point scale with Strongly Disagree, Disagree, Moderate, Agree, and Strongly Agree were applicable for all these 10 questions.

Data Analysis and Interpretation

Descriptive statistics that include frequencies and percentages were used for analysis of the data. All analyses are performed with IBM SPSS (Statistical Package for Social Science) English version 20.0.

Identifying the relationship between independent variable and the dependent variable (Hypothesis 1) . To measure of the degree of relationship among variables Pearson Product Moment Correlation Coefficient was applied in this study.

Reliability and Validity

Pilot Study

A pilot study was carried out with bank tellers. These respondents were not involved in the major study. Pilot study is important to utilize time and efficiency in conducting survey.They took 10 – 15 minutes to completion of questionnaire. However, when completing the questionnaire they investigating careful consideration and thinking. The necessary amendments were made to those questions before printing the questionnaires.

Table 2: Reliability and validity of Pilot study

	Reliability (Cronbach's Alpha)	**Validity** (Extraction Sums of Squared Loadings Cumulative %)
Surface acting	.713	87.651
Deep Acting	.732	90.979
Job Satisfaction	.849	87.467

Source: Survey Data, 2015

Findings

Correlation analysis was done to identify the relationship between surface acting and job satisfaction. According to above figures The Correlation between surface acting and job satisfaction is - 0.133 which indicates that there is insignificant negative relationship between surface acting and job satisfaction and that relationship is insignificant.

Table 3: Correlation

		Deed Acting	Surface Acting
Job Satisfaction	Pearson Correlation	.459**	-.133
	Sig. (2-tailed)	.000	.289
	N	66	66

**. Correlation is significant at the 0.01 level (2-tailed).

Source: Survey Data, 2015

There is an approximately linear relationship between deep acting and job satisfaction. So Pearson correlation can be used to analysis the strength of the relationship.

Correlation analysis was done to identify the relationship between deep acting and job satisfaction. According to above figures The Correlation between deep acting and job satisfaction is 0.459 at a significant level of 0.01 which indicates that there is a positive strong relationship between deep acting and job satisfaction and that relationship is significant.

Discussion

This study aims to identify relationship between surface acting and job satisfaction and relationship between deep acting and job satisfaction. That there is a negative relationship between surface acting and job satisfaction. According to the literature previous researches proved that there is a negative relationship between surface acting and job satisfaction (Grandey 2003: Seery and Corrigall, 2009). It is applicable to this selected organization.Then ascertain whether there is a significant relationship between deep acting and job satisfaction. Statistical analysis showed that there is a significant strong positive relationship between deep acting and job satisfaction. This research finding is in line with previous literature. (Seery & Corrigall, 2009: Johnson, 2004)

Hypothesis two established to ascertain whether gender moderates the relationship between emotional labour and job satisfaction. Multiple regression analysis used to measure the impact on relationship between emotional labour and job satisfaction. Female workers moderate the relationship and it impact affected to relationship by 19.1 %. .But male workers had not significant moderate effect on relationship.

Matching with international evidence, bank also has more female workers in the front office than male workers. Normally there is an idea that female workers perform emotions in the work place than male workers. Gender distribution in the sample is 61% female workers and 39% male workers and tally with the above idea. Hochschild (1983) mentions, in general women can manage and express feelings more than men.

Conclusion

Deep acting has positive relationship with job satisfaction and surface acting has negative relationship with job satisfaction. Comparing the surface acting and deep acting it can conclude that Sri Lankan bank tellers perform deep acting more than surface acting. Considering the combine effect of deep acting and surface acting on job satisfaction, surface acting has greater impact on job satisfaction.

Recommendations

According to descriptive statistics mean value of the emotional labour is 3.48 and that close to agree level. It implies that however important the concept of emotional labour selected bank have more than moderate consideration but not high consideration about it.

Tellers perform surface acting technique more than deep acting. So it is recommended to the bank to give more training to develop necessary skills to performing deep acting. It is special to mention that training to develop necessary skills is not enough and better to have training evaluation to measure the effectiveness of the training and include emotional labour criteria on performance evaluation process.

In order to increase performing deep acting and surface acting, so as to obtain the benefits of emotional labour it is recommended to use emotional labour as selection criteria in the front office employees' selection process. Further it is prescribe to use orientation program to convey appropriate attitude and display rules to the new employees. According to Chu (2002) Front line employees not only responsible for performing emotional labour at work place, but managers also may know how to inspired, motivate and appreciate front line workers for it. Thus this study suggested to training managers also about emotional labour.

Accessible Tourism Services on an Example of Accommodation Facilities in Prague

Ivica Linderová, College of Polytechnics Jihlava, Department of Travel and Tourism, Tolstého 16, 586 01 Jihlava, Czech Republic, ivica.linderova@vspj.cz

Petr Scholz, College of Polytechnics Jihlava, Department of Travel and Tourism, Tolstého 16, 586 01 Jihlava, Czech Republic, petr.scholz@vspj.cz

Abstract

Accessibility in tourism is one of the most discussed topics in the European Union. The number of disabled visitors increases also due to ageing population. In this context, the paper deals with accessible tourism and also it informs about requirements of disabled visitors on accommodation facilities. The paper focuses on accessible accommodation facilities in Prague and it shows possibilities for disabled visitors to travel there and enjoy their leisure time activities.

The aim of the article is to detect the readiness of the accommodation facilities to the providing services for disabled visitors in Prague. It compares a share of barrier-free accommodation facilities in Prague and other regions in the Czech Republic. We used primary and secondary research and from the methods of scientific work the analysis was used.

Keywords: Accessibility, accommodation facility, disability, universal design.

Introduction

Tourism is an important part of regional economy with numerous economic and also socio-cultural impacts. The share of Tourism on GDP in the world is 9 % (UNWTO Highlights 2015), in the Czech Republic 2.9 % (Czech Statistical Office).

In context of ageing the world population is still more important orientation on social tourism. The European Union uses for social tourism a term “tourism for all”. This term often refers to very different aspects. Sometimes, in particular in social policy context, it is used to underline the need to facilitate holidays for lower income groups, sometimes to take into account the needs of disabled visitors (Leidner, 2006).

Each person should have possibility to travel and discover beauties of Earth. According the Global Code of Ethics for Tourism (UNWTO, 2001) all tourism activities should respect the equality of men and women. They should promote human rights and, more particularly, the individual rights of the most vulnerable groups, notably children, the elderly, the handicapped, ethnic minorities and indigenous peoples (art. 2). The prospect of direct and personal access to the discovery and enjoyment of the planet’s resources constitutes a right equally open to all the world’s inhabitants. The increasingly extensive participation in national and international tourism should be regarded as one of the best possible expressions of the sustained growth of free time, and obstacles should not be placed in its way (art. 7). Really important is, that social tourism, and in particular associative tourism, which facilitates widespread access to leisure, travel and holidays, should be developed with the support of the public authorities (art. 7, Linderová, 2015b). Global Code of Ethics for Tourism is a framework of reference and a set of principles to guide all the stakeholders in the sector towards responsible and sustainable development of global tourism. One of the Code’s aims was to summarize various documents, codes and declarations (Manila Declaration, Tourism Bill of Rights, Tourist Code) of the same nature or with a similar purpose, which had been adopted by UNWTO throughout the years. On several occasions, the Code expressly mentions the right of all persons to practise tourism. Furthermore, articles 2 and 7 make

explicit reference to the rights of persons with disabilities and the need for all stakeholders to facilitate these persons' travel and tourist movements (UNWTO, 2015).

For accommodation facilities are disabled visitors an interesting target group. Disabled people are loyal customers, often returning to places that provide good accessibility. Other people may also benefit from improved accessibility, for example parents with pushchairs, people with injuries, and tourists with heavy luggage (Office for Official Publications of the European Communities, 2004).

Accessibility in accommodation facilities

Social tourism is one of the most discussed topics in the European Union nowadays. Minnaert (2014) says that social tourism is tourism that specifically encourages the participation in tourism activities of people who are economically weak or otherwise disadvantaged. Cazes (2000) sees social tourism as a complex phenomenon, which allows tourism participation for disadvantaged persons. It respects human rights as right for holiday and right for tourism, it is based on non-profit concept and it accepts social and financial situation of participants. According to Cazes, the aim of the social tourism is active use of leisure time, physical and cultural development of participants.

Various researchers have sought to highlight (McCabe, Johnson, 2013):
a) the transformative social possibilities of tourism (Higgins-Desbiolles, 2006),
b) concerns about equality of access and participation (Minnaert, Quinn, Griffen, and Stacey, 2010),
c) the individual and social benefits that can be derived from participation by disadvantaged groups (Minnaert, Maitland, and Miller, 2009).

Accessible tourism for all is a form of tourism that involves a collaborative process among stakeholders that enables people with access requirements, including mobility, vision, hearing and cognitive dimensions of access, to function independently and with equity and dignity through the delivery of universally designed tourism products, services and environments (Linderová, 2015a).

In practice, social tourism addresses four main target groups – senior citizens, young people, families with low-income and people with disabilities. Majority of these target groups have special requirements during their travel and holiday. Disabled visitors and seniors are groups with the biggest needs. They have limited mobility and they need special environment.

In the context of traveling of disabled visitors we speak about "accessible tourism for all". It is better to avoid misunderstandings.

People with disabilities are also those who are limited in the work they can do because of a longstanding health problem or a basic activity difficulty (Eurostat, 2014).

Persons with disabilities are diverse and heterogeneous, while stereotypical views of disability emphasize wheelchair users and a few other "classic" groups such as blind people and deaf people. Disability encompasses the child born with a congenital condition such as cerebral palsy or the young soldier who loses his leg to a land-mine, or the middle-aged woman with severe arthritis, or the older person with dementia, among many others. Health conditions can be visible or invisible; temporary or long term; static, episodic, or degenerating; painful or inconsequential (Linderová, 2015b).

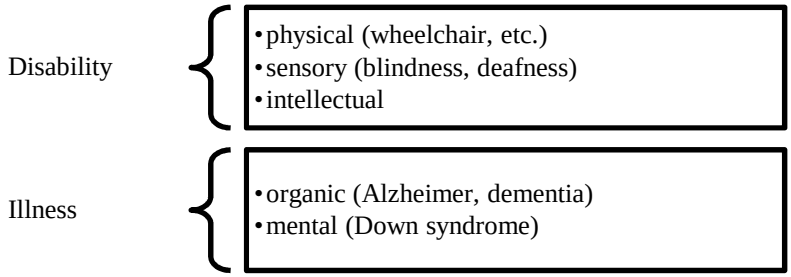

Figure 1: Disability vs. illness

Source: UNWTO, ENAT, ONCE. (2014). Manual sobre Turismo Accesible para Todos: Principios, herramientas y buenas prácticas.

According to the World Health Organization (2011) there are approximately 1 billion persons with disabilities in the world. This equates to approximately 15 % of the world population having a physical, mental or sensory disability. In addition, a rapid ageing of the population is under way. In 2009 there were more than 730 million people over age 60, equivalent to 10 % of the global population, which represented an increase of more than 20 % since 2000. By the year 2050 the number of persons over age 60 is projected to increase up to 20 % of the world population, with one-fifth of this group being over 80 years old. Due to the ageing population in the industrialized countries, the rate of disability among people with the capacity to travel is also increasing, adding to the demand for an accessible environment, transport and services – thereby adding to the market value of the accessible tourism segment (Rahman, 2005).

Accessibility is a central element of any responsible and sustainable tourism policy. It is both a human rights imperative, and an exceptional business opportunity. Above all, we must come to appreciate that accessible tourism does not only benefit persons with disabilities or special needs; it benefits us all (UNWTO, 2013). Accessibility refers to how easy it is for everybody to approach, enter and use buildings, outdoor areas and other facilities, independently, without the need for special arrangements. Providing information on accessibility and improving access benefits a wide range of people who want to travel, but who may find it difficult (Office for Official Publications of the European Communities, 2004).

The tourist service chain, however, begins with information about offers, events, destinations and the possibilities to get there. Accessible information, for example, means that the websites of tourism enterprises (including the transport sector) and destinations must be accessible also for blind and visually impaired users. To achieve better accessibility of the tourism sector would also prerequisite accessible public and private transport facilities and accessible buildings and attractions in destinations (Leidner, 2006; In Linderová, 2015a).

Persons with disabilities have special needs. So it is important to adapt for them (Linderová, 2015a) parking areas, communication tools, horizontal and vertical movements, accommodation and catering facilities, cultural activities, sport facilities, green spaces and natural environment.

It is important to adapt accommodation facilities for disabled visitors when we speak about accommodation facilities market. There should be good access to the building e.g. ramps and also special parking spaces with proper identification for vehicles of persons with reduced mobility close to the hotel. All car parks should have a minimum of one space designated for disabled drivers. Best practice is 6 % of barrier-free parking spaces, it means parking space at least 3.3 metres wide (Linderová, 2015a).

It is important to think about horizontal and vertical movements inside of the accommodation facilities. Horizontal movements mean elevators, vertical movements e.g. stairs. Stairs and other barriers e.g.

threshold should be signed. For disabled visitors are important also communication tools, e.g. the use of sign language, Braille, and augmentative and alternative way, adapted telephone, fax, internet.

Accessible accommodation should be as close as possible and on the ground floor where possible. A reasonable number of rooms in an accommodation establishment should be fully accessible to a person in a wheelchair without assistance (UNWTO, 2005). Such rooms should be designed in such a way as to allow all users to carry out the actions of moving, grasping, locating, and communicating easily and independently. This shall apply also to bathrooms and terraces if the room is so equipped (UNWTO, 2005).

A minimum transfer space for toilets, beds and seating is 750 mm. Best practice is 950 mm or wider. Height of controls for door handles, switches, lifts should be within the minimum range of 900 mm to 1,400 mm from the floor. Best practice is 850 mm to < 1,200 mm. A minimum area of circulation space for all rooms, WCs, bathrooms is 1,200 mm x 1,200 mm (or diameter 1,200 mm). Best practice is 1,800 mm x 1,800 mm (or diameter 1,800 mm). If a person with visual impairments is occupying a room alone, staff should offer to orientate the guest on the position of furniture and facilities in the accommodation (Linderová, 2015a).

To this end, the space and technical aids needed to allow any manoeuvre to be carried out easily and safely shall be taken into account. The needs of persons with impaired dexterity, blind persons, and deaf persons shall be taken into account in the design of all devices and actuators (UNWTO, 2005).
Such rooms in an establishment should be fitted with alarm systems suitable for deaf visitors and a system of communication between the reception desk and the room that is suitable for such persons (UNWTO, 2005). A suitable telephone, alarm or other means of calling for help must be available.
Corridors and passageways should be of a width to allow the passage of two wheelchairs so they are not blocked in normal traffic; otherwise, crossing zones should be provided (UNWTO, 2005).

Also hotel catering possibilities as restaurant, café, lobby bar should by adapted for disabled visitors as well as other services e.g. swimming pool, wellness centre, sauna or garden. Restaurants, cafés and bars in the hotel should provide accessible facilities which take into account ease of exterior access, furniture designed to enable their utilization by users in wheelchairs, bars at different heights, menus in Braille and with easily readable type, accessible bathrooms, etc. Such establishments should be clearly marked to make them easy to find (UNWTO, 2005).

For many people with disabilities affecting mobility, accommodation availability is critical to staying at a destination. Quite simply, if they cannot find barrier-free accommodation then they will not travel to the destination. One travel planning information issue is obtaining information about barrier-free accommodation. Many accommodation operators do not understand what accessible or barrier-free accommodation entails. In many cases, this involves accommodation operators representing their rooms as accessible or barrier-free, but people with disabilities find that the rooms are not suitable (Economic and Social Commission for Asia and the Pacific, 2003).

Barriers to accommodation occur in relation to the surrounding environment of the accommodation (location, proximity to services, public transport, parking and drop-offs), the reception, other facilities and services, and the rooms. The accommodation needs of disabled visitors on the individual, their disability and the level of their support needs (Economic and Social Commission for Asia and the Pacific, 2003).

Table 1: Barriers in accommodation facilities

Access and check-in	- lack of continuous pathways (from parking or drop off throughout all ho facilities and to the room - reception counters are too high - door widths - circulation space in corridor
Room	- rooms are inappropriately located - no steps into rooms - door widths, door stops weight, D type door handles - circulation space in rooms - uncluttered furniture layout - cupboard height and reach - access to balconies - location of cupboards, fridge, TV, clock radio, telephone, ironi equipment, etc. - availability of telephone typewriters and visual signals for deaf people - provision of orientation for people with vision impairments, includi blindness - table heights - bed heights, clearance under beds - switch and handle locations
Bathroom	- hobless roll in showers - hand held shower hose - lever taps - mirror location - hand basin positioning - space under the hand basin - need for adequate shower chair or bench - location of handrails - toilet height - positioning of the toilet (distance from the walls and front clearance)

Research design and methodology

The scientific goal of this paper is to detect the readiness of the accommodation facilities to the providing services for disabled visitors in Prague. We were interested in adapted accommodation facilities.

When searching for the possibilities for disabled visitors, we used primary and secondary (desk) research. Secondary research makes use of information previously researched for other purposes and publicly available. We focused on the documents dealing with barrier-free environment. We were interested in databases of accommodation facilities. Some information we gained from the information centres.

Primary research is a new research, carried out to answer specific issues or questions. It can involve questionnaires, surveys or interviews with individuals or small groups. Primary data were collected during the visit of accommodation facilities, which were not defined as strictly barrier-free. We used questionnaires and we contacted managers in accommodation facilities in three ways: face to face, over the phone or by e-mail. We also contacted municipality and regional office.

Results and discussion

Prague is the capital city of the Czech Republic and also the biggest city with 1,246,780 inhabitants. When speaking about economy level, Prague is the richest region with high life standard and the lowest unemployment.
Prague with its historical centre and monuments is 6th most visiting European city. In year 2000 Prague was the European Capital of Culture.

In the last years, Prague also pays attention to the barrier-free environment. Disabled visitors can there visit the Prague castle and the historical town with churches registered in UNESCO List of Cultural Heritage. It is possible to find there accessible accommodation facilities, adapted restaurants and cafés, suitable museums, galleries, sport facilities and also barrier-free transport.

In this article we were interested in accessible accommodation facilities. We have to say that number of accessible accommodation facilities in Prague increases but there are still not enough possibilities to stay for disabled visitors.

For the purpose of our research accessible accommodation facility means barrier-free access to the building and adapted room include suitable bathroom. Disabled visitors could use also accommodation facilities where is necessary staff or caregiver assistance e.g. access with one or two stairs, a close door etc.

In Prague there are located 621 accommodation facilities with 80.925 beds (2012 data). According to our analysis 114 from them are accessible, some of them with a little help of an assistant. The most full accessible accommodation facilities belong to the hotels in the First Class (46) and hotels in the Standard Class (31).

Table 2: Accessible accommodation facilities (AF) in Prague

Number AF	Accessible AF	Hotel ***	Hotel ****	Hotel ****,	Pension	Other	Share of AF
621	114	37	55	12	6	4	18,4 %

Source: Own research.

Majority of accommodation facilities has only one or two adapted rooms. To the accommodation facilities with more barrier-free rooms belong e.g. Ibis Praha Wenceslas Square***, Mövenpick Hotel Prague****, Top Hotel Praha & Congress Centre, Courtyard Marriott Prague Airport****, Hilton Prague*****, ILF***, Hotel U tří korunek***, Orea Hotel Pyramida****, Dorint Hotel Don Giovanni****.

A lack of information about accessible services is one of the biggest problems in the accommodation facilities in Prague. It is difficult to find information about adapted rooms, parking places etc. Some of accommodation facilities present accessible accommodation through web-portals, but a lot of hotels, hostels, guest houses do not inform about their accessibility. In many cases there is missing information about parking places, hotel restaurant, wellness etc. Majority of adapted accommodation facilities informs about adapted access or room, but more information are inaccessible.

Problem is also a lack of knowledge and ignorance. In many cases website informs about accessibility, but e.g. there is barrier-free access, but not barrier-free public toilet in the hotel hall, not adapted room or rooms are not usable for blind visitors etc. Also unqualified and unskilled staff is a problem. Hotel staff should to know how to behave to disabled visitor. In this area we see a big gap, which has to be reformed. We state that unqualified staff is problem not just in Prague but in other regions and towns of the Czech Republic.

Some of the hotels are also interested in blind and deaf visitors. In 23 hotels there are information boards and panels in Braille font and 26 hotels dispose of special equipment for deaf visitors e.g. light signalization for elevators or phones.

In Prague is also situated a local agency Accessible Prague for disabled visitors. They could find on its website information about barrier-free accommodation and catering facilities and also about monuments, museums, theatres and transport. The website offers a wide range of accommodation facilities, from Tourist class to Luxury Class. It states that a lot of accommodation facilities are situated in Prague historical centre near the Vltava River, which is easily accessible due to flat terrain. It is possible also to find some accommodation facilities in quiet residential locations.

Study limitations

It is significant to mention also about limitations of our research. We were interested in barrier-free accommodation facilities in Prague. The most important for us was accessibility for wheelchair users because they have the most exacting demands and requirements to the space. It is possible to clearly evaluate if accommodation facility is accessible for them or not. The accessibility for deaf visitors does not have clear parameters such as persons with physical disabilities.

In our research we used data from information offices, regional municipality and specialized websites. The problem is that not all barrier-free accommodation facilities present themselves on web-portals or through the information centres. The market also is developing, so we have to say that our results are not exhaustive and exact.

Conclusion

Disabled visitors are increasing market segment also due to ageing population. For accommodation facilities it is interesting the orientation for them, because these people are loyal customers and they often travel with personal assistant during the low season.

They consider as an important barrier-free access to the accommodation facilities, accessible room, suitable parking space, catering facilities etc. We state that in Prague there exist several possibilities to travel for disadvantaged persons.

Based on our research between years 2013 and 2015 we can state that Prague belongs to the region with highest share of barrier-free accommodation facilities. We assumed highest share in Prague but there are other region with higher share of accessible accommodation facilities e.g. Carlsbad.

Table 3: Share of barrier-free accommodation facilities in regions of the Czech Republic

Prague	Central Bohemia	South Bohem	Hradec Králov	Pardubice	Moravian-Silesian	Pilsen
18.40	10.30	9.91	1.36	2.28	7.57	8.55
Carlsbad	Ústí n Labem	Liberec	South Moravia	Vysočina	Olomouc	Zlín
20.10	22.00	22.00	8.70	11.30	11.70	16.30

Source: Own research.

We can say that the most significant failures in Prague are an unqualified staff, accommodation facilities with barrier-free access without suitable public toilets in the hotel hall, accessible rooms with bad spatial solutions, ignorance of requirements of blind and deaf visitors.

We highlight the importance of universal design and adequate approach of the staff. Universal design means the design of products, environments, programmes and services to be usable by all people, to the greatest extent possible, without the need for adaptation or specialized design (UNWTO, 2013).

Petr Scholz, College of Polytechnics Jihlava, Department of Travel and Tourism, Tolstého 16, 586 01 Jihlava, Czech Republic, petr.scholz@vspj.cz

Abstract

Accessibility in tourism is one of the most discussed topics in the European Union. The number of disabled visitors increases also due to ageing population. In this context, the paper deals with accessible tourism and also it informs about requirements of disabled visitors on accommodation facilities. The paper focuses on accessible accommodation facilities in Prague and it shows possibilities for disabled visitors to travel there and enjoy their leisure time activities.

The aim of the article is to detect the readiness of the accommodation facilities to the providing services for disabled visitors in Prague. It compares a share of barrier-free accommodation facilities in Prague and other regions in the Czech Republic. We used primary and secondary research and from the methods of scientific work the analysis was used.

Keywords: Accessibility, accommodation facility, disability, universal design.

Introduction

Tourism is an important part of regional economy with numerous economic and also socio-cultural impacts. The share of Tourism on GDP in the world is 9 % (UNWTO Highlights 2015), in the Czech Republic 2.9 % (Czech Statistical Office).

In context of ageing the world population is still more important orientation on social tourism. The European Union uses for social tourism a term “tourism for all”. This term often refers to very different aspects. Sometimes, in particular in social policy context, it is used to underline the need to facilitate holidays for lower income groups, sometimes to take into account the needs of disabled visitors (Leidner, 2006).

Each person should have possibility to travel and discover beauties of Earth. According the Global Code of Ethics for Tourism (UNWTO, 2001) all tourism activities should respect the equality of men and women. They should promote human rights and, more particularly, the individual rights of the most vulnerable groups, notably children, the elderly, the handicapped, ethnic minorities and indigenous peoples (art. 2). The prospect of direct and personal access to the discovery and enjoyment of the planet’s resources constitutes a right equally open to all the world’s inhabitants. The increasingly extensive participation in national and international tourism should be regarded as one of the best possible expressions of the sustained growth of free time, and obstacles should not be placed in its way (art. 7). Really important is, that social tourism, and in particular associative tourism, which facilitates widespread access to leisure, travel and holidays, should be developed with the support of the public authorities (art. 7, Linderová, 2015b). Global Code of Ethics for Tourism is a framework of reference and a set of principles to guide all the stakeholders in the sector towards responsible and sustainable development of global tourism. One of the Code’s aims was to summarize various documents, codes and declarations (Manila Declaration, Tourism Bill of Rights, Tourist Code) of the same nature or with a similar purpose, which had been adopted by UNWTO throughout the years. On several occasions, the Code expressly mentions the right of all persons to practise tourism. Furthermore, articles 2 and 7 make

explicit reference to the rights of persons with disabilities and the need for all stakeholders to facilitate these persons' travel and tourist movements (UNWTO, 2015).

For accommodation facilities are disabled visitors an interesting target group. Disabled people are loyal customers, often returning to places that provide good accessibility. Other people may also benefit from improved accessibility, for example parents with pushchairs, people with injuries, and tourists with heavy luggage (Office for Official Publications of the European Communities, 2004).

Accessibility in accommodation facilities

Social tourism is one of the most discussed topics in the European Union nowadays. Minnaert (2014) says that social tourism is tourism that specifically encourages the participation in tourism activities of people who are economically weak or otherwise disadvantaged. Cazes (2000) sees social tourism as a complex phenomenon, which allows tourism participation for disadvantaged persons. It respects human rights as right for holiday and right for tourism, it is based on non-profit concept and it accepts social and financial situation of participants. According to Cazes, the aim of the social tourism is active use of leisure time, physical and cultural development of participants.

Various researchers have sought to highlight (McCabe, Johnson, 2013):
a) the transformative social possibilities of tourism (Higgins-Desbiolles, 2006),
b) concerns about equality of access and participation (Minnaert, Quinn, Griffen, and Stacey, 2010),
c) the individual and social benefits that can be derived from participation by disadvantaged groups (Minnaert, Maitland, and Miller, 2009).

Accessible tourism for all is a form of tourism that involves a collaborative process among stakeholders that enables people with access requirements, including mobility, vision, hearing and cognitive dimensions of access, to function independently and with equity and dignity through the delivery of universally designed tourism products, services and environments (Linderová, 2015a).

In practice, social tourism addresses four main target groups – senior citizens, young people, families with low-income and people with disabilities. Majority of these target groups have special requirements during their travel and holiday. Disabled visitors and seniors are groups with the biggest needs. They have limited mobility and they need special environment.

In the context of traveling of disabled visitors we speak about "accessible tourism for all". It is better to avoid misunderstandings.

People with disabilities are also those who are limited in the work they can do because of a longstanding health problem or a basic activity difficulty (Eurostat, 2014).

Persons with disabilities are diverse and heterogeneous, while stereotypical views of disability emphasize wheelchair users and a few other "classic" groups such as blind people and deaf people. Disability encompasses the child born with a congenital condition such as cerebral palsy or the young soldier who loses his leg to a land-mine, or the middle-aged woman with severe arthritis, or the older person with dementia, among many others. Health conditions can be visible or invisible; temporary or long term; static, episodic, or degenerating; painful or inconsequential (Linderová, 2015b).

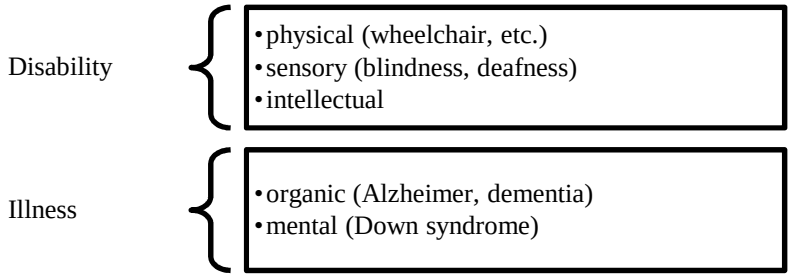

Figure 1: Disability vs. illness

Source: UNWTO, ENAT, ONCE. (2014). Manual sobre Turismo Accesible para Todos: Principios, herramientas y buenas prácticas.

According to the World Health Organization (2011) there are approximately 1 billion persons with disabilities in the world. This equates to approximately 15 % of the world population having a physical, mental or sensory disability. In addition, a rapid ageing of the population is under way. In 2009 there were more than 730 million people over age 60, equivalent to 10 % of the global population, which represented an increase of more than 20 % since 2000. By the year 2050 the number of persons over age 60 is projected to increase up to 20 % of the world population, with one-fifth of this group being over 80 years old. Due to the ageing population in the industrialized countries, the rate of disability among people with the capacity to travel is also increasing, adding to the demand for an accessible environment, transport and services – thereby adding to the market value of the accessible tourism segment (Rahman, 2005).

Accessibility is a central element of any responsible and sustainable tourism policy. It is both a human rights imperative, and an exceptional business opportunity. Above all, we must come to appreciate that accessible tourism does not only benefit persons with disabilities or special needs; it benefits us all (UNWTO, 2013). Accessibility refers to how easy it is for everybody to approach, enter and use buildings, outdoor areas and other facilities, independently, without the need for special arrangements. Providing information on accessibility and improving access benefits a wide range of people who want to travel, but who may find it difficult (Office for Official Publications of the European Communities, 2004).

The tourist service chain, however, begins with information about offers, events, destinations and the possibilities to get there. Accessible information, for example, means that the websites of tourism enterprises (including the transport sector) and destinations must be accessible also for blind and visually impaired users. To achieve better accessibility of the tourism sector would also prerequisite accessible public and private transport facilities and accessible buildings and attractions in destinations (Leidner, 2006; In Linderová, 2015a).

Persons with disabilities have special needs. So it is important to adapt for them (Linderová, 2015a) parking areas, communication tools, horizontal and vertical movements, accommodation and catering facilities, cultural activities, sport facilities, green spaces and natural environment.

It is important to adapt accommodation facilities for disabled visitors when we speak about accommodation facilities market. There should be good access to the building e.g. ramps and also special parking spaces with proper identification for vehicles of persons with reduced mobility close to the hotel. All car parks should have a minimum of one space designated for disabled drivers. Best practice is 6 % of barrier-free parking spaces, it means parking space at least 3.3 metres wide (Linderová, 2015a).

It is important to think about horizontal and vertical movements inside of the accommodation facilities. Horizontal movements mean elevators, vertical movements e.g. stairs. Stairs and other barriers e.g.

threshold should be signed. For disabled visitors are important also communication tools, e.g. the use of sign language, Braille, and augmentative and alternative way, adapted telephone, fax, internet.

Accessible accommodation should be as close as possible and on the ground floor where possible. A reasonable number of rooms in an accommodation establishment should be fully accessible to a person in a wheelchair without assistance (UNWTO, 2005). Such rooms should be designed in such a way as to allow all users to carry out the actions of moving, grasping, locating, and communicating easily and independently. This shall apply also to bathrooms and terraces if the room is so equipped (UNWTO, 2005).

A minimum transfer space for toilets, beds and seating is 750 mm. Best practice is 950 mm or wider. Height of controls for door handles, switches, lifts should be within the minimum range of 900 mm to 1,400 mm from the floor. Best practice is 850 mm to < 1,200 mm. A minimum area of circulation space for all rooms, WCs, bathrooms is 1,200 mm x 1,200 mm (or diameter 1,200 mm). Best practice is 1,800 mm x 1,800 mm (or diameter 1,800 mm). If a person with visual impairments is occupying a room alone, staff should offer to orientate the guest on the position of furniture and facilities in the accommodation (Linderová, 2015a).

To this end, the space and technical aids needed to allow any manoeuvre to be carried out easily and safely shall be taken into account. The needs of persons with impaired dexterity, blind persons, and deaf persons shall be taken into account in the design of all devices and actuators (UNWTO, 2005).
Such rooms in an establishment should be fitted with alarm systems suitable for deaf visitors and a system of communication between the reception desk and the room that is suitable for such persons (UNWTO, 2005). A suitable telephone, alarm or other means of calling for help must be available.
Corridors and passageways should be of a width to allow the passage of two wheelchairs so they are not blocked in normal traffic; otherwise, crossing zones should be provided (UNWTO, 2005).

Also hotel catering possibilities as restaurant, café, lobby bar should by adapted for disabled visitors as well as other services e.g. swimming pool, wellness centre, sauna or garden. Restaurants, cafés and bars in the hotel should provide accessible facilities which take into account ease of exterior access, furniture designed to enable their utilization by users in wheelchairs, bars at different heights, menus in Braille and with easily readable type, accessible bathrooms, etc. Such establishments should be clearly marked to make them easy to find (UNWTO, 2005).

For many people with disabilities affecting mobility, accommodation availability is critical to staying at a destination. Quite simply, if they cannot find barrier-free accommodation then they will not travel to the destination. One travel planning information issue is obtaining information about barrier-free accommodation. Many accommodation operators do not understand what accessible or barrier-free accommodation entails. In many cases, this involves accommodation operators representing their rooms as accessible or barrier-free, but people with disabilities find that the rooms are not suitable (Economic and Social Commission for Asia and the Pacific, 2003).

Barriers to accommodation occur in relation to the surrounding environment of the accommodation (location, proximity to services, public transport, parking and drop-offs), the reception, other facilities and services, and the rooms. The accommodation needs of disabled visitors on the individual, their disability and the level of their support needs (Economic and Social Commission for Asia and the Pacific, 2003).

Table 1: Barriers in accommodation facilities

Access and check-in	- lack of continuous pathways (from parking or drop off throughout all ho facilities and to the room - reception counters are too high - door widths - circulation space in corridor
Room	- rooms are inappropriately located - no steps into rooms - door widths, door stops weight, D type door handles - circulation space in rooms - uncluttered furniture layout - cupboard height and reach - access to balconies - location of cupboards, fridge, TV, clock radio, telephone, ironi equipment, etc. - availability of telephone typewriters and visual signals for deaf people - provision of orientation for people with vision impairments, includi blindness - table heights - bed heights, clearance under beds - switch and handle locations
Bathroom	- hobless roll in showers - hand held shower hose - lever taps - mirror location - hand basin positioning - space under the hand basin - need for adequate shower chair or bench - location of handrails - toilet height - positioning of the toilet (distance from the walls and front clearance)

Research design and methodology

The scientific goal of this paper is to detect the readiness of the accommodation facilities to the providing services for disabled visitors in Prague. We were interested in adapted accommodation facilities.

When searching for the possibilities for disabled visitors, we used primary and secondary (desk) research. Secondary research makes use of information previously researched for other purposes and publicly available. We focused on the documents dealing with barrier-free environment. We were interested in databases of accommodation facilities. Some information we gained from the information centres.

Primary research is a new research, carried out to answer specific issues or questions. It can involve questionnaires, surveys or interviews with individuals or small groups. Primary data were collected during the visit of accommodation facilities, which were not defined as strictly barrier-free. We used questionnaires and we contacted managers in accommodation facilities in three ways: face to face, over the phone or by e-mail. We also contacted municipality and regional office.

Results and discussion

Prague is the capital city of the Czech Republic and also the biggest city with 1,246,780 inhabitants. When speaking about economy level, Prague is the richest region with high life standard and the lowest unemployment.
Prague with its historical centre and monuments is 6th most visiting European city. In year 2000 Prague was the European Capital of Culture.

In the last years, Prague also pays attention to the barrier-free environment. Disabled visitors can there visit the Prague castle and the historical town with churches registered in UNESCO List of Cultural Heritage. It is possible to find there accessible accommodation facilities, adapted restaurants and cafés, suitable museums, galleries, sport facilities and also barrier-free transport.

In this article we were interested in accessible accommodation facilities. We have to say that number of accessible accommodation facilities in Prague increases but there are still not enough possibilities to stay for disabled visitors.

For the purpose of our research accessible accommodation facility means barrier-free access to the building and adapted room include suitable bathroom. Disabled visitors could use also accommodation facilities where is necessary staff or caregiver assistance e.g. access with one or two stairs, a close door etc.

In Prague there are located 621 accommodation facilities with 80.925 beds (2012 data). According to our analysis 114 from them are accessible, some of them with a little help of an assistant. The most full accessible accommodation facilities belong to the hotels in the First Class (46) and hotels in the Standard Class (31).

Table 2: Accessible accommodation facilities (AF) in Prague

Number AF	Accessible AF	Hotel ***	Hotel ****	Hotel ****,	Pension	Other	Share of AF
621	114	37	55	12	6	4	18,4 %

Source: Own research.

Majority of accommodation facilities has only one or two adapted rooms. To the accommodation facilities with more barrier-free rooms belong e.g. Ibis Praha Wenceslas Square***, Mövenpick Hotel Prague****, Top Hotel Praha & Congress Centre, Courtyard Marriott Prague Airport****, Hilton Prague*****, ILF***, Hotel U tří korunek***, Orea Hotel Pyramida****, Dorint Hotel Don Giovanni****.

A lack of information about accessible services is one of the biggest problems in the accommodation facilities in Prague. It is difficult to find information about adapted rooms, parking places etc. Some of accommodation facilities present accessible accommodation through web-portals, but a lot of hotels, hostels, guest houses do not inform about their accessibility. In many cases there is missing information about parking places, hotel restaurant, wellness etc. Majority of adapted accommodation facilities informs about adapted access or room, but more information are inaccessible.

Problem is also a lack of knowledge and ignorance. In many cases website informs about accessibility, but e.g. there is barrier-free access, but not barrier-free public toilet in the hotel hall, not adapted room or rooms are not usable for blind visitors etc. Also unqualified and unskilled staff is a problem. Hotel staff should to know how to behave to disabled visitor. In this area we see a big gap, which has to be reformed. We state that unqualified staff is problem not just in Prague but in other regions and towns of the Czech Republic.

Some of the hotels are also interested in blind and deaf visitors. In 23 hotels there are information boards and panels in Braille font and 26 hotels dispose of special equipment for deaf visitors e.g. light signalization for elevators or phones.

In Prague is also situated a local agency Accessible Prague for disabled visitors. They could find on its website information about barrier-free accommodation and catering facilities and also about monuments, museums, theatres and transport. The website offers a wide range of accommodation facilities, from Tourist class to Luxury Class. It states that a lot of accommodation facilities are situated in Prague historical centre near the Vltava River, which is easily accessible due to flat terrain. It is possible also to find some accommodation facilities in quiet residential locations.

Study limitations

It is significant to mention also about limitations of our research. We were interested in barrier-free accommodation facilities in Prague. The most important for us was accessibility for wheelchair users because they have the most exacting demands and requirements to the space. It is possible to clearly evaluate if accommodation facility is accessible for them or not. The accessibility for deaf visitors does not have clear parameters such as persons with physical disabilities.

In our research we used data from information offices, regional municipality and specialized websites. The problem is that not all barrier-free accommodation facilities present themselves on web-portals or through the information centres. The market also is developing, so we have to say that our results are not exhaustive and exact.

Conclusion

Disabled visitors are increasing market segment also due to ageing population. For accommodation facilities it is interesting the orientation for them, because these people are loyal customers and they often travel with personal assistant during the low season.

They consider as an important barrier-free access to the accommodation facilities, accessible room, suitable parking space, catering facilities etc. We state that in Prague there exist several possibilities to travel for disadvantaged persons.

Based on our research between years 2013 and 2015 we can state that Prague belongs to the region with highest share of barrier-free accommodation facilities. We assumed highest share in Prague but there are other region with higher share of accessible accommodation facilities e.g. Carlsbad.

Table 3: Share of barrier-free accommodation facilities in regions of the Czech Republic

Prague	Central Bohemia	South Bohem	Hradec Králov	Pardubice	Moravian-Silesian	Pilsen
18.40	10.30	9.91	1.36	2.28	7.57	8.55
Carlsbad	Ústí n Labem	Liberec	South Moravia	Vysočina	Olomouc	Zlín
20.10	22.00	22.00	8.70	11.30	11.70	16.30

Source: Own research.

We can say that the most significant failures in Prague are an unqualified staff, accommodation facilities with barrier-free access without suitable public toilets in the hotel hall, accessible rooms with bad spatial solutions, ignorance of requirements of blind and deaf visitors.

We highlight the importance of universal design and adequate approach of the staff. Universal design means the design of products, environments, programmes and services to be usable by all people, to the greatest extent possible, without the need for adaptation or specialized design (UNWTO, 2013).

Abstract

The purpose of this paper is to provide an analysis of current the planning process in Russian enterprises and to find out the main features of the planning process in correspondence with the stages of management evolution. The research was conducted using post-evolutionary and sociological analysis. By analyzing the existing works we have identified the main characteristics of planning process in connection with the management development periods. Following the features of the planning we have defined the period that corresponds to the planning process at Russian enterprises. The results of the research can be used to develop the planning system at Russian enterprises, to make it effective and to predict future problems.

Keywords: contemporary management in Russia, planning process, mission, types of planning.

Introduction

Contemporary management is definitely the most-discussed area of management. A large body of work has studied management in general and contemporary management in particular. Some have concentrated on the new management environment and organizational changes (Druker, 2008) or specific management functions (Ansoff, 2007). More recently, (Stewart, 2009) has examined new practical techniques in management or new management branches, like motivational management (Armstrong & Taylor, 2014), leadership (Miner, 2005), and organization process (Robbins & Coulter, 2012).

Contemporary management is a general term describing modern tendencies in management. This definition refers to the functions of management, management actions and the essence of the managerial work. However, the distinctive features of contemporary management remain unexplained. Contemporary management contains new procedures but little is known about them. So the division into periods in management theory is still unclear.

This paper aims to reveal the main features of the different periods in management on the basis of the analysis of the planning process in an organisation. Using the main features of the planning process as a background, the stage of management development is defined. It is our hypotheses that the shape of the planning process in the organisation can help to identify the relevant stage of management. In attempts to achieve the aim of the paper we define the following objectives:
1) to analyse the main features of the planning process in different periods in the history of management,
2) to highlight the characteristics of the planning process in contemporary enterprises,
3) to compare the features of today's enterprises with historical examples,
4) to predict problems in the development of planning processes.

The applicability of the research is determined by the new forward looking planning system that can be developed knowing the management development stage and features of the planning system of Russian companies. This new system is aimed at preventing organisational problems that are likely to emerge soon.
The main result of the study is the description of the key trends of development of the planning process in the near future. Our estimate is based on the analysis of planning processes that existed at different stages of development management as a science.

Data and Methodological Framework

1. Theoretical Background
The basic assumption of the research is that the form of the planning process can help in identifying the period in the development of management history. This hypothesis was indirectly supported by defining the main specific features of the periods in the evolution of management.
Thus, we assume that the planning process in Russian enterprises shows the attributes of the Classical management in general and Scientific management in particular.
To prove our hypothesis in this paper we have used the following methods:
1) post-evolutionary analysis,
2) sociological analysis.

2. Relevance of post-evolutionary analysis
Traditionally, the history of management consists of three periods:
1) firstly, the Classical management movement, which includes Scientific Management (Taylor, 1911; Gilbreth and Gilbreth, 1917; etc.), the General administrative approach (Fayol, 1949) and the Bureaucratic approach (Weber, 1947),
2) secondly, the Human relations movement or the Behavioral management movement, which includes the researches of E. Mayo, A. Maslow (Maslow, 1943), D. McClelland (McClelland, 1961), F. Herzberg (Herzberg, 1966), etc.,
3) thirdly, the Contemporary management movement, which comprises the process approach, the system approach, the contingency approach (Pindur, Rogers & Pan Suk Kim, 1995).

Each period has its own specific features and characteristics. We use the post evolutionary analysis to reveal the specific features of the planning process at each stage of management evaluation. We are convinced that the period in the evolution of management depends on the practice shown in management style rather than the timeline. This assumption can be shown by the following example. A currently existing enterprise can organize its management process according to the Classical management features, whereas chronologically they should belong to a contemporary organisation. By means of post-evolutionary analysis, we have proved that Russian enterprises organize the planning process by using scientific management tools and methods.

3. Relevance of sociological analysis
The research includes empirical studies of the planning process in actual enterprises. We have analyzed the planning process of one hundred enterprises which are listed as the most significant organisations of Tomsk region (Annual list of significant enterprises of Tomsk region, 2015). Table 1 shows the statistical summary of the enterprises according to their industrial sectors.

Table 1: summary statistic of the research

Research question

Examination of the specific features of the planning process we interpret in connection with the three mentioned periods in the history of management.

1. Features of the Planning Process during Classical Management Movement
Chronologically Classical management movement started from the works of Frederick W. Taylor at the beginning of the 20th century. The studies in this period were primarily focused on the process of manufacturing. The essential concerns were connected with the productivity, efficiency and costs of the manufacturing process. During the Classical management stage the main principles of manufacturing process were developed. Moreover there emerged a necessity of the new approach to management process in general and to planning, organizing motivating and controlling in particular (Pindur, Rogers & Pan Suk Kim, 1995).

To accomplish the aim of this paper the backgrounds of the planning process during the Classical management movement are listed below:
1) Plans of the enterprise are primarily focused on manufacturing and the main questions were planned machine layout and work-flow requirements; production planning; planned site location, etc. (Pollard, 1974). The instruments of the planning process were developing with orientation towards production. For example, the well-known Henry Gantt planning chart (Clark, 1923) or statistics records which were able to calculate cost and profit for each machine manufactured (Pindur, Rogers & Pan Suk Kim, 1995). Therefore it may be suggested that during the Classical management stage manufacturing process was the only one sphere of interest for managers. Thus, the planning process during the Classical management stage was centred on the manufacturing process and almost ignored all the other spheres of the organization.

2) The planning process was manager-centered. Despite Taylor's assumption that 'the primary interest of management and the worker was one and the same' (Pindur, Rogers & Pan Suk Kim, 1995), the goal and objectives setting process was a manager's responsibility. A worker was just a 'child' who needs to be organized and controlled. Hence, the manager should plan a task for the worker and the worker accomplishes the task which was planned for him.

3) Ignoring the external environment. The planning process focuses on internal elements of the organization especially on production and to a lesser extent workers. At the same time the external elements such as customers, competitors or suppliers were left out of the plans.

4) The plans of enterprises were expressed in terms of numbers and figures. Managers paid attention mostly to the quantitative results. The qualitative results were not measured.
Reviewing these key points of the planning process, we would like to highlight that the traditional view of the planning process was formulated in the classical management period. The ultimate question of an enterprise was the production and planning process was focused on the manufacturing process also.

2. Features of the Planning Process during Contemporary Management Movement
Each historical period in the evolution of management has its own specific features in the planning process. The planning process in modern management has completely new understanding in comparison with the classical management planning.
Below we list the differences between the planning process during classical and contemporary management movements:
1) Developing various types of plans. Actual enterprises pay attention to different spheres of organization and establish manufacturing plans, human resource plans, financial plans, and social plans. Moreover, all sorts of plans have equal importance for the organization.
2) The formulation and the implementation of the plan is a task for all personnel. The planning process involves not just top managers but middle, first-line managers and rank-and-file employees as well.
3) The external environment is a starting point for planning process. We believe that in contemporary management almost all the internal elements shift towards the external environment. For example,

organizational goals are developing by customers and clients; organizational charts became so flexible that they lose their structures; personnel are situated outside an organisation by outstaffing services.
4) Contingency approach to planning process.

Thus, as previously mentioned the planning process during the contemporary management movement is significantly distinct from the planning process during Classical management

3. Empirical research of planning process
To accomplish the aim of this paper we have analysed the planning process of one hundred enterprises in the Tomsk region. In the analysis we have focused on the types of planning. A large body of work has proved that the planning process includes four stages: (1) mission statement development, (2) strategic planning, (3) tactical planning, (4) operational planning.

The first step in the research was to reveal the features of the planning process at actual enterprises. We analysed the mission statement of the organisation and the types of planning: strategic, tactical and operational. The results in Table 2 show that just 27 organisations out of one hundred have a mission statement.

Table 2: mission statement statistics in connection with the industrial sector

Industrial sector	No. of organisatio	Percent of tota
Manufacturing industries	7	30.4
Transport	1	33.3
Telecommunication	1	50
Agriculture	2	6.45
Food and Beverage Service Industri	5	38.46
Textile fabrication	1	50
Commercial business	1	50
Fish processing	0	0
Building and construction work	1	12.5
Housing and public utilities	0	0
Education and science	8	80

Note: *Percent of total organisations in the industry

Educational organisations are the only ones to have well-formulated mission statements. The main mistakes in mission statements are as follows:
1) ignoring the internal environment;
2) no connection with clients and consumers;
3) no strategic goals or objectives.

After analysing the mission statements, we need to investigate the types of planning. Table 3 shows the number of organisations with a logically structured tree of objectives.

Table 3: objectives statistics in connection with industrial sector

Industry	No. of organisations wi strategic objectives	No. of organisations with tactical objective	No. of organisations wit operational objectives
Manufacturing industrie	7	7	3
Transport	1	0	0
Telecommunication	1	0	0
Agriculture	2	1	0
Food and Bevera Service Industries	3	1	0
Textile fabrication	1	0	0
Commercial business	1	0	0

Fish processing	0	0	0
Building and constructi work	1	1	0
Housing and pub utilities	0	0	0
Education and science	6	3	3

The data in Table 3 demonstrates that the organisations keenly focus on strategic goals but they almost ignore operational objectives. Manufacturing industries and educational organisations have a well-formed tree of objectives. Empirical results of the research show that the organisations usually set goals in two spheres: manufacturing and staffing.

According to the achieved results, we can conclude that the planning process in Russian enterprises shows the features of the Classical period in management history. This assumption is confirmed by the analysis of mission statements and types of planning. The research findings can be used to develop the planning process in enterprises and predict possible problems in their future development.

Conclusion

The planning process in actual Russian enterprises demonstrates the features of classical management in general and scientific management in particular. We proved that barely 27 per cent of companies have a mission statement and just manufacturing industries and educational organisations have all types of plans.

The results of this research open some directions for future studies. Future works are invited to research potential problems in the planning process. Moreover future discussion about the planning process will help to define the concept of contemporary management.

Abstract

The aim of this paper is to analyze the relationship between fiscal policy and systemic risk for European Union (EU) countries from the Central and Eastern Europe for period 2004 – 2015. First we will estimate the Granger causality degree, based on Granger causality methodology, which will be used as proxy for systemic risk. Second we will make a regression model between fiscal policy (governmental revenues and governmental expenditures) and systemic risk (Granger causality degree).
The main results of the paper pointed out that during financial crisis period the Granger causality degree increased which affected the probability for triggering the systemic risk.
Our results confirm that fiscal policy has a significant effect on systemic risk for each stock market, positive effect for Bulgaria, Hungary and Poland, and negative effect for Czech Republic, Romania and Slovakia. Similar results are obtain for the effects of systemic risk over the fiscal policy.

Keywords: Stock market, Grange causality, systemic risk, fiscal policy.

Introduction

The interdependency and linkages between fiscal policy and capital markets seem to be more and more discussed as a regulatory in financial markets. But when it comes to analyst this relationship especially in condition of financial crises it becomes more complicated.

First we know that fiscal policy has a strongly influence in economy with a large control over the macroeconomic variables especially in crisis context. But on the other hand, the monetary and fiscal policy failed to prevent the financial crisis and systemic risk. In the same time, they also failed the have control over international capital flows (Blundell-Wignall and Roulet, 2014). For this reason defining the stock market as a provider of funds in long-run for government, banks and corporations is very important to know the risk threatened by stock market, particularly in crisis period.

This represents the innovation of our paper which consist in the idea, including financial crisis, that the fiscal policy is influenced by systemic risk of stock market and the systemic risk is influenced by fiscal policy and it is necessary a continued improvement of the transmission of information between these central authorities decisions and stocks markets. Our analyses will be focused, using the methodology presented by Billio et al. (2012), in Central and Eastern European countries, in only 6 stock markets for the period 2004 – 2015. In the same time, we want to point out the evolution of interconnectedness between fiscal policy and stock markets systemic risk during financial crisis period.

The paper is organized as follows: section 2 reviews the literature regarding to the relationship between fiscal policy and systemic risk of stock market; in section 3 we present the methodology used; section 4 is reporting the main descriptive statistics of used data, while main results are presented in section 5. Finally, in the sixth section, we present the conclusions of our study.

Literature review

The questions "How fiscal policy affects the stock market?" and "How stock market influences the fiscal policy?" have been investigating in many papers. Several approaches on this issue have taken different category of macroeconomic variables in account estimating this interdependency. These researches have major importance in detecting the risk which can be occurred in stock market. Possibility of an initial shock which can affect one or more financial institutions, and the existence of a transmission channel, which facilitate the shock spreading in market is defined as "systemic risk" (Martínez-Jaramillo et al. 2010).

Due to fact that the risk level in stock market directly depends by the interconnectedness between fiscal policy and stock markets, many researchers discussed about the interdependency of macroeconomic variables with an influence in stock markets. For instance, researchers as Jansen et. al. (2008), Schabert (2003), Chatziantoniou et al. (2013), Laopodis (2009), Bekhet and Othman (2012) and Baroian (2014) demonstrated that for accelerating the stock market performance the long run relationship between stock returns and fiscal and monetary measures play an important role. On the other hand Keigo et al. (2014) demonstrated that after the investors' initiatives and the economic activity are demoralized by decrease of business opportunities, the Central Bank intervenes by increasing money supply and decreasing interest rates, which leads to economic growth.

Tavares and Valkanov (2003) provided an overview on the taxes and government spending's impact on stock market, government bonds, and corporate bonds. They found that for given public spending levels, there is no significant effect on stock and bond returns. They also concluded that an increase of tax level has a significant negatively effect which induce lower market returns. According to Alesina et al. (1999, 2002) the tax cutting will have smaller effect on investments compared with cutting the governmental expenditures. Also an increase of tax on labor market induce to lower investments.

As most studies have paid attention to the impact of fiscal policy over stock market, Agnello et al. (2015) pointed out the way how stock market affects the fiscal policy demonstrating that it has impact on fiscal variables when it is occurred an increasing of stock prices: a direct impact which induce a raising of taxes related to capital gains and fiscal revenue and an indirect impact raising householder' income, private consumption and the growth reducing interest rate. Similar results are found by Montasser et al. (2015).

Although when a policy change is accompanied with uncertainty this means a risk in stock market, which will induce to smaller interest rates and lower stock prices (Pastor and Veronesi, 2010). The stock returns become more volatile, which will induce to a cutting of investments. This risk occurred in financial market is the probability that the return of an investment to be less than investor expected return (Moretto, 2000).

Therefore, for an efficient stock market and successfully investors, as Anghel (2015) concluded for Central and Eastern European countries, are very important some technical indicators which provide specific information, as policy changes, to trade on stock markets. He also concluded that CEE investment returns depend on the market in which one investor invests and this seems to be more efficient in developed countries. For instance, in an economy which faces with a fall in GDP (developing countries), borrowing at a high interest rate (increasing the cost of external credit), would be preferred in comparing to cutting public investment and raising the taxes (Karlygash, 2013; Riascos and Vegh, 2003; Cuadra et al., 2010). A budget deficit or an external credit cause increases of interest rates, which leads to

shock in stock prices by reducing the capital investment and slowing the economic and stock market growth (Afonso and Sousa, 2012; Ardagna, 2009). This is considered as the risk of financial transactions from financial markets, which is the risk of price's decrease of a financial instrument (Abdullah and Hayworth, 1993).

Getting started from all these researches is important to highlight how the financial crisis from 2008, in United State of America, was extended by transmissions channels as a result of a higher level of interconnectedness of financial institutions and markets (Eisenberg and Noe, 2001). As Dromel (2007) results pointed out, fiscal policy parameters are able to rule out the crisis regimes circumstances. Göndör and Bresfelean (2011) demonstrated that capital markets performance is strongly influenced by reducing corporate taxes, inflation and interest rates, but in period of financial crises this seems to be more difficult by government policies. For EU countries from Central and Eastern Europe, Oanea (2015), pointed out that financial crises had a significant impact on the connectedness degree between stock markets.

Methodology – the data

Our analysis will be performed in 2 stages: in the first stage we will estimate the interconnectedness of stock markets which will be a proxy for systemic risk, and in the second stage we will apply a multiple regression in order to find the relationship between fiscal policy and the systemic risk, based on estimated proxy in stage 1.

In order to estimate the interconnectedness of stock markets, we will use the Granger causality test (Granger, 1969) through which we highlight the dependences between selected stock markets. If historical value for a series of data i can explain the evolution of a series of data j, and opposite, this means that the series i will Granger cause series j. In our analysis, the data series will be represented by the market indices returns.

For two indices returns, the linear regression will be written as follows:

$$(1) \quad r_t^i = \alpha_0^i + \sum_{k=1}^{l} \alpha_k^i \cdot r_{t-k}^i + \sum_{k=1}^{l} \beta_k^{ij} \cdot r_{t-k}^j + \varepsilon_t^i$$

$$(2) \quad r_t^j = \alpha_0^j + \sum_{k=1}^{l} \alpha_k^j \cdot r_{t-k}^j + \sum_{k=1}^{l} \beta_k^{ji} \cdot r_{t-k}^i + \varepsilon_t^j$$

where ε_t^j and ε_t^i are uncorrelated error term, $\alpha_0^i, \alpha_k^i, \beta_k^{ij}, \alpha_0^j, \alpha_k^j, \beta_k^{ji}$ are the coefficients of linear regression, t – time indicator, and l – is the number of selected lag for applying the test.

If β_k^{ji} is different by 0, the data series i Granger cause data series j and similar if β_k^{ij} is different by 0, the data series j Granger cause data series i. In case that, both β_k^{ji} and β_k^{ij} are different by 0, then we have a bilateral causality relation.

Further we will define the following Ganger causality indicator based on formula (3):

$$(3) \quad I_{(i \to j)} = \begin{cases} 1, & \text{if series } i \text{ Granger cause series } j \\ 0, & \text{if there is no influence} \end{cases}$$

Special situation $I_{(i \to i)}$ and $I_{(j \to j)}$ will be equal to 0.

Final aim of the first stage is to estimate the Granger Causality Degree (GCD) proposed by Billio et al. (2012), which shows the percentage of significant Granger causality relationships from the total possible number for each country. In our case the total possible number of relationships for each country is 10, because each country can affect the other five, but in the same time the other five countries can affect the analyzed country. GCD is computed based on relation (4):

$$(4)\quad GCD_t^y = \frac{\sum_{i=1}^{N}\sum_{j=y} I_{(i\to j)} + \sum_{i=y}\sum_{j=1}^{N} I_{(i\to j)}}{No_{\max}^y} = \frac{1}{10}\left(\sum_{i=1}^{N}\sum_{j=y} I_{(i\to j)} + \sum_{i=y}\sum_{j=1}^{N} I_{(i\to j)}\right)$$

In the second stage of the analysis, we will test the link between fiscal policy and systemic risk of the stock markets. For fiscal policy we will use two proxies: governmental expenditures and governmental revenues. Also, because our sample includes the crisis period, we will extend the model by introducing a dummy variable which will represent the financial crisis period.
First model shows the influence of fiscal policy on systemic risk of selected countries and it is given by equation (5) while second model given by equation (6), emphasizes the systemic risk influence to fiscal policy:

$$(5)\quad GCD_t^y = \alpha_0^y + \alpha_1^y \cdot FisPol_t^y + \alpha_2^y \cdot CRISIS_t^y + \alpha_3^y \cdot R_t^y + \alpha_4^y \cdot GDP_t^y + \varepsilon_t^y$$

$$(6)\quad FisPol_t^y = \beta_o^y + \beta_1^y \cdot GCD_t^y + \beta_2^y \cdot CRISIS_t^y + \beta_3^y \cdot R_t^y + \beta_4^y \cdot GDP_t^y + \omega_t^y$$

where the GCD_t^y is the Granger Causality Degree for country *y* for time *t*; R_t^y is the indices returns for country *y* and time *t*; GDP_t^y - GDP growth rate for country *y* and time *t*; $CRISIS_t^y$ - represent the effect of financial crisis period; $FisPol_t^y$ - fiscal policy represented by government revenue or expenditure for time *t* and country *y* (calculated as percentage from GDP); $\alpha_0^y, \alpha_1^y, \alpha_2^y, \alpha_3^y, \alpha_4^y, \beta_0^y, \beta_1^y, \beta_2^y, \beta_3^y, \beta_4^y$ – represent the model's parameters for country *y* and $\varepsilon_t^y, \omega_t^y$, – error terms of the model for country *y*.

Model estimation using last square method (LS) will be done in two steps, by using both government revenue and government expenditure as proxies for fiscal policy, in order to prevent the multicollinearity in the regression model.

Data and descriptive statistics

Sample used in the analysis is formed by daily data for period 2004 – 2015, for the most important six stock market indices from EU countries located in Central and Eastern Europe, as follows: Bulgaria – SOFIX, Czech Republic – PX, Hungary – BUX, Poland – WIG, Romania – BET and Slovakia – SAX.
Indices values were denominated in EURO based on official exchange rates from European Central Bank.

The quarter data for government revenue (% of GDP), governmental expenditure (% of GDP) and GDP growth has been obtained from Eurostat database, and based on linear interpolation were transformed in daily data.

Going on, in table 1 we present the main descriptive statistics for the analyzed indicators.

Table 1. Descriptive statistics for analyzed variables

Variables	Mean	Median	Max	Min	Std. Dev.	Skewness	Kurtosis

Based on the information from table 1, we can see that the most profitable stock market is Poland and Hungary, which record a daily performance of 0.03%. In the same time, the lowest performance is obtained in Bulgaria case, for which the daily return of stock index is -0.01%. Going further, for the governmental revenues we are able to see that the highest value is recorded by Hungary (45.29% of GDP), while the lowest one is obtained in Romania (33.58% of GDP). For the governmental expenditures we have the same distribution, so the maximum value is 49.60% for Hungary, while the lowest one is 36.92% for Bulgaria and 37.12% for Romania.

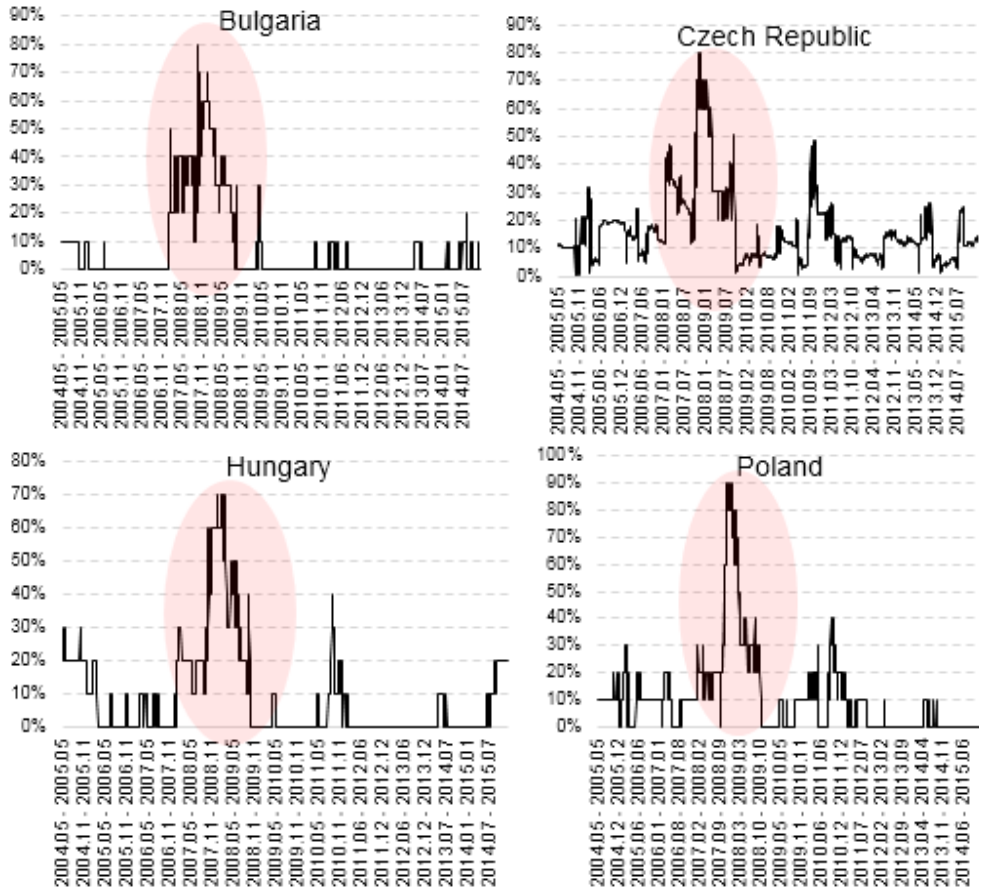
Based on calculated variable, Grange causality degree, we can see that the highest value is recorded for Czech Republic (13.84%) followed very close by Romania (12.64%), while the lowest value is recorded for Bulgaria (6.89%) and Slovakia (5.85%). We will use this variable as a proxy for systemic risk, so as higher is Granger causality degree, the interconnectedness between stock markets is stronger, and the probability for triggering a systemic risk is bigger.

Results

In order to estimate the Grange causality degree for each stock market we apply the Granger causality method based on rolling window approach such that we estimate the test, for windows of 250 observations each, which means one trading year. We are taking into account only Granger causality significant at 1% level.

It is clearly obvious the fact that during financial crisis period the Granger causality degree recorded a significant increase being more than double compared with the previous period. The highest value is recorded for Poland (over 80%), being the most interconnected stock market, so the probability for triggering systemic risk is big, because the probability of triggering systemic risk is directly related with the value of this indicator, such that as higher is Granger causality degree, as higher is probability of systemic risk occurred.

Going further, we are able to see that for the last 2 – 3 years the interconnectedness between stock markets decreased a lot, and the average value for GCD for each country is less than 20%.
In the second stage of our analysis we want to see the relationships between fiscal policy and systemic risk, using as proxy for fiscal policy the governmental expenditures and revenues, as percentage of GDP and as proxy for systemic risk the Granger causality degree estimated in first stage of analysis.



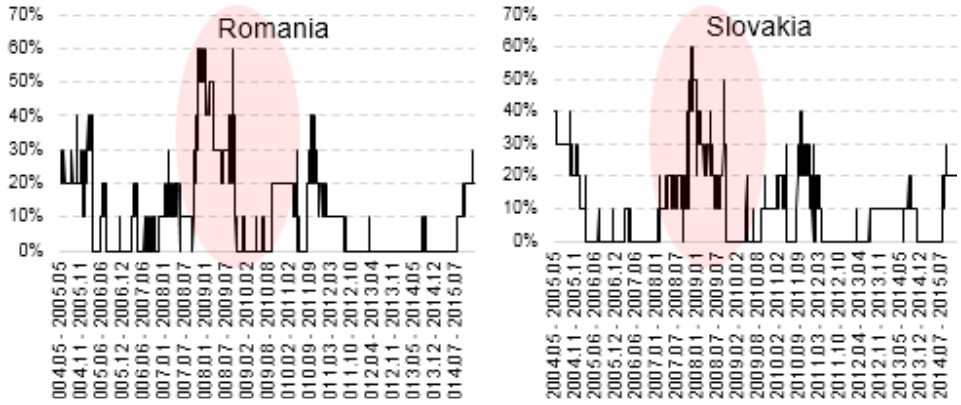


Fig 1. Granger causality degree (significant at 1% level)

First we will try to see if the fiscal policy, GDP growth, stock market return and financial crisis affects the systemic risk of each stock market. The model estimation for each country is presented in table 2.

Table 2: Effect of fiscal policy on systemic risk – regression model estimation

*,**,*** - Indicates significant at the 0.1 level, 0.05 level and 0.01 level

Based on the results, we can see that the fiscal policy has a significant effect on systemic risk for each stock market. The differences appears regarding the sign of the influence. We are able to see that the

fiscal policy affects positively the systemic risk for Bulgaria, Hungary and Poland, while for the other 3 countries, Czech Republic, Romania and Slovakia, the influence is negative.

In the same time, as we expected, the financial crisis has a significant positive effect for all countries, which means that during financial crisis the systemic risk had increased. This results confirm the Granger causality degree estimated in stage one and presented in figure 1.

Going further we can see that the economic growth (GDP growth rate) affect negatively the systemic risk. So if the country has a strong economic power, the systemic risk will not have significant effect on stock market.

Second we estimated the impact of systemic risk, GDP growth, stock market return and financial crisis on fiscal policy of each country. The model estimation by country is presented in table 3.

Table 3: Effect of systemic risk on fiscal policy – regression model estimation

Fiscal policy – dependent variable	Country	Constant	Systemic risk	Crisis	Index	GDP growth	R-squared

[a] – (standard errors in parentheses)
*,**,*** - Indicates significant at the 0.1 level, 0.05 level and 0.01 level

Similar to previous results, we obtain that systemic risk has a significant effect on fiscal policy for each country. The differences appears when we consider the sign of the influence. We are able to see that the systemic risk affects positively the fiscal policy for Bulgaria, Hungary and Poland, while for the other 3 countries, Czech Republic, Romania and Slovakia, the influence is negative.

In the same time, as we expected, the financial crisis has a significant and positive effect over the governmental expenditures and a negative one on governmental revenues.

Also we can see that economic growth (GDP growth rate) has similar affect to previous results

Conclusions

The aim of this paper was to analyze the relationship between systemic risk of the main stock markets from the EU countries from the Central and Eastern Europe for period 2004 – 2015, and fiscal policy.
Over the analyzed period, we can see that the most profitable stock market is Poland and Hungary, which record a daily performance of 0.03%, while the stock market from Bulgaria is not performant – the daily return of stock index is -0.01%.

Our analyze confirms that the stock markets are vulnerable during financial crisis period, when the Granger causality degree is higher and systemic risk occurrence is increasing. Based on calculated Grange causality degree, the most interconnected stock market is the one from Czech Republic (13.84%) followed very close by Romania (12.64%), while the less interconnected stock market is the one from Bulgaria (6.89%) and Slovakia (5.85%).

The fiscal policy has a significant effect on systemic risk for each stock market, positive effect for Bulgaria, Hungary and Poland, and negative effect for Czech Republic, Romania and Slovakia. Similar results are obtain for the effects of systemic risk over the fiscal policy.

In the same time financial crisis has a significant positive effect for all countries over systemic risk. Moreover the effect of crisis over the governmental expenditure is positive, while over the governmental revenues is negative.

Further research can take into account to extend number of countries taken in analysis, identifying the impact of stock market systemic risk over the other markets and the interconnectivity between fiscal policy and systemic risk in a large number of different regions.

Abstract

The aim of the paper is to present the conceptual framework related to the construction of an early warning system that will be used in later operationalisation of the implementation measures. The paper presents selected issues concerning the project knowledge management, early warning systems, the concept of weak signals, as well as risk analysis. There is a need for their synthesis in order to efficiently recognize the potential opportunities and threats in the project life cycle. The proposed model of an early warning system based on knowledge integrates the elements of the theory and solutions unprecedented in project management. The basic idea is that the system should provide information concerning situations that threaten the implementation of projects, about dangerous phenomena and processes as well as the probability of their development. The system should allow rapid and flexible response to the forthcoming events, which in turn should translate into faster adaptation to adverse situations arising during the implementation of the project. It is proposed to assign prediction of threats with the identification of project risks in the form of a rule-based expert system. The capture of potential opportunities constitutes at this stage of the study only an added value and does not prejudge the functionality of the proposed system.

Keywords: weak signals, early warning system, project management, knowledge management, uncertainty, risks and opportunities.

Introduction

The challenge for today's businesses is speed of the operation. It results, among others, from high volatility environment and functioning conditions for the enterprises. Volatility is induced by the uncertainty of the business environment and the need to respond quickly to unpredictable opportunities and threats. The crisis in recent years, which effects are still felt in a lot of economies, caused that enterprises with even greater attention began to approach the problems of discontinuity, change, environment turbulence and uncertainty. It should be additionally emphasized that the technology development, including information and technical technology as well as the intensifying processes of globalization mean that instability in one part of the world, or in one industry branch, can easily and quickly move to the next areas of the world economy or other industry, adding the same negative effects. In addition, what derives from the economic practice, the effect of the so-called "black swan" is increasingly recognized, which is particularly noticeable in economic sectors with a higher degree of risk, e.g. in the financial sector (Taleb, 2008). The effect of "black swan" is an event, which is difficult to predict, which differs significantly from the average, in turn, has a very negative impact on the given phenomenon. The consequences of the effect can be easily explained after its occurrence. In practice, the events of this type are changing radically the conditions of enterprises' functioning in the market, leading often to the enterprise's bankruptcy, which until now have been reaching certain profits. An example of the "black swan" effect, is among others, the crisis of 2008/2009, or the bankruptcy of Internet enterprises in 2001. The consequences of the phenomena described above are particularly dangerous for the smooth and effective functioning of the enterprise. In business practice, there may be a "domino effect", which occurs as a result of a string of more or less controlled, events that may adversely affect the enterprise and subsequent operators. Effective risks prevention is associated with the problem of observability and predictability. This applies to both observation and prediction of uncontrollable factors as well as monitoring of the relationship between the intended and actual effects of action.

In this context, to elaborate an early warning systems for the occurrence of such type of negative events gains a significant importance. The concept of the early warning systems is an instrument of strategic management (Nikander, Eleoranta, 2001; El Akrouchi, Benbrahim, Kassou, 2015). Until now, this concept has referred exclusively to business management. In the few works (Nikander, Eloranta, 2001; Nikander, 2002; Vanhoucke, 2011; Kappelman, McKemann, Zhang, 2006; Haji-Kazemi, Andersen, 2013, 2014) dealing with project management, one can find a reference to the concept of Ansoff's weak signals (1975). This paper aims to describe and link the concept of weak signals and early warning systems in project management. Posted system model of this type can serve as a tool to identify potential opportunities and threats in the project life cycle. The success of the project accomplishment may depend on, among other things, the ability to respond in advance to potential opportunities and threats, avoiding strategic surprises that disorganize the implementation of the project. The accomplishment of particular projects, completed successfully, influence the improvement of the enterprise's competitiveness, as well as local and regional development. This tool can be a valuable source of knowledge for project managers in decision-making processes.

Project management in the conditions of uncertainty and risk

The economic practice shows that an increasing number of tasks in enterprises are a non-routine activities, often of a significant degree of innovation. These tasks bear features of projects. The project is a set of activities undertaken by the organization as a new, unique and often innovative challenge, so far not have been taken, in order to meet specific objectives. As a result of the project accomplishment, a unique product or service is created. The project has a specific start and end date, a defined range and planned budget (PMI, 2013). The aim of the project is to achieve expected results, aimed towards satisfying customer-mandator's needs, primarily by achieving the following parameters at an assumed level (Kerzner, 2013a): fulfilment of requirements, implementation costs, accomplishment time. The enterprises may at the same time carry out more than one project. In this context, the importance of project management becomes a problem in terms of limited access to resources is significant (Pisz, Banaszak, 2008).

The process of planning, organizing, directing, controlling the corporate resources for the sake of the implementation of a relatively short-term goals that have been set in order to achieve the specific goals of the project is the essence of project management (Kerzner, 2013b). One of the undoubtedly essential features of project management is the growing uncertainty. Project management accompany the unexpected tangles of events, both positive and negative, that are difficult to predict. As follows from the practice of business and published researches, a large part of the projects fail - time transgression, the cost of the project, or part-range accomplishment. Planning and implementation of projects is subject to a degree of risk. Two concepts of risk are mentioned: neutral and negative. According to the concept of the neutral risk it is understood as a threat and an opportunity, which means the possibility to obtain a result different from expected. In turn, the negative concept defines risk as a threat, which means the possibility not to achieve the desired effect (Hillson, 2002). The risk in the project appears especially because the project is an innovative , unique, one-off action and it is not easy to predict the direction of its implementation in uncertain situations. In each of the elements of the closer or further environment projects may be prone to unexpected changes which may affect the project, directly or indirectly, to a greater or lesser extent. The level of risk is growing exponentially depending on the planning horizon. The risk of the project is the greater, the greater the uncertainty about the results of the projects, the danger of failure of assumptions, expectations and formulated goals. An important role is also taken by the probability, extent and manner of the internal as well as external influences on the project, which are potential hazards for the specific project.

Uncertainty and risk of functioning is a consequence of highly turbulent environment. Project management process requires the use of a variety of information about the environment in the project life cycle, to generate new knowledge (project knowledge), raising the level of organizational learning and making decisions accompanying this process. In practice, this implies the need for the kind of information that allows the anticipation of the environment's future states. For this purpose, it is essential

to develop early warning systems, which are a special kind of information systems dedicated to decision-makers, including project managers.

The concept of weak signals in anticipation of temporary changes

The concept of weak signals was established in the 70s of the twentieth century. The pioneer of the analysis was a Russian mathematician and economist Harry Igor Ansoff (1975; 1980; 1984). In the following decades, the concept has been developed, among others, in the work (Coffman, 1997; Uskali, 2005; Ilmola, Kuusi, 2006; Saul, 2006; Hiltunen, 2008; Glassey, 2009; Rossel, 2009). Over the years the literature formulated different definitions of weak signals. Ansoff (1975) defines it as vague early signs of impending significant events, but Coffman (1997) as any information that is difficult to receive or recognize because of noise. Weak signals are slightly noticeable trends that could, in the future, have a major impact on competitive advantage. These kind of signals are early, vague signs of inevitably impending major events, changes that will affect, in a strictly indefinite future, the trajectory of the system development. Weak signals are referred to as something new, surprising, uncertain, irrational, unreliable, difficult to track, far distant in time from the time in which the events, ideas are already mature and dominant (Magruk, 2010).

A weak signal is the message carrier of specified object, process or project parameters. This knowledge, along with time anticipation, allows to identify possible changes in the future. In many cases, weak signals should be clarified, as it depends on the recipient on whether it is possible to read it. The rule is that if the signal is stronger, the information is more clear and complete. It is assumed that the actions taken on the basis of their decisions are more apt. The weakness of the signals has its own internal and external sources (Hiltunen, 2008). Hiltunen, as external weakness of the signal, assumed relatively weak connections between the preceding events and the following events. Events occurring at the moment may, but not necessarily must, precede future discontinuity, as with time, more change confirming signals will appear (these symptoms should be monitored). If the organization does not realise the pre-existing relationship between the preceding and the following events caused by the lack of information or wrong interpretation, It is the sign of the internal weakness of the signal.

A significant problem using the concept of weak signals in the change time anticipation, are errors in the recognition and interpretation. It should be emphasized that the probability of errors of incorrect signals identification is due to rise thanks to the specific characteristics of this type of the signals (see Fig. 1), it means the ambiguity and fragmentation (Knowles, Grove, Keck, 1994). It depends of the sensitivity of the observer whether the received signal is classified as a symptom or noise. In a situation where the noise is treated as a symptom of change, a “mistake” is of little importance. In the process of further interpretation and elimination, the information may be clarified, and the decision about taking action can be changed. Much more serious implications is caused by a mistake, resulting from the treatment of the signal as noise. The result may be the omission of information and exposure to the significant threat posed by surprise. An important property of the weak signals concept is to determine the threshold of response to false alarms. On the one hand, efforts should be made to minimize false alarms, on the other hand we must remember about the efficiency of symptoms detection. If the threshold is lowered it will limit ignored signals. In this case, a number of false alerts will increase, which can lead to interruption of the production process or the accomplishment of the project processes. On the contrary, the reaction will take place at a higher signal strength, there will be less false alerts, but it will result in more omissions. It is a dilemma which is difficult to resolve. The decision is up to the observer whether to bear the cost of false alarms, or allow the organization to be surprised.

The success of the project may depend on, among other things, the ability to respond in advance to potential opportunities and threats, avoiding strategic surprises, that disorganise the project implementation. The strategic surprises may take place in the project, when one fails to recognize the so-called “strategic inflection point” (Cai-Hillon, Hillon, Boje, 2012). The aim should be to capture weak signals that precede strategic surprise. The concept of weak signals is applicable wherever there is ambiguity of the links between the present and the future.

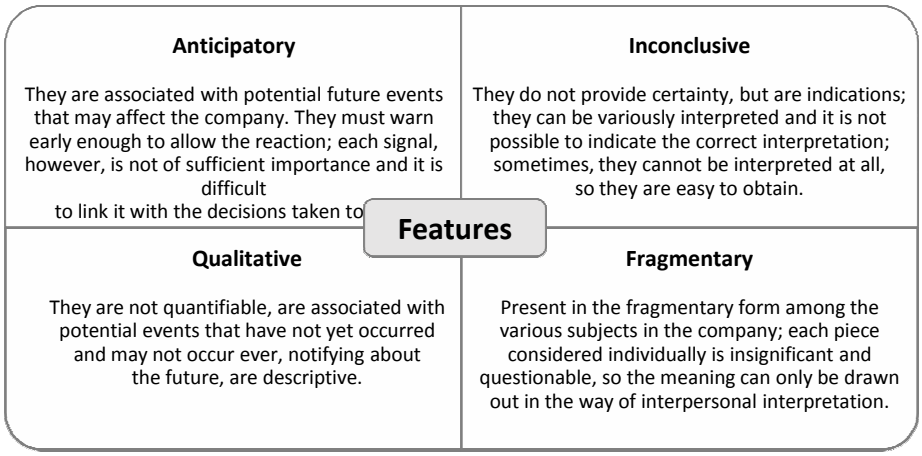

Fig. 1. Basic features of weak signals

Source: elaboration based on (Nalepka, Bąk, 2012)

Linking the concept of weak signals and the project knowledge management

Currently, the most important strategic resource of the enterprise becomes the knowledge, consciously obtained, produced and disseminated by means of different methods, focused on the elaboration of the appropriate employees' behaviour and the development of information and communication technology (ICT), supporting these processes. Prosperous economies of a high level of technological development, create information societies, where information management, its quality, the flow speed rate are essential factors of competitiveness in industry and services, and the degree of development requires the use of new techniques for collecting, processing, transmission and use of information.

Knowledge in the organization's activities, including the implementation of projects for many years has been an area of researchers' interest who have confirmed its essential importance for building enterprises' sustainable competitive advantages. In project management, this subject takes on a new character, as it is transferred to the field of dynamic, time-limited, temporary and collectively accomplished projects. From the nature of the projects a special relationship derives, that is not explicitly described by the standards of project management, however, it is emphasized in the background. The significance of the decision and its impact on the project is generally inversely proportional to the knowledge about the project both at the project beginning and at its final stage. The existence of this relationship has an impact on the entire construction methods and project management processes beginning with the base lining, throughout progressive planning, staging, risk management to post project reports. Projects are characterized by a high level of uncertainty at the beginning of implementation. It results from the key features of each project - providing something innovative, so burdened with a large portion of ignorance. Thus, the project is being implemented progressively by the method of successive approximations. As with so many unknowns, any initial estimates and assumptions may prove to be incorrect, e.g. the task will not one day but a week, the product will cost twice more, the new technology will be much more productive than expected, a new supplier proves to be unreliable.

The carried out research (Wyrozębski, 2014) shows that the projects characteristics distinguishing them from the enterprise's routine activities, makes the project knowledge management so much more difficult than knowledge management in traditional organizations, but also has the potential to bring greater benefits. Two key features of projects assigned primarily with obstacles in the project knowledge management is the time limitation of the of the project and its disposable character. Disposability derives not only from the uniqueness of the objectives pursued through projects, but also for other reasons. Projects are actions of short-term oriented cooperation of interdisciplinary teams which are made up by the organization's internal and/or external experts and thus constitute a unique employees' systems (project teams). Hence definiteness of the projects three main parameters - time, costs and resources, could constitute a serious limitation for the project knowledge management.

Acquisition, collection and processing of the knowledge carried by weak signals is necessary for effective projects implementation, especially those with a high level of innovation. Interpretation of the information, carried by the weak signals, implies making certain decisions that are necessary for carrying out the projects, e.g. the introduction of additional resources units, due to the threat of keeping the project's deadline, a contract with a new supplier because of the imminent risk of poor product quality. It becomes necessary to take specific measures to protect the enterprise from the consequences of the project changes. Reception of weak signals and the use of the information deriving from their interpretation in the processes of knowledge creation, avoid surprises of strategic nature, most of which are predictable astonishments (see Bazerman, Watkins, 2004), as they are indicated before. The integration of knowledge management theory with the concept of weak signals using the ICT tools constitutes the starting point for the construction of a dedicated early warning system of implemented projects.

Early warning system based on the knowledge

Early warning systems are a specific type of information systems of a considered enterprise whose main objective is the steer the implemented processes in the enterprise in the direction of perception and interpretation of weak signals (Nalepka, Bąk, 2012). The main task of the early warning systems is a constant search for the impulse to change the enterprise, both occurring in its environment, as well as inside. Popularized in management science the term "early warning systems" may suggest that the aim is primarily to inform about the risks, while the early warning systems should also allow to capture information about potential opportunities. A broader approach, although in practice rarely used, in accordance with the challenges of the organization's modern approach, especially referring to the postulate of G. Hamel and C. Prahalad, who stated that the purpose of competition among enterprises is no longer to increase market share, but to compete for the participation in opportunities (Hamel, Prahalad, 1999).

In the literature of the subject, there are three categories of the early warning systems around which theoretical considerations and practical tests focus. The first category focuses on large economic systems, such as the economy of the country, region or the world economy. These systems are largely based on the principle of inertia and the change continuity. The second category includes the bankruptcy related early warning systems of economic entities – enterprises, banks or other organizations. In turn, the third category includes the early warning systems for enterprises. Systems of this type were characterized in the eighties of the twentieth century by W. Klausmann, discerning its three generations (Hunek, 1989):

- systems of the first generation, it means the operating early warning systems, focused on the periodic comparing of the actual state (beheld) with their planned or expected values,
- second-generation systems, means the indicative early warning systems, based on observations of an indicators set with a high predictive value and comparing them with the reference values,
- third generation systems associated with the concept of weak signals by Ansoff. Weak signals derive from a distant environment of the enterprise, from the initial links of the cause and effect chain, and may inform about the approach of strategic changes.

A significant idea that could be the beginning of the development of a new, fourth generation of the early warning systems, is to use an in-depth analysis of the cause-and-effect dependences, by the use of e.g. methods of steering and systems theory. The essence of the weak signals concept is a warning well in advance of the risks emerging in the enterprise's distant environment. However, for modern enterprises a greater threat may be numerous, complex interactions and interactions occurring between the enterprise and its close surroundings. In this type of relationship, dangers are created, often provoked by its own activities, which cannot be predicted well in advance (Zoleński, 2010).

Regardless of the detailed solutions, each early warning system should enable the acquisition, analysis and transmission of warning signals, being a particular type of the organization's information system. The basic functions of the early warning systems are presented in Fig. 2.

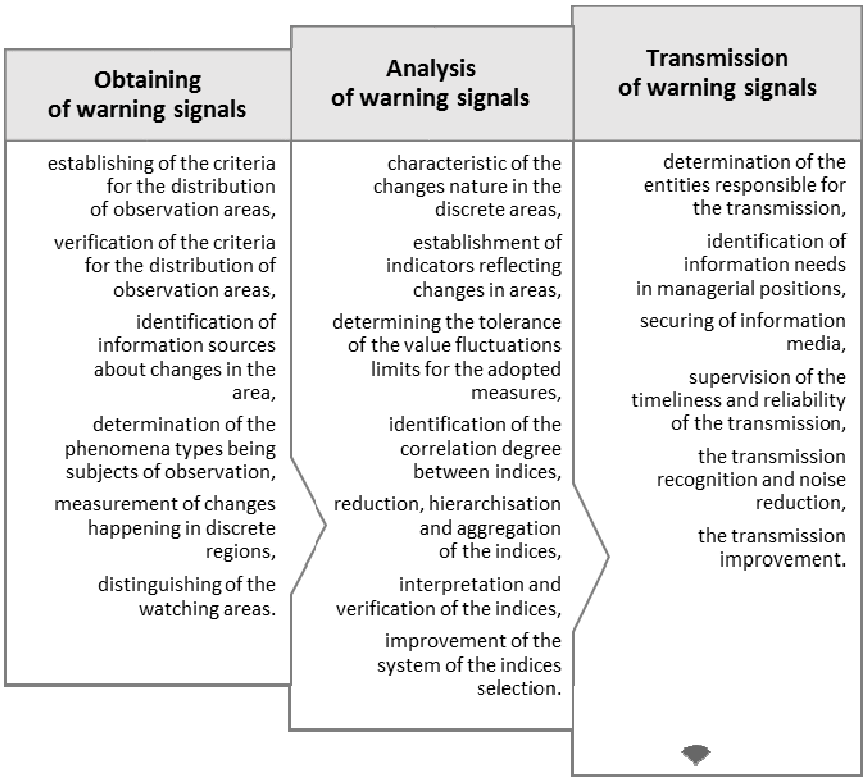

Fig. 2. Functions of warning signals in the early warning systems
Source: elaboration based on (Cabała, 2003)

While designing early warning systems, achievements of the diagnostics theory should be used. Information flowing into such a system would have a post of measurement signals, which are the values of individual numbers or aggregated indicators or images obtained by measuring certain quantities: economic, technical, social, psychological and other (Kerzner, 2013b). The proposed model of such a knowledge based system is shown in Fig. 3.

One of the more important elements of the early warning system is a diagnostic module. It covers the observation area, information gathering and their analysis. The observation zone is a space in which several procedures take place, like: the monitoring and recording of weak signals from the enterprises' internal and proximal external environment, also called the sectoral environment and flowing from the further external environment.

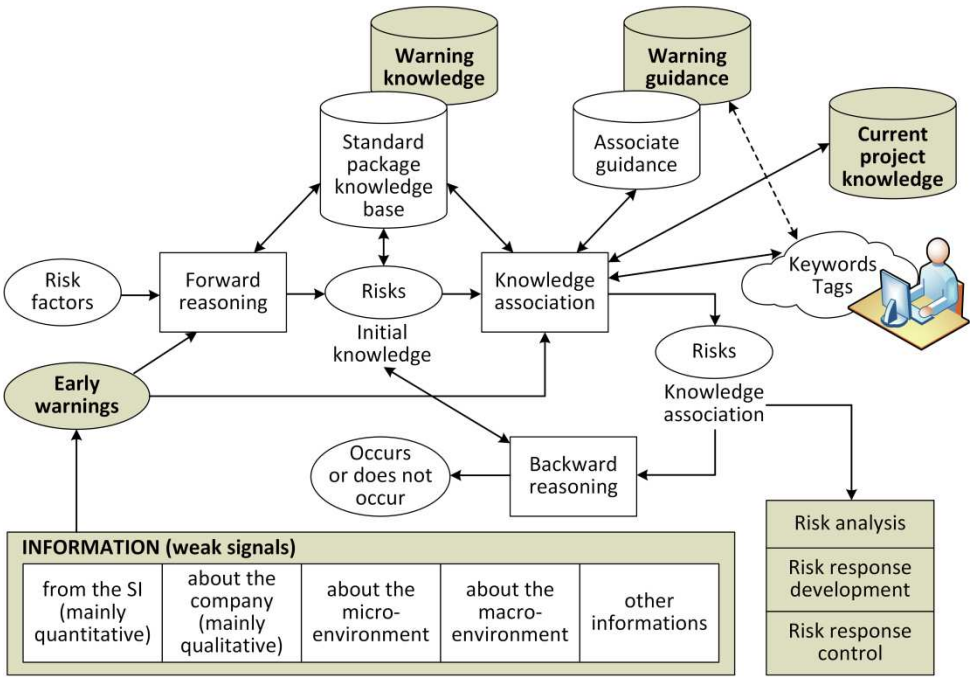

Fig. 3. General model of the early warning system based on the knowledge
Source: elaboration based on (Nikander, 2002; Niwa, 1989)

The challenge for project managers is to create an early warning system, which would allow the enterprise to transform incoming weak signals into useful information used in project knowledge management. The response, of the management to the quality of the flowing information into the early warning systems, may be the use of the weak signals concept, because it is assumed that every event, every change is preceded by a series of information which, even though they are difficult to obtain (weak signals, as unstructured and incomplete) allow to undertake actions securing the enterprise against the consequences of change (or at least give time for the appropriate response). For example the performance indicators in the earned value method EVM (Fleming, Koppelman, 2000) may be considered to assess the risk of the project implementation in terms of budget and schedule. In the early warning system they constitute a kind of weak signals, which transfer information about the work progress, as well as being a valuable source of knowledge about the potential risks and opportunities concerning the project accomplishment. The proposed warning system in the project management takes the form of a specific applicant system, and may have a structure typical of the classical fuzzy system (Pisz, Łapuńka, 2015). During the projects implementation based on the EVM method, the input variables are the indicators (including deviations and forecasts): CV, SV, CPI, SPI, TCPI, ETC, EAC, VAC. At the system output, indicators of the project's risk level, it means the project's budget and project's schedule, are received (Kemps, 2000). In addition, it is proposed to link prediction of threats with the identification of project's risks, so in the addition to EVM, the use of the schedule risk analysis SRA is assumed (Vanhoucke, 2011). In the system used to predict risks and opportunities, alternative methods for tracking the project will be used, such as: "top-down" in case of the SRA method as well as "bottom-up" for the EVM. The information obtained on that basis will constitute a kind of weak signals in the corrective actions undertaken during the project implementation and will provide knowledge about the use of buffers (tolerance) built into the project's base plans.

An effective aid of the early warning systems are computer tools utilizing knowledge. In the processing of qualitative information, poorly structured, knowledge systems are useful. In the problems of the early warning, the knowledge system should help, among others, to integrate various methods and concepts of the early warning, to manage numerous collection of diverse information, to explain and interpret various information. As already mentioned, it is crucial to reduce the mistakes made while identifying weak signals. With regard to the early warning systems in the projects, it is necessary to maximize the correct assessment and minimize incorrect assessment resulting from the analysis of signals.

For example, expert systems can be used to perform logical-algebraic operations and to process relatively well-structured qualitative information. The usefulness of computer tools using the knowledge, such as the knowledge system network, rule-based expert system, a system of interactive paired comparison and a system dynamic simulation research is an issue analysed both theoretically and practically (Matusek, Zoleński, 2013; Łapuńka, Pisz, 2015). Compared to the information resulting from direct observations, experiences and expectations, the information is more comprehensive, more accurate, more detailed, it explains better the nature of the risks and enables the formulation of tasks for individual departments and undertaking of ordered, systematic preventive actions (Zoleński, 2010).

The problem of acquisition of knowledge of potential project risk sources, the structuring and processing of such knowledge is, in the case of project management, a relatively new and not fully researched area of study. In the proposed approach (Łapuńka, Pisz, 2015), we aim at formulating certain rules in the relations between risk probability and its impact on the risk level of a project. The experience and knowledge of experts is required in order to elaborate effective decision rules. The representation of risk parameters in the form of IF-THEN rules constitutes the basis for a knowledge base in the architecture of the proposed expert system, dedicated to project risk assessment. The problem of knowledge representation is an important issue for expert systems dedicated to project risk assessment. Defining the relations between risk factors, the probability of their occurrence, their impact at the input, and the project risk level at the output of the inference model forms the basis for elaborating effective rules in the knowledge base of an expert system. The module of knowledge acquisition in the elaborated expert system is responsible for the process of information obtaining and updating, being stored in the knowledge base. This module implements procedures to support the acquisition of new knowledge obtained, among others, by the transformation of incoming weak signals into useful information.

Conclusions

The complexity and uniqueness of the projects as well as the discontinuity of the effects in the environment, significantly impact the inability to eliminate the risks and subsequently lead to changes during execution. The introduction in the enterprise things such as: principles, methods, mechanisms of knowledge management and project risk, e.g. by implementing into the project management the early warning systems can minimize the impact of unexpected, at the stage of initiation of the project, negative phenomena. The model of the dedicated early warning system should help policy-makers at the stage of the project's planning and implementation, enabling undertaking decisions regarding its accomplishment and elaboration of the response plan in the case of appearance of a particular type of risk and / or opportunity. Early information concerning risks enables to eliminate effectively later problems, in meeting the project's schedule and budget, simultaneously constitutes a potential source of opportunities to accelerate the project implementation and / or project implementation below the assumed budget.

The functioning of modern organizations increasingly depends on the amount of material resources, and increasingly from the intangible assets at their disposal, including intellectual assets as well as the project knowledge. The world has entered an era in which the ability to acquire and process information and knowledge creation becomes the basis for economic success (Toffler, Toffler, 1995). Organizations who obtained the ability to acquire adequate information and skilfully use it at the right time, before it is used by the current or potential competitors, they seem to be better prepared to operate in a turbulent environment. Those, who do not own aforementioned competences, or are not sufficiently developed, must implement and master solutions which enable effective management of strategic information. Implementation and improvement of specific system solutions, however, must be preceded by empirical research, aimed at better understanding of people's activities in the aforementioned processes, identification of strengths and weaknesses of applied solutions and the improvement of their functioning (Bąk, 2005).

Abstract

The case study discusses the application and use of globally provided ERP system in AMF Reece CR, a world-renowned producer of industrial sewing machines. The study describes the process this manufacturing enterprise followed when selecting the supplier and the specific solution as well as the characteristics of the ERP system functionality and technology that were important for the enterprise. The study also focuses on key aspects of the implementation project. It deals with addressing the requirements specific for technology preparation and production of industrial sewing machines. The conclusion of the study reviews the benefits and experience gained by the enterprise in relation to the use of the new system.

Keywords: Information system, Enterprise Resource Planning (ERP), Production Engineering (TPV), Manufacturing Resource Planning II (MRP II), DOP (Dynamic Order Processing), Workflow, Document Management System (DMS), Application Implementation Methodology

1 Introduction

AMF Reece CR is a world-renowned producer of industrial sewing machines, operating mostly in Europe, Asia and North America. In order for the company to be competitive on a global scale, it requires process automation covering the whole life cycle of production, sale and service of sewing machines. For this reason the management of the company decided to implement an information system change that would enable process and operation integration and standardization.

The establishment of AMF Reece CR is closely related to the history of Minerva, a traditional Czech brand. 1961 was a major milestone as in this year the Prostějov enterprise was incorporated in the Minerva state enterprise with headquarters in Boskovice. The Prostějov plant produced clothing buttonhole machines and linen buttonhole machines were manufactured in Boskovice. Between 1976 and 1988, both plants were parts of the Elitex concern.

The current shape of the company started to form in 1991 when the two biggest sewing machine producers in the market, i.e. AMF Sewt Products Inc. and Reece Corporation, merged. The latter bore the name of its founder, John Reece, who developed the first mechanical eyelet buttonhole machine in the United States in 1881, thus starting a revolution in the sewing industry.

The newly established US company, under the name AMF Reece CR, bought Minerva Prostějov in 1995 and thus followed in the tradition of industrial sewing machine production, both Czech and American. The company subsequently underwent significant restructuring that resulted in all production being concentrated in the Czech Republic. In 2009, Czech entrepreneurs bought it from the US owners and since then it has been funded solely by Czech capital.

Presently the company employs 130 workers and its revenues reach nearly 670 000 USD (2014). The greatest proportion of the sales is aimed at the markets of Germany, United States, Japan, India and Hong Kong.

2 Research Methodology

The Center for Investigations into Information Systems performs annual research of the Czech business information system market, which includes compilation of case studies in the form of qualitative interviewing and projection interview with workers responsible for IS/ICT investments in the particular organization. In 2005–2015 the authors executed over 130 case studies in manufacturing, business and service enterprises in the Czech and Slovak Republic.

The following sources formed the theoretical basis for research methodology application: Gill, Johnson, 1991 and Pavlica, 2000. The findings presented in the book Case Study Research (Yin, 2003) were used for case study execution. The practical experience of The Center for Investigations into Information Systems as well as long-term study of the following expert publications serve as the theoretical basis for implementation project realization and evaluation: Voříšek, 1997, Davenport, 1998, Molnár, 2001, Basl, 2002, Olson, 2003, Olson, Chae, Sheu, 2005, Smejkal, Rais, 2006, Laudon, Laudon, 2006, Schwalbe, 2007, Pour, Gála, Šedivá, 2009.

The authors were also inspired and studied theoretical findings on implementation projects presented in the studies of analytical organizations focused on global and Czech market, such as: Deloitte Consulting, 2000, Accenture, 2001, Hestermann, Anderson, Pang (Gartner), 2009.

When processing the case study, the authors also used publications dealing with advanced production and supply chain planning and management by: Fischer, Hammond, 1994, Fischer, 1997, Lee, 2002, Chopra, Meindl, 2004, Vollmann et al., 2005, Stadtler, Kilger, 2008.

3 Basic Characteristics of Investigated Organization

3.1 Main Products, Process Orientation and Business Model

As mentioned above, AMR Reece CR focuses on the production and supply of its own industrial sewing machines. The product portfolio of the company is complemented by selected brands of tried and tested machines manufactured by other producers that it provides service for as well. These additional activities constitute about 15% of total revenue. All products are sold through the company business network and by contractual commercial agents, mostly in Asia and South America.

AMR Reece CR covers the whole life cycle of the sewing machine from its production and sale to service and spare part supply. The manufacturing programme is aimed at special industrial sewing machines including eyelet buttonhole machines, chain stitch sewing machines, decorative hand stitching machines, autojig machines and trouser sewing units and many others. Among other things, the company also manufactures spare parts for its machines, offered presently as well as historically.

AMF Reece CR currently offers 12 basic sewing machines with 80 derived variations. Three new machines are in the development stage. The product bill of materials consists of about a thousand parts, 90% of them being manufactured in the Czech Republic. At the same time the company maintains a portfolio of older sewing machines if they are demanded on the market and therefore is able to manufacture and supply them based on a customer's order. On average, the company produces 27 machines a month while an order may consist of one or more machines.

3.2 Quality as Competitive Advantage

What is the reason of success of a relatively small Czech enterprise in global markets? Romana Plačková, Organization Manager, mentions the following causes: *"The greatest value for our customers is the high production quality, which is also the key competitive advantage of the company. We experienced a period when the market was flooded with cheap Chinese copies; however, the manufacturers were not able to ensure comparable quality. By that I mean mainly the production technology. This shows in the long lifespan and low failure rate as well as the high level of sewing, which is not as trivial as it might look at first sight."*

Quality is closely related to the development of new products, which the company lays great emphasis on. It runs an extensive development department cooperating closely with the technology division and tool factory that focuses on preparing prototype components. The development has to be in line with the customers' requirements as well as with the requisite that a new or innovated machine will be asserted on the market. The development of a new machine takes approximately two years and continuous innovations concerning the existing ones take place. Before a machine is launched, thorough tests are performed with thousands of working cycles to confirm the life spans of respective components.

Provision of service is an important element to the high product quality for the customer. For this reason the company maintains extensive service base that enables specialists to go to customers all over the world and address not only requests communicated in advance but also any issues that might arise on site.

4 Project of New ERP System Selection and Implementation

4.1 Tender

The MFG/Pro information system was in place in the company for many years. However, it was not applied universally to all required processes, some areas were not interconnected and the server performance was inadequate thus restricting comfortable use of the applications. In 2006 the employees in charge started to collect information concerning information system possibilities available on the Czech market. They also accomplished several reference visits to get a more realistic idea of their practical utilization.

From 2007 grants were available within the ICT programme for enterprises and AMF Reece CR was among the applicants. The company adapted the tender to the respective regulations and in summer 2008 the offer of IFS application ERP system by Altec was finally selected as the most suitable one.

The proportion of price/quality/added value of the complete solution was a definite competitive advantage of the winning offer. Besides, the IFS Applications fulfilled all key requirements of the contracting entity. The first set of requirements concerned the functional and technical characteristics of the system.

4.2 Required Functional and Technical Characteristics

IFS Applications is a globally supplied ERP product with legislative and service support available in many countries worldwide. This becomes significant when the company decides to establish a full affiliate outside the Czech Republic. Moreover, worldwide standards and best practice in field and process solutions are available, which cannot be expected from local systems.

There is another advantage – the fact that the IFS Applications are built upon a unified process and data model. That way the users provide data to the system only once from one location and at the same time they get the same version of the truth in all outputs. They utilize unified data and

functional system bases that form one robust and secure unit enabling comfortable use not only at the client work stations but also on all kinds of mobile devices.

IFS Applications can also be connected to Shuttle, a special storage system by Kardex that AMF Reece CR used before the new ERP selection

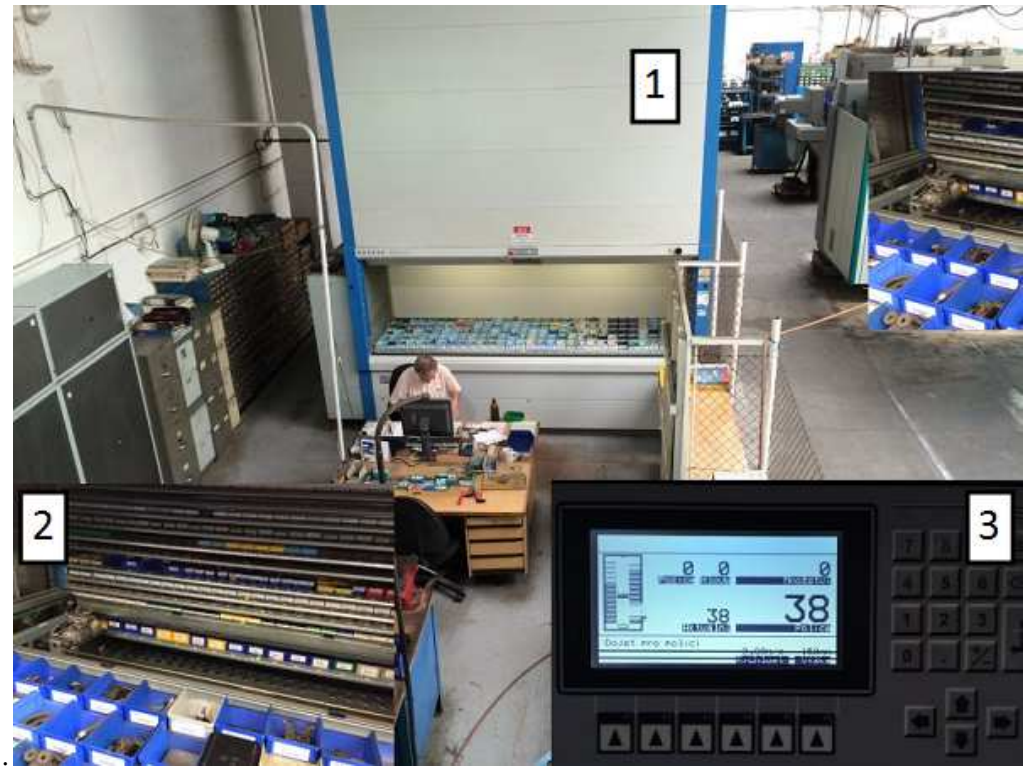

Fig. 1: Shuttle storage system (1), Detail of storage items organization (2) Control panel (3) (prepared by us)

4.3 Implementation Requirements

The second set of requirements concerned the feasibility of the implementation project. Altec offered an experienced team of consultants and comprehensive implementation methodology complying with the IFS standards (Application Implementation Methodology). Thus AMF Reece CR did not have to worry about the project not being successfully completed by the supplier or the users not being lead and trained professionally.

One of the key implementation objectives was to transfer all existing engineering principles to the new ERP system. The users requested the level of comfort provided so far by the TPV application by Sysklass to be maintained, therefore this area was modified to accommodate their needs.

Last but not least, production dispatch based on barcodes, previously implemented by the company, had to be put into operation. For this reason the existing system had to be respected and the relevant inputs of the new ERP had to be modified.

4.4. Project Execution

The implementation project started in the last quarter of 2008. After system application and adaptation in the key functions, data transfer and users training, operation under 3-month supervision was commenced, at the beginning of 2009. After handover for full operation the system was fully functional in accounting and finance, purchase, production and sales. Other processes, mainly quality management, change management, workflow and document management system (DMS), were only fully covered within system upgrade to version 8.

"Due to the tight schedule it was necessary that people adapt to the new system quickly and get used to different work process organization. The lack of time had a positive effect during training as the users were forced to engage thoroughly and with great intensity. As a result the users demonstrated freshly acquired command of all the crucial information and knowledge and operated the system without difficulties," says Romana Plačková.

"A guarantor was appointed for each area as a person responsible not only for its coverage but also for the key users´activities. People were aware of the necessity to possess good system knowledge and operation skills; however, financial motivation was required to complete the implementation successfully," adds Romana Plačková.

Table 1: Principal Data on IFS Application ERP System Implementation (prepared by us)

ERP system	IFS Applications
Version	8
Implementation partner	Altec
Period of implementation	5 months (November 2008 – March 2009) including routine supervised operation started on 1 January 2009
Last Upgrade	5.5 months (September 2013 – February 2014)
Number and type of users	45 named users (after upgrade 70)
Server operation system	Microsoft Windows Server 2008 R2
Database platform	Oracle Database 11g
Architecture	Three-tier client/server, using the thin and thick client technology (in production)
Processes covered by system	Accounting, finance, controlling, purchase, sales, engineering, operative production management, human resources, quality control, change management, workflow, document management

4.5 Entries Modification and Engineering Transfer

The only non-scheduled change that had to be addressed operatively during implementation was the transfer to a different system of accounting entries. Originally this process was set and performed in compliance with stock records. Consultants from Altec proposed accounting by account groups. This proposal was accepted and implemented with the assistance of the experienced partner. The process became more transparent and simplified, which proved to be a significant secondary benefit of the implementation project.

The existing engineering principles were also transferred within project execution. Thus the IFS Applications are able to manufacture several product varieties. This means a machine is manufactured with a component that is also significantly innovated by development or newly designed. The system is able to differentiate which particular products will be manufactured with the original component and which ones will be manufactured with a completely new component. Thus it enables work with different product varieties by following changes in technology and development.

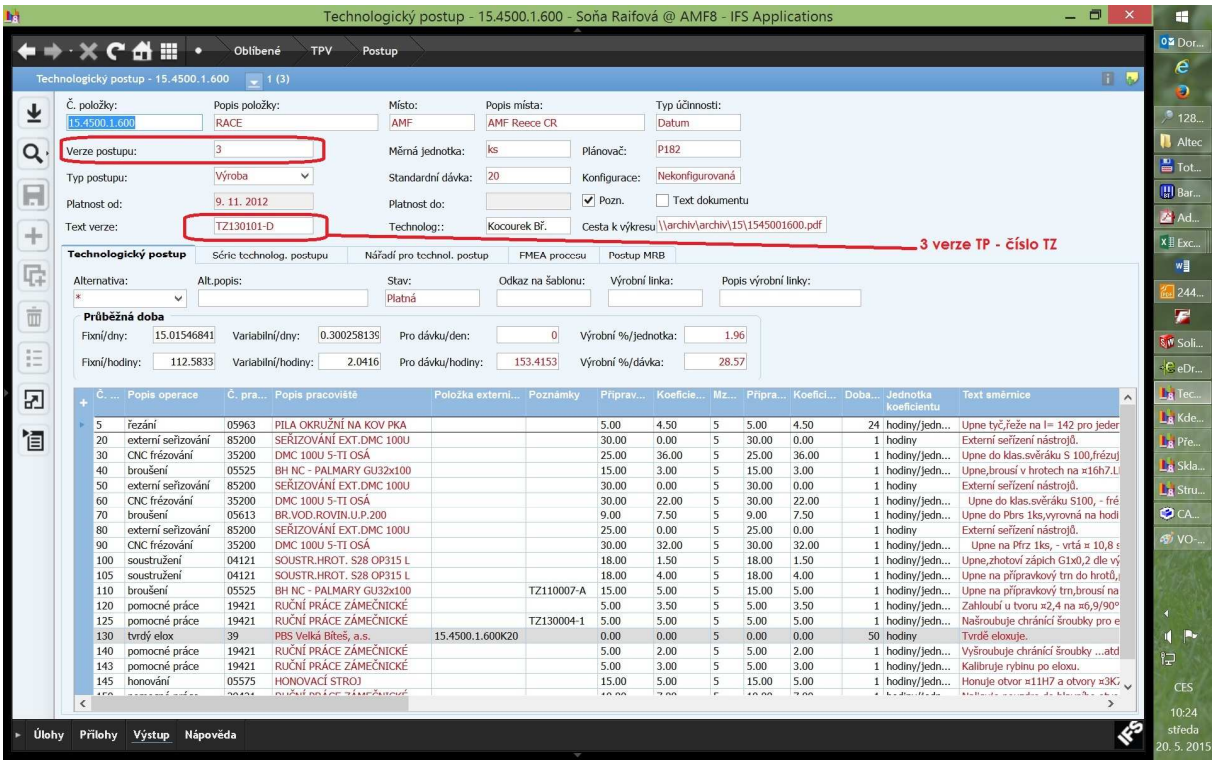

Fig. 2: Work with different technology process versions (prepared by us)

Cost management was organized on the same basis. Costing is performed not only in relation to price of the individual components but also to the changes applied within development. For this reason the system has to be able to differentiate between costs and prices calculated in different periods, e.g. months. Otherwise the worker in charge would have to perform a complex search of the changes by reviewing thousands of items.

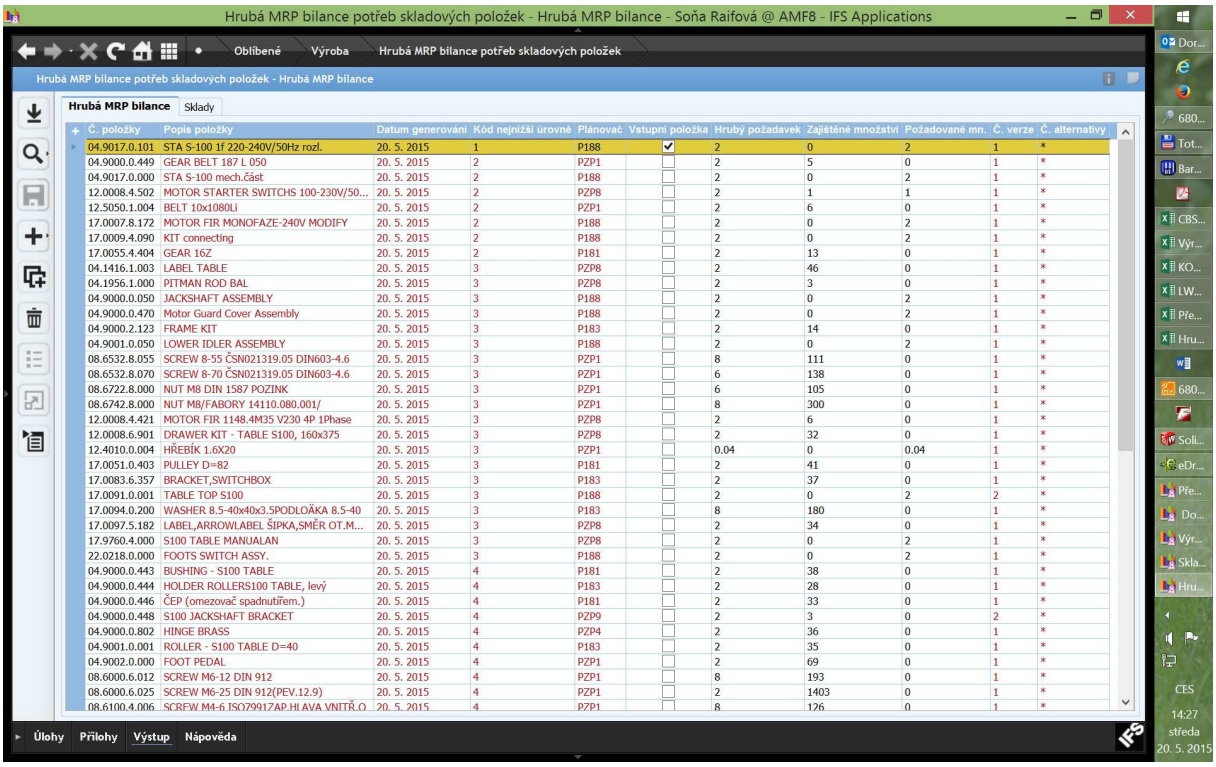

Fig. 3: Stock Item Needs Review within Manufacturing Resource Planning

4.6 Upgrade as an Opportunity to Extend System Functionality

New requirements arose during the routine operation period that could not be met by the originally purchased version without significant programming modifications. However, such modifications would not be efficient or economical. Therefore, at the earliest opportunity to transfer onto the new modern version 8 the decision was made concerning technical innovation as well as functional extension of the system.

The system upgrade took place from September 2013 till February 2014. Document administration, change management and workflow are among the key newly covered functional areas. The number of users increased from the original 45 named ones to the total of 70.

5 Conclusions

The IFS Application ERP System project accomplished the planned benefits on several different levels. The first one may be classified as generally expected benefits, focused on solutions to existing and visible problems. These include particularly the data base and company processes integration throughout the organization, providing a single version of the truth in all system outputs and entering data from a single location.

Another level of benefits runs deeper into the organization management as such. First of all, the processes and operation were standardized, which brings considerable simplification of top and middle management. This basis facilitated the implementation of development management, which requires a great amount of time and financial resources. Production planning and management improved significantly as well.

Considering the nature of market environment, the system had to be used more in operative planning and management based on the MRP II principle (Manufacturing Resource Planning). This means namely focus on efficient stock management so that sufficient amounts of the particular components are available in stock, which sometimes means maintaining safety stock, sometimes the possibility of subcontractor supply in short time by the customer's order.

"IFS Applications truly help us, mostly in the operational area. We need to decompose a product to the individual components, check their time, economic and logistic availability or the stage of production if they are being manufactured within our operation. For this we use DOP (Dynamic Order Processing)," says Romana Plačková.

"I also appreciate the cooperation with Altec. They provide not only high-quality support, which is actually to be expected from a partner representing one of the best ERP systems. I particularly wish to stress the professionalism of the consultants who proactively come up with suitable solutions, which we welcomed for instance in relation to the accounting system transfer. Naturally, such an attitude markedly increases the added value of the solution as a whole," says Romana Plačková.

The benefits of the new ERP system application and operation can be generalized as follows:

- Data base and company process integration throughout organization
- Single version of truth in all system outputs
- Data entering from single location
- Process and operation standardization
- Development management implementation
- Improvement in production planning and management
- Dynamic Order Processing implementation to improve operational contract management
- Support of everyday decision-making at all company levels

Abstract

This paper is dedicated to the research of subsequent evaluation of goodwill and is mainly aimed at a comparative analysis of 'amortization approach' and 'impairment-only approach'. Under a lot of criticism concerning goodwill amortization, in 2004 in IFRS the approach of 'goodwill amortization' was replaced by 'impairment–only' approach. In spite of the validity of the 'impairment testing' approach to the subsequent accounting for goodwill, which is based on the essence of treatment of 'goodwill', the application of this method in practice by companies has revealed a number of significant drawbacks. The return to the 'amortization approach' can make the financial reports more transparent and eliminate 'subjective factor'. At the same time, 'impairment of goodwill' approach enables companies to reflect the specific features of their activities and the effect from business combination. The research was carried out to estimate the impact of chosen method subsequent accounting for goodwill (impairment or amortization) through the analysis of sample of companies located in different countries. Besides, it presents 'pros and cons' these methods.

Keywords: accounting for goodwill, impairment, amortization, consolidation financial statements

Introduction

Such specific element of the consolidated financial statements as goodwill has been causing a lot of discussion. In particular, there is an ambiguity of opinions in regard to measurement of goodwill after initial recognition. Thereby, this paper focuses on reviewing of the most controversial aspects in regard to subsequent measurement of goodwill both from theoretical and the practical point of view. There are two main approaches to the subsequent measurement of goodwill: amortization approach and impairment-only approach. These methods also may be used simultaneously.

Under a lot of criticism concerning goodwill amortization this requirement was replaced by 'annual impairment test for goodwill' as part of the cash – generated unit in 2004 in the international standards. The main arguments against goodwill amortization were that it cannot determine the useful life correctly and is in non-compliance to the nature of goodwill.

In spite of the theoretical assertion that the 'impairment testing' approach to the subsequent accounting for goodwill is based on the essence of treatment of 'goodwill', the applying of this method in practice has revealed a number of significant drawbacks. Some companies don't calculate impairment of goodwill according to the requirements of standards or some of them don't disclose information about the assumptions in the measuring of the recoverable amount of the cash-generating units made by managers and about the allocating goodwill to those units. As a result, the information presented in the financial statements has become less transparent and comparable between the companies. It is also because the subjectivity of 'impairment approach' significantly higher than 'amortization approach'.

The research was carried out to estimate the impact of chosen methods subsequent accounting for goodwill (impairment or amortization) through the analysis of such large and long-time operating companies as: Vodafone Group (UK, since 1983), Bosch Group (Germany, since 1886), Philips Group (Netherlands, since 1891), Nestle Group (Switzerland, since 1866), Sberbank Group (Russia, since 1991), VTB Group (Russia, since 1990). This study was conducted in order to identify the main trends of calculating impairment losses of goodwill and disclosing the information about it in the financial

statements. Besides, the research was carried out to assess the possible influence of returning to amortization on the main company performance indicators.

On one hand, the return to the 'amortization approach' will help to make the financial report more transparent and eliminate 'subjective factor', which creates the conditions for veiling in the financial statements. On the other hands, 'impairment of goodwill' approach enables companies to reflect the specific features of their activities and the effect from business combination. In addition, in conditions of preparing financial statements without 'predetermination' of profit results set by managers or company's owners, the 'impairment of goodwill' approach will provide more accurate results than applying of 'amortization method'.

Historical background

The history of legal and professional regulation has a fundamental impact on the accounting methods and principles accepted today, even at the international level. International standards are unusual because they combine the features of the accounting culture and auditing practices of different countries contributing to their emergence. For more details on the impact of each parts of culture see in a research study by Zeff (2007). About the history of development of accounting theory in Russia in XX century see in the book by Mattessich et al (2008, Chapter 15, p. 246-264). The practical application of IFRS in Russia in 90s XX – the early XXI is revealed in a research study by Genaralova et al (2015) and in a research study by Kovalev (2014). In addition, the spread of the accounting profession and improving of education system influence on national and international accounting significantly (see more details in the paper by Chen (2008). The specifics of the development of Russian accounting education are disclosed in a research study by Karelskaia and Zuga (2014, p. 269). The process of formation of professional societies in Russia is described in the paper by Sokolov V. (2015). Moreover, as it is was shown throughout the history, 'pioneers' or initiators have a special influence on the development of international regulators and regulations. Thus, the development of conceptual ideas and accounting in accordance with IFRS has been influenced by the legislative requirements of the countries whose representatives took an active part in the creation of the international standards.

In 1978 the topic of business combinations was placed on the agenda for consideration by IASC with some apprehension due to the understanding that this is a very controversial issue. At that time, amortization was used as a subsequent measurement of goodwill according to national standards of majority of the countries and Fourth EC Directive. The difference was only in the duration of the useful life: according to APB Opinion № 17 (US GAAP) it was 40 years; and in according to Fourth EC Directive it was 5 years. In 1983 IAS 22 "Business combination" has been approved. So, amortization over 5 years was established as a subsequent measurement of goodwill to bring into conformity with existing practice and requirements of Fourth EC Directive (Zeff, book 2007, p. 137). However, despite the approval of IAS 22, the subsequent accounting for goodwill had remained one of the issues that have no absolute decision.

Also, according to quantitative and qualitative analysis of more than two hundred Russian and foreign scientific papers about accounting for goodwill and published from 1990 to early 2000s, it was found that the most controversial of all issues in relation to accounting for goodwill is its measurement after initial recognition (Generalova, Popova, p. 53-60).

And as a result of intense debate in the West, since 2001 according to US GAAP the 'impairment approach' has been used instead of amortization (SFAS 142 "Goodwill and other Intangible Assets" и SFAS 141 "Business Combination"). The reason for the abandonment of amortization was the following arguments. Firstly, the majority of analysts when making decisions for investments ignored the value of amortization of goodwill in the process of calculating the relevant operational performance. This was done to eliminate the influence on the fluctuation of the profit the factor of transition from date of implementing of goodwill amortization to date of cessation of amortization. Secondly, appropriate testing for impairment with qualitative disclosure would facilitate financial reporting transparency (Fabi and others, 2014, p. 11). So, in IFRS in 2004 there was a transition to the model of 'impairment' of goodwill

and refusal the ‘amortization approach’. Including, this was carried out in accordance with the idea of convergence of US GAAP and IFRS.

But despite the "consent of the majority" to make the transition to ‘impairment model’, rear-view has emerged by nowadays due to the existence of the negative aspects associated with the procedure of impairment of goodwill in practice. Rear-view consists in the following opinion: “Perhaps, the return to amortization is a necessary measure to overcome the existing practical problems associated with the implementation of ‘impairment approach’ to subsequent measurement of goodwill”. It is also worth noting, that the problems of accounting for goodwill arisen in practice should be considered combined with the difficulties of consolidation procedures, such as issues of perimeter of consolidation (for more details, see Crişan P. & others, 2012).

Amortization versus impairment of goodwill: pros and cons

The difficulties of implementing the impairment model in practice

After IFRS 3 “Business combination” had been released in 2008, IASB reviewed the results and consequences of the application of new the standard (PIR – Post-implementation review). It has been called into question: "Whether testing goodwill for impairment able to reflect the entity's exposure to adverse economic cycles? Besides, it was also caused concern about the subjectivity of information generated by the impairment of goodwill (PIR, 2015, p. 12).

Thus, the transition solely on impairment approach entailed existence of misinformation of users: in the presence of obvious signs pointing to the need to recognize losses in accordance with IFRS (IAS) 36, companies don’t tend to show them in the statements. Besides, the problem is that losses from the impairment of goodwill are reported too late, i.e. out of time. Especially this “delay recognition of losses” is noticeable at the time of economic crisis (Fabi et al, 2014).

The next weak side of impairment approach marked by Russian authors is undergoes to value judgments (Generalova, Sokolova, 2014). Firstly, The exposure of impairment procedures to value judgments arises from specificity of the impairment model contained in the standard: 1) the allocation of goodwill to the strong or weak CGU; 2) the determination of the date for impairment procedures; 3) the use of the most recent detailed calculation made in a preceding period of the recoverable amount of a cash-generating unit to which goodwill has been allocated for the current period (see p. 99 IAS 36); 4) dependence on the choice of valuation of non-controlling interest (see p. C4 IAS 36). Secondly, there are uncertainties arising directly from the impairment model: 1) calculation of forecast cash flows is subjective; 2) determination of the discount rate (increase/decrease by an insignificant amount of the discount rate may lead to recognition/non-recognition of impairment losses).

Sokolov J. in the work "Accounting and economic crisis" outlined: “An economic crisis arises due to errors by people who responsible for making economic decision. In its turn, these mistakes are the result of an inadequate data presented in the financial statements for the subjective and objective reasons. First of all, subjective errors relate to the unfounded hopes, which are embodied in the asset valuation”. (Sokolov, 2009, p. 18). Goodwill is an asset, too.

Decision ways

There are at least two solutions: the first is improving the impairment model, the second is return amortization. Standards’ developers follow to the first variant. According to such opinion it is need to minimize the cost of implementation of impairment procedures. (PIR, 2015, p.16). Members of the professional community, representatives of professional organizations and scholars have an opposite opinion

Arguments in favor of return to the amortization

The first argument: "Amortization of goodwill reflect the consumption of economic resources obtained in a business combination over the time" (Fabi and others, 2014).

The second argument is a "larger" degree of reliability of the information provided, because there is no need to disclose the numerous and ambiguous parameters for calculating replacement value of CGU to which goodwill is allocated according to impairment model. Is needed only the initial cost and useful life.

The third argument follows from the second: The ease of measurement is the key to the comparability and the verifiability of reporting data of companies worldwide.

The practice: research of the effect of implementation of the 'amortization approach' and the 'impairment approach' of goodwill on companies' financial statements

To study the effect of possible transition from impairment (the requirement of IFRS) to amortization of goodwill, we have carried out the research. The base of the research is the consolidated financial statements of the large companies operating stably for a long time in its industry. Data on the value of goodwill and data on the amount of costs related to goodwill (amortization or impairment losses) were calculated and compared. Besides, the research reveals the impact on net profit margin, return on equity (ROE) and return on assets (ROA).

The analysis of the large and long-time operating companies only doesn't provide enough representative results. But this study is intended to outline the main trends and the impact of 'amortization approach' and 'impairment-only approach'. In this paper this influence is showed in detail only at the example of companies. These companies are Vodafone Group (United Kingdom, mobile communication services, operates since 1983); Bosch Group (Germany, Electronics & Engineering, since 1886); Nestle Strategische Allianz (Switzerland, food products, since 1866); Philips Group (Netherlands, appliances, since 1891); Sberbank Group (Russia, banking, since 1991); VTB Group (Россия, banking, since 1990).

Analyzed period is from 2000 to 2014. The period for which the data were recalculated is from 2005 (2006) to 2014. The sample consisted of 62 statistical observations.

Briefly, in example of two companies show the main trends observed in the recognition of goodwill impairment in the statements.

Trends

As an example we take the Bosch Group and consider the changing the "cost behavior" associated with goodwill. Drawing attention to the columns 6 and 7 of Table 1 can be noted that the transition from the amortization (according to the German Commercial Code – Handelsgetzbuch; 10 years of useful life according to accounting policy) of goodwill to its impairment (since 2005), impairment losses recognized every two years steadily. 2009 was unprofitable for the Bosch Group. In 2011, as in 2013, there was a decline of basic indicators of the Group's activities (profitability, revenues, total balance sheet, and profit).
Note also that at drawing up of consolidated financial statements in accordance with German Commercial Code, the share of costs related to goodwill in the Bosch Group's operating expenses were higher than in the transition to impairment in 2005 in connection with the transition to IFRS.

Table 1. Acquired goodwill of Bosch Group and its subsequent measurement: amortization and the impairment amounts, 2000-2014, million euros

Year	Goodwill at beginning *(initial value)*	Good-wil the begin ning *(boo value)*	Increase		Decrease		Accumulated amortization / impairment at end	Disposal	Goodwill a the end
			Arrivals	Other	Amortization	Impairment

2012	4 884	4 121	-	556	**x**	**0**	758	-	4 682
2013	5 352	4 596	14	149	**x**	**34**	790	74	4 651
2014	5 441	4 651	4	71	**x**	**0**	128	668	4 720

Source: Bosch Group Consolidated Financial Statements for 2000-2014.

Example of Swiss companies – Nestle Group. Transition to IFRS by Nestle Group (from national standards) took place in 2003. Hence, the use of the goodwill impairment model began in 2005. Before this transition, goodwill was subjected to an amortization and the impairment testing. Fig. 1 shows how a saltatory change in the net profit of the Group "combined with" the trends of the recognition of impairment losses for goodwill of subsidiaries. The trends are as follows: impairment losses of goodwill (since 2005) were recognized mainly in the highly profitable years for the Group.

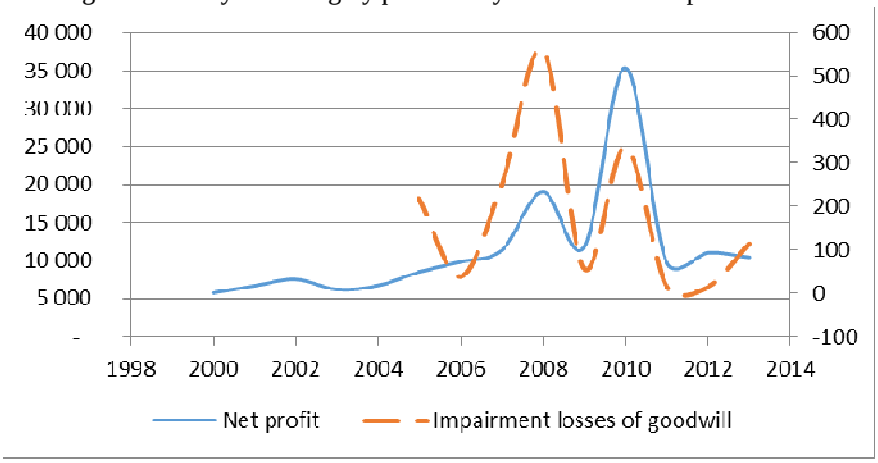

Figure 1. Comparison of the net profit and the amount of goodwill impairment losses, 2005 -2013
Source: Consolidated Financial Statements Nestle Group for 2000-2014
(*The impairment of goodwill is based on secondary axis).*

The effects of a possible transition to the amortization of goodwill on the profitability

Table 2 shows the results of the correlation analysis of the data before and after recalculation of net profit margin (NPM), return on equity (ROE) and return on assets (ROA), since 2005 to 2013. The correlation coefficients have been calculated according to data obtained from the analyze of the sample. The sample consists of financial data for the period from 2005 to 2013 obtained from financial statements of the companies observed. Then these factual data have been restated for the same periods of time according to assumption that goodwill has been amortized during the 10 years.

Table 2. Correlation coefficient data of profitability and impairment of goodwill amortization of 10 years, based on a sample of companies, 2005-2013.

	Net Profit Margin	**Return on equity (RO**	**Return on assets (ROA**
Correlation coefficient *(foe the whole period)*	**0,847566294**	**0,954148847**	**0,928573282**
2013	0,807688299	0,949775209	0,923641437
2012	0,811788862	0,951750241	0,926979954
2011	0,813927119	0,951724933	0,927481519
2010	0,814831605	0,952012296	0,928540426
2009	0,823543738	0,956176110	0,931045581
2008	0,824064223	0,956438302	0,931613558
2007	0,839090352	0,958525705	0,935430791
2006	0,840668704	0,958885067	0,937158280
2005	0,992062268	0,977914859	0,984784298

Based on the results of calculations, we can see that the values of profitability before recalculation (impairment; the actual reporting data) and after recalculation (amortization during 10 years useful life) have a low degree of deviation and correlation coefficient is positive and high (coef: 0,8 - 0,9). Consequently, the returning to amortization of goodwill during 10 years will not be substantially worsened for status of companies. Similar conclusion would be clearer if we look at the example of two of the companies in more detail. In Table 3 disclosed the calculated amounts of NPM, ROA and ROE for factual and recalculated data of the British Vodafone Group with deviation of these indicators (see columns 13-15). In Table 4 disclosed the calculated amounts of NPM, ROA and ROE for factual and recalculated data of the Russian Sberbank Group with deviation of these indicators (see columns 13-15).

Table 3. The total comparison of the effect on the profitability of Vodafone Group PLC (UK) during the transition from an impairment to the amortization of goodwill during of 10 years, mln GBP

Year	**In applying the impairment (actual da of CFS)**						**In applying of amortization of goodwill over 10 year (recalculation)**						Deviations (data in applying of amortization minus data in applying the impairment)

Fig. 2 shows the data on which it is possible to judge at what rate to a greater extent will be affected by the transition to the amortization of goodwill.

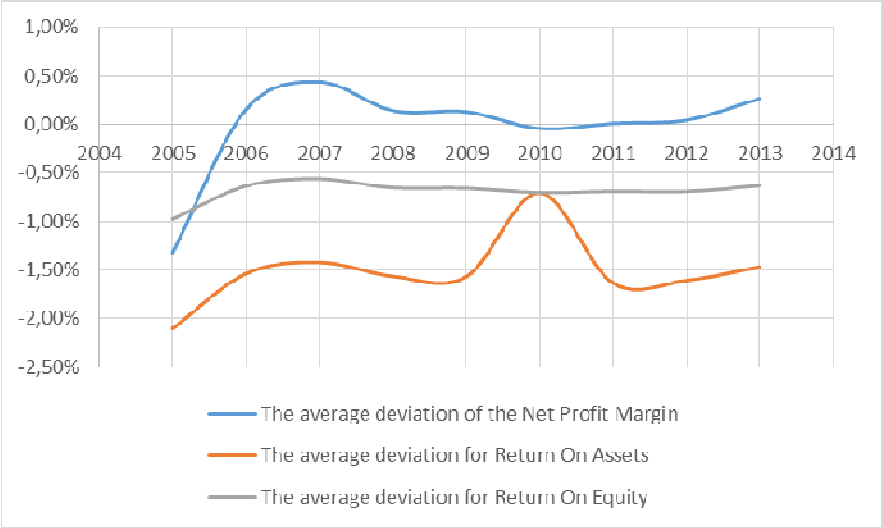

Figure 2. The dynamics of an average deviation of NPM, ROA, ROE in applying the goodwill impairment from values of the implementation of amortization during 10 years, 2005-2013

Table 5. Data on the average deviation of the profitability when an impairment of goodwill and amortization of 10 years, based on a sample of companies, 2005-2013

	Net Profit Margin	Return on equity (RO	Return on assets (ROA
The average deviatio	**0,10%**	**-1,28%**	**-0,53%**
2013	0,27%	-1,47%	-0,63%
2012	0,05%	-1,61%	-0,69%
2011	0,01%	-1,63%	-0,69%
2010	-0,04%	-0,70%	-0,70%
2009	0,13%	-1,57%	-0,66%
2008	0,14%	-1,56%	-0,65%
2007	0,44%	-1,42%	-0,56%
2006	0,16%	-1,54%	-0,63%
2005	-1,32%	-2,10%	-0,97%

So, based on this analysis the sample companies, we can note that a significant change in the Group's profitability indicators with the introduction of the amortization of goodwill will not happen. However, introduction of amortization instead of impairment (or along with) can contribute to leveling a series of problems, for which criticized impairment model applied today.

Conclusion

So, the question of goodwill measurement after initial recognition has remained one of the most controversial and unresolved issue in accounting. After refusal of the 'amortization' in favor to 'impairment approach' to goodwill subsequent measurement in IFRS, it found out that it demonstrated a number of disadvantages arising from uncertainties of impairment procedure. In this paper presents the advantages and disadvantages of amortization and impairment of goodwill.

The positive aspects of the applying of impairment as a subsequent measurement of goodwill consist of some opinion. According to this opinion, the information on goodwill formed 'impairment approach' (if it is adequate) and the proper disclosure are able to increase the transparency of financial reporting. Moreover, the 'impairment method' corresponds to the essence of goodwill, but it is not true for the 'amortization'. However, opposite case has happened in practice. We didn't come towards such transparency as we have been aimed. Applied research has shown that the disclosure of information about some parameters of the impairment procedure is ignored by companies and the impairment losses aren't reflected in the financial statements or appear after the time of appearance of negative circumstances.

With regards to goodwill amortization we can say that this method has a number of simple advantages. And at the same time, these advantages are very important. These advantages are ability to reflect the consumption of economic benefits from the business combination, reliability of the calculations (understanding them without narrowly specialized knowledge) and simplicity. However, in the global economy it is important to take into consideration the impact on business of the new methods approved in accounting. Accordingly, the authors have made an analysis of the impact of the return to the amortization on the analytical performance of companies' activity in several countries. So, with possible approving of requirement to amortize of goodwill it will be observed the decline of corporate profits. However, this reduction will not have a material impact on the change in the profitability ratios. Consequently, the "disastrous" influence on the attitude of the financial statements' users (particularly, owners) to companies will not be rendered.

In conclusion, it should be noted that in Accounting as a social science, the agreement between countries (or within one country) is more important factor than the perfection of created methods of accounting.

An Automated Algorithm for Generating Neural Networks for Stock Value Prediction

František Hortai, Brno University of Technology, Faculty of Business and Management, Brno, Czech Republic, hortai@fbm.vutbr.cz

Abstract

This paper deals with the design of a model creating algorithm to assist in trading on financial markets with the use of artificial neural networks. The research focuses on the design and optimization of artificial neural networks (in particular nonlinear autoregressive networks) and their subsequent usage in predictive application in stock market time series. The aim of this paper is to prove that a correctly constructed artificial neural network can be supportive in trading on financial markets by means of the ability to predict trends of stock prices.

Keywords: Financial market, prediction, artificial neural network, stock price forecast

Introduction

Investors are faced with large amounts of information and overwhelmed by opportunities and changes on financial markets. Generally, for a comprehensive picture of trading with financial instruments, their use is related to the principles of market sentiment (psychological analysis), technical analysis and fundamental analysis. Analysis and evaluation of this information is intensive in terms of both time and knowledge and is, therefore, costly. In our "fast" world, investors do not have the time or opportunity to search for deeper correlations between the information and data to create a comprehensive picture of future market developments.

For lack of the time and space required for a deeper market analysis, this article focuses on the methods of technical analysis and its advantages. Technical analysis assumes that the decisive factors for pricing on organized markets are the market offer and market demand. These factors include all the available information (fundamental data) as well as the degree of optimism or pessimism among the trading participants (Rejnuš, 2014). Technical analysis is not concerned with the price level or the specific causes of exchange rate changes, but focuses rather on predicting their direction and estimating the time at which changes will occur. Forecasting based on analysis can then be used in the timing of the "most profitable" investment, i.e. the purchase or sale of a financial instrument. The principal research is based on creating learning machines via artificial neural networks for real stock price predictions.

Theoretical section – a review of the literature

Technical analysis is based on scientific theory and a variety of empirically verifiable facts. A number of possible analytical methods are based on these facts. These methods are based principally on statistics, fuzzy logic, genetic algorithms, evolution strategies and artificial neural networks (Hortai, 2015).

1. Artificial neural networks

Artificial neural networks are inspired by nature. Their function is based on real neural networks (for example the brain) which they try to understand and model to simulate a logic system of how a real neural network thinks and evaluates information. Simplified mathematical descriptions of neurons are based on this concept and try to describe how a real neuron "thinks". Artificial neurons and artificial neural networks are special mathematical algorithms that can simulate the logical operation of biological neurons and neural networks, thereby imitating intelligence for specific tasks (Russell, Norvig, 2010).

To describe the basic architecture of a neuron (basic perceptron) the following essential parts and concepts are represented: inputs (x_i), outputs, weights (w_i), bias, transfer function, and threshold (Dostál, 2015).

A description of the behaviour of a mathematical model of a neuron can be based on the following equation:

$$Y = f\left(\sum_{i=1}^{N} w_i x_i + bias\right)$$

The vector of input values (x_1, x_2, ... , x_n) is multiplied by a vector of synaptic weights (w_1, w_2, ... , w_n) for each "dendrite". A threshold bias, which may take negative values, is added to the total sum. When the sum is greater than zero, the resulting value is transformed into the output of an activation function also known as a transformation function. Transformation functions can be of various types (Dostál, 2015).

Neural networks have a wide range of applications. Their architecture is generally adapted to the purpose for which the neural network has been created. There is no universal network topology capable of effectively solving all kind of complex problems. Due to the variability of neural networks, they can be categorized from different perspectives (Šíma, Neruda, 1996):

1.1 According to their complexity and network topology:

The number of layers and number of neurons in a given layer; these may be (Dostál, 2015):

- Single-layer networks (used for linear separable problems)
- Multiple-layer networks (standard classification problems, simulation algorithms, the prediction of a direction or value)

The cyclicality of links (direct – acyclic, cyclic).

Organization (solid, self-organization).
The number of neural networks that are an interconnected network of networks (problems that require the processing of more inhomogeneous logic inputs, complex decisions dependant on multiple data sources).

Complexity – continuously optimizing decision-making systems based on the interconnection of many different functions and NN with input filters (analytic decisions based on experience).

1.2 According to the dynamics of data

According to Fanta (2001) data can be:

Static – data logic not varying over time, static (for example, the simulation of mathematical functions).
Dynamic – input data networks are time variable (for example, time series).

1.3 According to application:

According to Hagan et al. (2014) these application can be used for:

Algorithm imitation – a neural network can simulate an algorithm or an operator without being known to the mathematical rule.

Clustering – looking for the elements in a set of elements with similar properties that are different from other groups.

Prediction – can roughly simulate future development on the basis of historical values.

Classification – places elements of the set to the correct category.

Pattern recognition – used to recognize patterns in the data, for example image patterns, mainly used for computer vision methods.

1.4 According to the methods by which a network learns:

Russell and Norvig (2010) divided learning methods into:

Supervised learning – the neural network learns by comparing the actual output with the output required (teacher) and then adjusts the balance of synapses to reduce the difference between the actual and the desired output. Recurrent – the result or its error leads to adaptations of the initial calculation parameters. This process runs in cycles until the result is acceptable or there is a break for another reason (e.g. networks with back propagation algorithm).

Unsupervised learning – there are no "required" results or specific values to achieve. This is used for finding hidden structures or clusters among inputs (unlabelled data). Networks are governed by their own rules that determine success (e.g. dispersion of data). The feed forward – the inputs bypassing are sorted among the neurons or move towards the "target" value. This process has only the forward direction. Examples of learning without a teacher are neocognitron, the Hopfield network and the Kohen network.

Methodology and research

1. Forecast of stock trends

Technical analysis is used for stock trend prediction. Namely, the method of artificial neural networks to predict share prices and trends. The reasons for its choice are described in detail in the theoretical section. The algorithm created is based on the principle of time series analysis and should demonstrate that history has a repeating tendency. The algorithm tries to predict the further development of these courses in the future from this historical data analysis. The last movements in price and the volumes of transactions are especially important. In the end, the created application will provide an answer to the question as to the most appropriate time and position for buying or selling the given financial instrument.

2. The source data and input settings

Time series are vectors (sequences) of numerical values that are sorted and indexed over time. In other words, values over time. The sampling period, which may have different values (days, hours, minutes, seconds, etc.), is extremely important to time series. For easier comprehension, these values are generally plotted in diagrams in intervals with the appropriate values.

Time series analyses on the stock exchanges are used for a better understanding of the basic principles of surrounding information relations on the given stock market. Prediction is used for future stock price development in order to increase the likelihood of gains from trading and avoid the possibility of misinterpretation or poor forecasting.

The first step is to select the input data. Relevant information is available from published market data. These issues require a dynamic representation of data and user interaction. For this purpose, a graphical user interface has been developed to use the algorithm. This entire research has been incorporated into an application. The developed application intelligently responds to user interactions. It allows many settings. If the user tries to perform unwanted steps the application warns the user and tries to adjust the error. The application has been created for universal use. The *Yahoo Finance* server is set for default stock data. Any other sources may also be used (on-line servers, off-line data).

The process is initiated by data loading. The application sets the correct URL address and attempts to establish contact with the server or include the data from the file (in the case of data file inclusion). The application notifies the user of the absence of a share title (Ticker) or the availability of data (e.g. no access to the internet, no date data (non-business days), etc.). The application notifies the user if data inclusion from the server is successful. After the data is available to the application, it may be shown on

the attached chart (the top chart in the application). Data downloaded from the server is now available on the user's computer.

Available stock data can be represented in the diagram panel. Users can choose which values they want to see and need for their work to characterize the development of stock prices. The possible default values are: the minimum price (Low), the maximum rate (High), opening rate (Open), the closing price (Close) and the adjusted close price (AdjClose). The value of the trade volume for the trading day (Volume) can also be represented if it is available. The user can use various combinations for plotting the values. The graph shows the selected values. See the section in Results for examples.

Some shares are traded on several different stock exchanges, for which reason the ticker of the financial instrument can have more than one designation (ticker name). In view of the interconnection of modern stock exchanges, the stock prices may have just small differences in prices. However, greater differences are seen in the volumes of trading which depend mostly on the size of the given stock market. If the data is loaded into the system manually (from a data file), the designation (ticker name) is irrelevant and serves only for the purposes of orientation. The application can serve for prediction for any other data that shows some interconnection among the given data.

Some shares are traded on several different stock exchanges and therefore the ticker of the financial instrument can have more indications (tickers). Because of the modern stock exchanges interconnection the exchanges rates may have just small differences in prices (in case of shares). However differences are rather in the volumes of trading which mostly depends on the size of the given stock market. If the data will be loaded into the system manually (from data file) designation (ticker name) is irrelevant and serves only for orientation purposes. The application can serve for prediction for any other data which show some interconnection among the given data.

3. Analogy of functionality

Artificial neural networks which train themselves to predict the values of learned stocks. The values of the source data were used for training. The development of this application is described in detail in the following sections.

After setting the input data and including the available source data, the application can begin to evaluate. At the start, the algorithm checks the correctness of the data. The user is informed with an appropriate error message in the case of an unexpected disagreement. However, some control values have to be set first before the learning process begins. These are:

The length of the forecast: the number of trading periods (depending on the period used in the original data set) on which the prediction will be forecast. This argument leads to a division and shift in the input data. The application creates a data structure that is used to store all data while the algorithm performs evaluation (including the original data). This assumption is made if the analysis and evaluation of the given data would also be involved in another program.

Pairing the input and target values is based on the following analogy: if the length of prediction is "A" and the number of pieces of historical data is "n", then the entries are shortened at the end with the value "A" and their number is equal to "A- n". The target values for the learning process are skipped from the beginning with the value of "A" and their number is also equal to "A- n". This shift of input and target values ensures data pairing. This data will be used in the learning process and will serve as a basis for prediction. The condition of prediction length is maximum 10 % from the range of the historical source data. This 10 % serves exclusively for the learning process. The correctly trained neural network can be used for simulation with new data for longer predictions.

The required percentage of learning success which represents the number of correctly estimated trend rate developments. The correct estimation of a trend can be increase, decrease or no change. The application automatically sets the minimum value to more than 50 %. This is used to eliminate networks that give an outcome worse than a coin toss alternative (estimated 50 % to 50 %). The maximum value to estimate would be 100 %. This would mean that the learning of the network does not stop until the neural

network achieves a correct estimation of all changes in the trend. Such a high value leads to overtraining and an overlearned network. The result would then be a network that will expect the same trends as in the past. If the input data is different from the data used during the learning process, the network will reproduce the same results on which the network was trained to predict trends and which would not conform to current trends. Therefore, when setting a higher required success value, this value is reduced to a maximum value of 99 %. *This is followed by a further criterion – the maximum number of neurons.*

The maximum number of neurons is the maximum possible number of neurons in the neural network. This parameter serves as the limit value in the learning process. When the application exceeds this number of neurons the learning process is terminated and the application returns the result of not achieving the desired criterion of success. The algorithm begins with a neural network with the lowest number of neurons. The algorithm then adjusts the parameters of the network to achieve the desired percentage of prediction success. If the algorithm cannot achieve the required percentage of success by means of any change in the network, the algorithm increases the number of neurons in the network. This process is repeated until a desired percentage of prediction success is reached or the value of the maximum number of neurons is exceeded. The default minimum value is set to 10 neurons to speed up the algorithm. A large number of neurons in the network also increases computational complexity and the use of operational memory and, most importantly, increases the duration of the overall calculation. The maximum default value of neurons is set to 1,000 to limit this endless calculation. The time needed for the calculation depends on the performance of the operational computer (it can be minutes, hours or even days).

The application performs the creation and training of the network until the required criteria are met (the required percentage of success via the learning process). If the required percentage trend forecast is obtained, the application stops the algorithm and shows the result (leaned neural network with predicted values and trends). In the case of failure, when the required criteria are not met (the maximum number of neurons being exceeded), a change can be made to the parameters and the process of network learning can be repeated.

4. Creating the neural networks and data structures

The algorithm begins the formation of the neural network by the next few steps. The very first step is to check if all the required input data exists. After a successful data search, the application reads the other input data entered by the user. If all inputs are loaded it starts the initialization of variables and creates auxiliary variables which will be used in further calculations. All these variables, source data and settings data are stored in the created final data structure where the neural network model will be included if a successful output is achieved. The following basic information is required for the algorithm for the formation of a neural network for stock value/trend prediction:

Stock prices – from which the network learns (open, high, low, volume).
Stock prices – target data which the model should achieve (next close or adj. close prices).
The required success [%] – success in the learning process at which the algorithm stops the learning process.
The maximum number of neurons – if reached, the algorithm is terminated.

As a first step all related input data is summarized into a single data structure. This large-scale data can be better represented in tables, for which reason it is left in a vertical format. Later, this data structure holds both the output data and the created artificial neural network model. The desired trends changes are calculated (increase, decrease, no change) before the creation of the network begins from the input and target values.

Matlab software from the company MATHWORKS was used for the artificial neural network. This software package includes the Neural Network Toolbox™ which was used for further calculations. A number of self-made functions had to be created for this research for automated calculations. The "NARX" type was selected for default neural network creation. The abbreviation NARX represents a model which is nonlinear (N) and auto-regression (AR) and has an exogenous element (X). When something is exogenous, this means that it is caused by an external cause and has an external origin. Exogenous elements can be any element that has influenced the output or had any relation to the

formation of the output. In the case of current share prices, basic exogenous elements are historical share price data (the older the data, the less influence they have). In this case, it is possible to use any other technical analysis indicators, the price of alternative or complementary capital market instruments or entire market economic outlooks.

A recursive approach was used in the NARX network (supervised learning). Exogenous elements are delayed from the output by one to three sample periods. The delay values change during network parameter optimization together with the various transfer functions (the algorithm looks for the possible impacts of the input on the output data). The network is made up of two main layers. The number of neurons is equally divided between these two layers. The number of neurons increases due to the learning process. The algorithm begins with the minimum number of neurons and increases the number of neurons by one after each unsuccessful training. If the division of the present number of neurons by 2 is non-integer then the number of neurons in the first layer will be rounded down and the number of neurons in the second layer rounded up. If the training is successful, the algorithm stops and returns the created network.

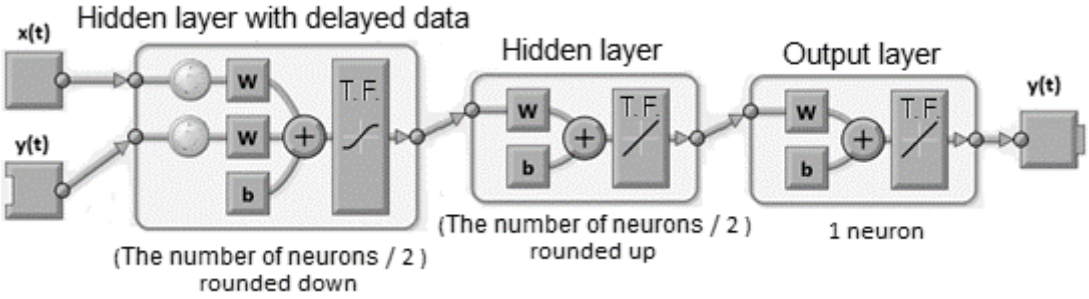

Fig. 1. A simplified graphical model of the used NARX neural network (source: the author)

5. Solving the output data and data representation

The application can simulate and predict values (according to the given settings) after successfully performing the learning process. The forecast values, along with the used data and completed neural network, are returned to the final data structure file. The trained neural network can be used for further simulations. The predicted data are shown in the given panel of the application and are also returned to the Matlab workspace and shown in the main console. Users can further decide which information they are interested in (values, trends or both). Data from the application can be easily copied and used elsewhere (e.g. in a table calculator).

The created application makes it possible to display a representative graph. Examples of such graphs are shown in Figure 2. At the top, two graphs show examples of the displaying of input data in different variations. The application also makes it possible to see the neural network training via a chart (Figure 2, bottom left). This chart shows the progress of the estimated trends as they evolve through the learning progress.

There are other possible financial indicators that can be illustrated, for example the “Bollinger bands of moving average”, to visualize volatility and relative price levels over a period of time (Fig. 2, bottom right). All the charts and graphs have a settings panel where precise settings can be performed.

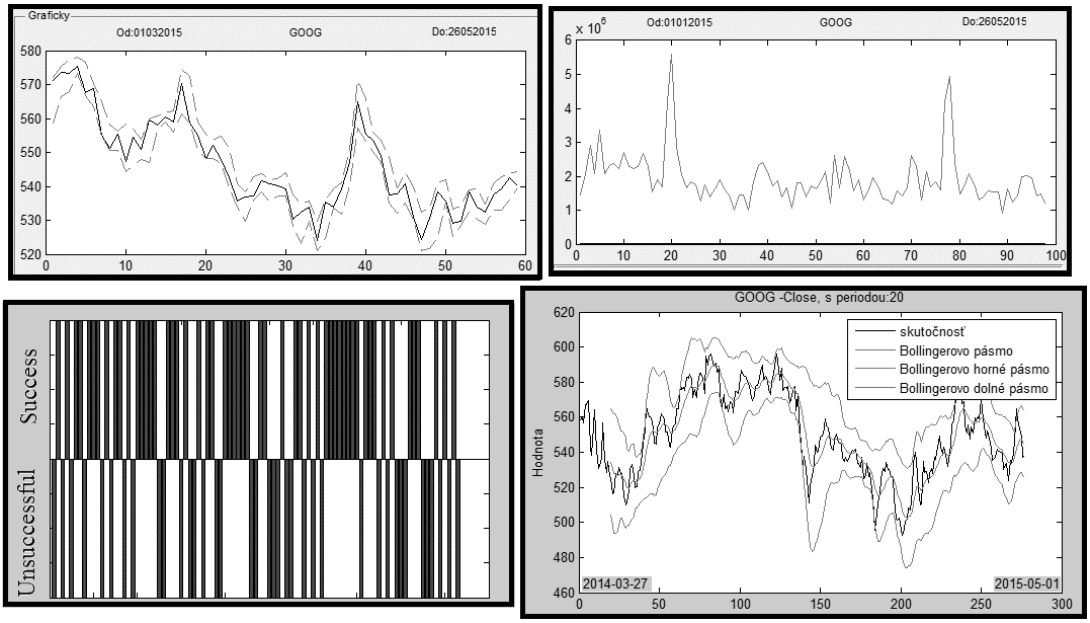

Fig. 2. Examples of representative graphs and charts (Source: the author)

Results

The output of this research is an application which makes it possible to download on-line data from a chosen server or include data from files in order to use it for prediction. Embedded data can be represented by various graphs, so the stock price development during the business day or over a longer period of time can be easily characterized. Users can choose which data they want to see, need to work with, characterize or analyse. Some calculators of financial indicators are included within the application for analysing the data.

From the selected data the application can be used for training artificial neural networks and predicting the future development of values or trends of chosen values. The application returns data in the data structure along with the trained neural network for the possibility of further use for data simulation and further analysis.

The application is designed for universal use. Intelligent adjustments help the user to use the application properly. The application is designed to eliminate possible error conditions.

1. An example of trading by using predicted trends

This section simulates an example of the buying and selling of one Google share on NASDAQ stock market. It serves as a prime example of the functionality of the proposed application by using predicted values from a trained neural network model. The used network was trained with stock prices data from 01/01/2015 to 01/05/2015. The required percentage of learning success was set to 90 percent. The created neural network was then used to simulate and predict the adjusted close price of the given shares for the next trading day. The table below summarizes and compares the actual and predicted share prices. In this case, 11 out of 16 trends were predicted correctly (69 %), with 5 trends predicted incorrectly (31 %).

The predicted trends were used to decide whether to buy or sell the given share. Spot purchases and sales were assumed during trading. This trade also assumed that the trader already has one share purchased. The share was sold and bought according to the most favourable forecasts. Trading simulation of 16 trading days came out positive $ 23.3 (the share remained). Transaction costs were not taken into account. These costs should be offset by a higher volume of share units sold and purchased.

Table 1: Sample of trading calculations

ID	Date	Real price [$]	Trend	Predicted price	Trend	Match	Buy [$]	Sell [$]
1	1.5.2015	537.90	↓	-	↓	-	-	-

2. General success assessment of the generated prediction models

Overall, 2,070 cases were simulated, of which around two thirds (1,328 cases, 64 % of total) were successfully indicated. All calculations were performed on real stock data. Simulations were accompanied by simplified trading with one share which mostly ended in a profit. The created models recognize essential change rates and benefited from them. Large errors were caused by long-term prediction. Because they represent a greater number (length of prediction), their weight in the overall assessment deteriorates the overall final result of the correct predictions. Trained models knew "correct" predictions in the short-term within several periods. They can be used with new data for simulation, but had to be newly trained to predict correctly in the long-term.

Conclusion and discussion

The output of this research is an application that includes a developed algorithm. This algorithm creates artificial neural network models to learn historical stock data (from source data) to predict the future trends and prices of the learned stocks. The created models were tested on real stock data. More than 2,000 prediction examples were simulated. The overall success ratio for trend prediction was around 64 %. Long-term predictions distorted the final result. The output of models was used for trading which was of a profitable nature. The type of neural network developed achieved good generalized patterns and relations that appear in price movements and can be used as a prediction system.

In order to be user-friendly, a graphical user interface was developed in Matlab. As to the legislation: it is not illegal in the European Union to use such sophisticated algorithms for trading-decision support (Smejkal, 2015).

When using the applications for real trading, it is necessary to take the fees charged for individual trades into account. The relative importance of fees decreases with higher trading volume. For this reason it is necessary to consider whether the stocks will be traded in large enough volumes when the amount of stock sell and buy price difference is higher than the price of the trading fee before using the model for trading.

Further development of the networks could involve the addition of new optimized layers. It is necessary to understand that "big" networks or the use of long time series increases computational complexity and, therefore, the overall execution time. Application innovation could result in a newer version that would include more types of neural networks (the application was designed with the possibility of extension from the very beginning). These end results of created networks could then be compared with each other and the most suitable one chosen for a given instrument. The selected network should be the one that would most accurately predict the financial instrument. In this new version, an optimization algorithm would have to be used to spare computing time (using genetic algorithms and evolution strategies). All these changes would have to be made within the application code.

This paper is part of a larger piece of research in which methods of artificial intelligence are used for effective or automated trading systems on the financial markets.

Abstract

Risk assessment is a demanding process of information security risk management. Organizations often do not employ sufficiently experienced and qualified employees in handling information security risks. This paper focuses on a fuzzy logic application in the process of information security risk assessment based on a matrix method of the ISO/IEC 27005 standard and regulations according to the Cyber Security Regulation No. 316/2014 introduced in the Czech Republic. The method and the regulations are combined to form a risk assessment matrix which is processed in the QtFuzzyLite software. The result is a fuzzy logic system designed for organizations that need to simplify and specify risk assessment where likelihood of threat occurrence, threat consequence value and asset vulnerability level are vague and difficult to estimate. These variables directly affect the information security risk value. The paper discusses the possibility of utilizing the fuzzy logic system as a decision support tool in Slovak organizations.

Keywords: Risk assessment, fuzzy logic, information security, threat.

Introduction

Information is an asset that needs to be suitably protected in organizations. That is especially important in the increasingly interconnected business environment (Said, Abdullah and Mohamed, 2013). Organizations encounter information security risks more often as information and communication technologies (ICT) progress. Due to the expansion of the Internet, organizations are easier to attack on the information assets (Huo, Meng and Chen, 2015). Information assets (e.g. information, software, hardware, business secrets, knowledge, and financial data) are crucial to create business added value. The theft or any change of such assets leads to loss of credibility, competitiveness and know-how. The most important data is stored in information systems (IS). For this reason, information systems are frequently exposed to various types of threats which can cause different types of damages that might lead to significant financial losses (Jouini, Rabai nad Aissa, 2014).

Implementation of information security risk management (ISRM) leads to a protection of organizations' ICT and IS at the adequate level. Risk management perceives risk as a combination of the likelihood of threat occurrence and the associated consequences that affect organization's information assets, which are vulnerable. These variables are involved in the process of risk assessment. The ISO/IEC 27000 (2014) standard defines risk assessment as the overall process of risk identification, risk analysis and risk evaluation. By assessing the risks which might cause irretrievable damages, organizations receive a comprehensive overview of the individual risk values.

Risk assessment is a demanding process that is not always definite. Determining values of likelihood of threats and their consequences requires a qualified estimate. Organizations rarely employ sufficiently experienced and qualified personnel (Bolek, 2013) and often do not have enough time to assess risks. The process of risk assessment may be facilitated by the use of fuzzy logic (Doskočil, 2016; Lee, 2014; Yang and Zhou, 2012) that determines how much an element belongs to the set or not (Dostál, 2011). Application of fuzzy logic assists employees to determine the risk value in the case of vague assessment

of input variables. Another possibility to improve the quality level of risk assessment is to promote continual trainings in the field of information security (Bolek, 2015).

Currently, lack of qualified and experienced personnel in information security is the issue of Czech organizations. In 2014, the Czech Republic adopted the Act on Cyber Security No. 181/2014. The act obliges the Czech organizations, which are administrators of information or communication systems of critical information infrastructure and administrators of important information systems, to manage and assess risks (Act on Cyber Security, 2014) based on a methodology proposed by the Cyber Security Regulation No. 316/2014. Slovak organizations also deal with information security risks, but miss a legal definition so far. Similarities between the environments of both countries indicate that the methodology and the fuzzy logic system may be applicable in Slovak organizations as well.

The paper focuses on a fuzzy logic application in the process of information security risk assessment using a matrix with predefined values method of the ISO/IEC 27005 standard and regulations according to the Czech Cyber Security Regulation No. 316/2014 in the software environment of QtFuzzyLite (Rada-Vilela, 2013). A designed tool serves the organizations affected by the Act on Cyber Security. However, because the tool is not directly linked to the law, it may be used in all organizations that need to simplify the risk assessment in cases where the values of threat, consequences and asset vulnerabilities cannot be precisely determined.

Literature Review

A family of ISO/IEC 27000 standards (2014) considers information security as a preservation of confidentiality, integrity and availability of information. From a different point of view, information security is the process of protecting information and information infrastructure from unauthorized access that results in disclosure, modification or destruction of information, and modification or disruption of information technology services (Ng, Ahmad and Maynard, 2013; Al Amro, Chiclana and Elizondo, 2012). Previously, information security issues were treated by technological solutions (Singh, A.N. et al., 2013). However, growing security needs have extended organizations' attention to explore the management role in information security (Soomro, Shah and Ahmed, 2016; Siponen, Mahmood and Pahnila, 2014).

While the significance of risk management is growing in the process of globalization, businesses learn to accept risks not just passively, but perceive the risks as an opportunity to improve their prosperity (Beňová, 2015; Butoracová-Šindlerová and Butorac, 2008). ISRM, which is now becoming a crucial component of good corporate governance, is a discipline responsible for protecting organizations' information assets against security risks (von Solms and von Solms, 2005). According to ISO/IEC 27005 (2011), ISRM is a continual process that establishes the context, assesses the risks and treats the risks using a risk treatment plan to implement the recommendations and decisions. Organizations willing to reach an adequate level of security must be able to identify security holes and develop a mechanism to prevent any misuse thereof (Alsaif, Aljaafari and Khan, 2015). Frequent assessment and treatment of the information security risks lead organizations to eliminate or reduce their likelihood or impact to a minimum (Farahmand et al., 2005).

The essential risk assessment activity is the process of estimation. Information used to estimate values of threat, consequence and vulnerability usually comes from (ISACA, 2015):

- Past experience or data and records,
- Market research and analysis,
- Reliable practices, guidelines or standards,
- Experiments,
- Economic and engineering models,
- Specialist advice.

Information security risk assessment process includes preparation of risk assessment, asset identification, threat identification, vulnerability identification, and risk calculation and other stages (Lee, 2014; Yang and Zhou, 2012). It is up to the organization to select its own approach based on the objectives and the

aim of the risk assessment (ISO/IEC 27005, 2011). In our case, the base for the fuzzy logic system design is the Czech Act on Cyber Security and the corresponding regulation, because they precisely define the process of risk assessment for the organizations concerned. Compliance with these regulations has become a model of good practice for other organizations. Combined with the risk assessment matrix method according to ISO/IEC 27005 (2011), a good quality basis for designing a fuzzy logic controller is introduced.

The application of fuzzy logic (Doskočil and Doubravský, 2015; Dotcenko, Vladyko, and Letenko, 2014, Aydın and Chouseinoglou, 2013, Singh, H. et al., 2013; Posoldová and Oravec, 2013) is based on the fuzzy set theory (Zimmermann, 2001). The fuzzy set is a set whose elements have degrees of membership (Doskočil and Doubravský, 2013; Dostál, 2011). By means of fuzzy logic it is possible to find the solution of given task from rules, which were defined for analogous tasks (Doskočil, 2016). The system design using the fuzzy logic consists of three basic components: fuzzification, fuzzy inference and defuzzification. The fuzzification involves transforming real variables into linguistic variables. The next step is to define the behavior of system by the rules of the following type: <If> Input_A <And> Input_B <And> ... <And> Input_X <Then> Output_1. By creating the rules, conditional sentences that evaluate the state of relevant variables are formed. The results of the fuzzy inference are numerical values. The defuzzification transfers the results into linguistic values of output variables. The results are described verbally. The fuzzy logic is a useful method when dealing with vague sets and logic (Dostál, 2011).

Objectives and Methodology

The main objective of the paper is to design the fuzzy logic application that evaluates information security risks as defined by the Czech Act on Cyber Security. The output of the application is the fuzzy logic system (controller) that is able to determine the measure of information security risk after the expert evaluation and inputting the values of threat likelihood, threat consequence and asset vulnerability level of the organization. Such system is useful in all types of organizations that need to manage information security risks. Employees, who are responsible for risk assessment, receive the effective tool to support decision-making process in the risk analysis.

The main scientific objective is supported by several partial objectives:

- To evaluate the possibility of applying the fuzzy logic in the process of assessing the level of information security risks,
- To design the effective decision-making tool for organizations that want to simplify the evaluation of risks where values of threat, consequence and vulnerability are difficult to estimate,
- To create the fuzzy logic controller applied on the selected methods in the QtFuzzyLite software.

When processing the studied issue, current domestic and foreign scientific studies, information sources and international standards and guidelines are used to achieve the objectives. Analysis, comparison and synthesis of theoretical background lead to specific results of the issue. In Figure 1, a research model shows a procedure to construct the fuzzy logic application for information security risk assessment.

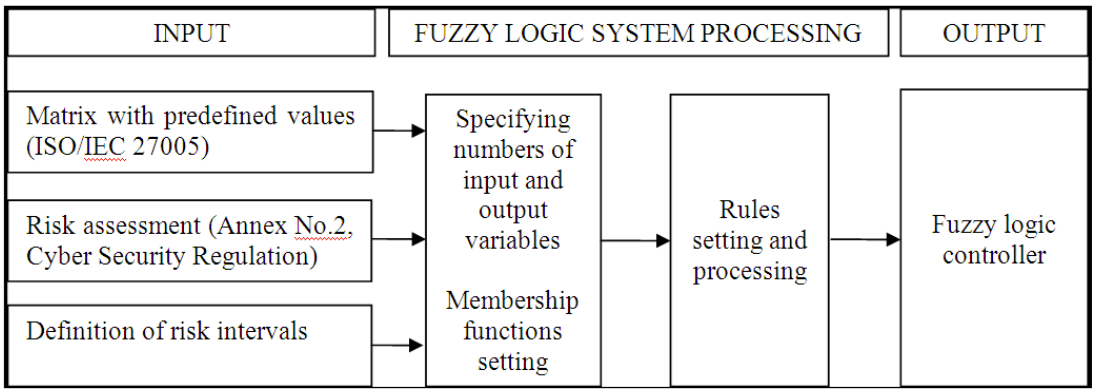

Fig. 1: Research model (Source: Authors´ own)

The matrix method with predefined values according to ISO/IEC 27005 is the input into the system. It is extended and modified by the approach of Czech Cyber Security Regulation. The regulation divides likelihood of threat, consequence value, vulnerability value and risk value into a scale of four levels: low, medium, high and critical. Each level is characterized by specific parameters of threat, consequence, vulnerability and risk identification and evaluation. Table 1 contains a simplified description of the scale.

Table 1: Scale of threat, consequence, vulnerability and risk evaluation (Source: Cyber Security Regulation, 2014)

Threat evaluation scale	**Description**
Low	• Threat does not exist or is unlikely. • Threat occurrence is not more than once every five years.
Medium	• Threat is less likely to occur. • Threat occurrence ranges from 1 to 5 years.
High	• Threat is likely to occur. • Threat occurrence ranges from 1 month to 1 year.
Critical	• Threat is most likely or certain to occur. • Threat occurrence is more frequent than once a month.
Consequence evaluation scale	**Description**
Low	• Consequence of a small extent for a limited period of time, not catastrophic.
Medium	• Consequence of a limited extent for a limited period of time.
High	• Consequence of a limited extent, but permanent or catastrophic.
Critical	• Consequence of a large extent, permanent and catastrophic.
Asset vulnerability evaluation scale	**Description**
Low	• Vulnerability does not exist or is unlikely. • High-quality security controls with early detection of possible weaknesses a attempts to overcome controls.
Medium	• Vulnerability is less likely to occur. • Quality security measures whose effectiveness is regularly inspected.
High	• Vulnerability is likely to occur. • Security controls exist, but their effectiveness does not cover all necessa aspects.
Critical	• Vulnerability is most likely to occur, abuse is almost certain. • Security controls are not implemented or their effectiveness is limited.
Risk evaluation scale	**Description**

Low	• Risk is acceptable.
Medium	• Risk can be reduced by less advanced controls. • Risk is acceptable in case of more advanced controls.
High	• Risk is unacceptable in the long term. • Systematic steps to risk treatment must be initiated.
Critical	• Risk is unacceptable. • Steps to risk treatment must be immediately initiated.

Individual threats, vulnerabilities and consequences need to be inserted into appropriate levels of scale as described in Table 1. However, identification and evaluation of inputs to the risk assessment may be difficult because it depends on knowledge and experience of the expert worker. The fuzzy logic assists to eliminate imprecision.

Table 2: Scale of input variables (Source: Cyber Security Regulation, 2014)

Threat or Consequence or Vulnerability	Low	Medium	High	Critical
Value	1	2	3	4

The levels of scale from Low to Critical are converted to values from 1 to 4 (Table 2), so that the calculation of risk value according to the following equation based on the Cyber Security Regulation (2014) may be applied:

$$\text{Risk} = \text{Threat} \times \text{Consequence} \times \text{Vulnerability} \qquad (1)$$

Definition of intervals to assess risks follows. Three variables (threat, consequence, vulnerability) enter the equation; their maximum value is 4. If all values of variables reach their maxima, the level of risk receives a maximum value of 64. In this case, the risk is considered critical. According to our preferences, the measure of risk is divided into four intervals with uniform ranges (Table 3). In various organizations, intervals can be determined differently based on experience, knowledge and expert estimation of responsible employees. The expert determines such intervals that best meet the current objectives of the organization.

Table 3: Risk intervals (Source: Authors' own)

Risk	Low	Medium	High	Critical
Interval of values	<1 - 16)	<16 - 32)	<32 - 48)	<48 - 64)

Table 4 shows the modified and extended risk assessment matrix in accordance with ISO/IEC 27005, which is adapted to the Czech Cyber Security Regulation for the affected organizations. In the matrix, the risk values are calculated using the provided equation. The risk values are highlighted according to their significance from Low to Critical. The adjusted risk assessment matrix is the input to the fuzzy logic system processing.

Table 4: Risk assessment matrix (Source: Authors´ own elaboration based on Cyber Security Regulation, 2014; ISO/IEC 27005, 2011)

Likelihood of threat occurren		**1**				**2**				**3**				**4**			
Consequence value		**1**	**2**	**3**	**4**	**1**	**2**	**3**	**4**	**1**	**2**	**3**	**4**	**1**	**2**	**3**	**4**
Vul abi lev	**1**	1	2	3	4	2	4	6	8	3	6	9	12	4	8	12	16

	2	2	4	6	8	4	8	12	16	6	12	18	24	8	16	24	32
	3	3	6	9	12	6	12	18	24	9	18	27	36	12	24	36	48
	4	4	8	12	16	8	16	24	32	12	24	36	48	16	32	48	64

The fuzzy logic system was processed in the open-source software QtFuzzyLite, which was selected because of quick response, availability, simple system designing and no expenses (Rada-Vilela, 2013). The program becomes a respected competitor of sophisticated software, e.g. MATLAB - Fuzzy Logic Toolbox and fuzzyTECH. In the program, three variable inputs are defined – Threat, Consequence, Vulnerability and one output variable – Risk. Parameters of membership functions (MF) of individual inputs and the output are set according to the selected methodology (Figure 2). For the purposes of the system, triangular shapes of MFs are sufficient. Vertices of variables' MFs represent the maximal confidence of the expert that the variable belongs to the specific level from Low for Critical. MFs' setting for all input variables is identical due to the same definition of input variables' scale. MF of the output variable copies the extreme values of risk intervals.

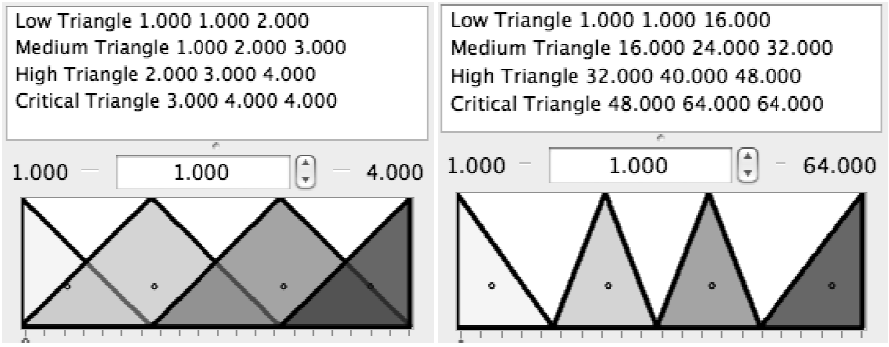

Fig. 2: Membership functions' settings for input (left) and output (right) variables (Source: Authors' own)

Subsequently, the rules determine which combination of inputs leads to the specific output. It is the expert system, which specifies that each combination of variables entering into the system and occurring in a condition of <If> <Then> represents one rule. In the designed system, 64 rules that correspond to the values in Table 4 are set. The rules have the following syntax in the software interface: <if Threat is "a" and Consequence is „b" and Vulnerability is „c" then Risk is „d">, where a, b, c and d are the linguistic variable values from Low to Critical. After the rule definition and setting, the fuzzy logic controller was designed, i.e. the fuzzy logic system that determines the output value in real time based on given inputs.

Results and Discussion

In terms of the fuzzy logic terminology, the result is a fuzzy inference system (FIS) that transforms input variables into the output. A selected type of FIS is Mamdani, which is more widely used, because it provides good results with a relatively simple structure, and due to the intuitive and interpretable nature of the rule base (Jassbi et al., 2006). In the designed system, the value of information security risk is calculated after entering the likelihood of threat occurrence, the threat consequence value and the level of organization's information asset vulnerability. The resulting system is shown in Figure 3.

Fig. 3: Fuzzy inference system (Source: Authors' own)

Application of the fuzzy logic in QtFuzzyLite enables to obtain results of risk values based on the input values of variables in thousandths (1.000 – 4.000). If the employee responsible for the risk assessment cannot assign the exact value to threat, vulnerability and consequence variables, variable values closest to the given set can be inputted. Impossibility of inputting extreme values of variables to the system (1.000 or 4.000) is its limitation. Within defuzzification, values of the output variable are converted to verbal values that represent understandable results of fuzzy calculation. Table 5 shows a comparison of several fuzzy logic system's outputs with the matrix method results.

Table 5: Comparison of results (Source: Authors' own)

	Threat	Consequence	Vulnerability	Results (Value)	Results (Risk
Fuzzy logic controll	2.000	3.000	3.000	24.000	Medium
	3.999	3.999	3.000	58.560	Critical
	3.000	1.001	2.000	6.000	Low
	2.000	3.999	3.999	39.968	High
Risk assessment matrix method	2	3	3	18	Medium
	4	4	3	48	Critical
	3	1	2	6	Low
	2	4	4	32	High

Numerical expressions are different because the system takes shapes and ranges of MFs, accuracy of rules, a defuzzifier method and other parameters into calculation. However, verbal expressions are accurate. Furthermore, because the system allows to input other values then integers, it is possible to obtain much wider range of risk values. Subsequently, they express the degree of risk membership in the set, i.e. in the defined interval. Such system provides new opportunities for variables that cannot be clearly assessed. The limitation of the system is that the shapes of MFs might not accordingly express the threat, consequence and vulnerability scales, which might result in the risk value distortion. The shapes of the system's MFs are considered to be further investigated in order to increase the risk value accuracy.

The designed fuzzy logic controller may be implemented in Czech organizations that are obliged to follow the Act and the Regulation on Cyber Security, as the system is directly based on the regulations. However, the system is generally applicable to all organizations that use risk management focusing on information security due to its simple usage, fast calculation of risk value and a possibility of inputting a wider range of variable values without a need for their exact inclusion in the defined scale from Low to Critical. A part of variable attributes might in fact meet the criteria of lower or upper level of the scale.

The above mentioned advantages together with the legal environment similarity enable the use of the designed system in Slovak organizations that are not currently affected by any related legal standard, but need to deal with information security risks. Many international standards and guidelines leave organizations to choose freely between the risk analysis methods and allow to adapt them. Therefore, the suggested fuzzy logic system already provides a comprehensive tool for immediate usage in the risk evaluation process and assists to achieve stable results of the risk assessment. Consequently, the final FIS is the appropriate decision-support tool for employees responsible for ISRM both in Slovak and Czech organizations.

After using the suggested system, the risk assessment results need to be evaluated in terms of organization's mission, risk tolerance, budgets and cost of mitigation. Based on this evaluation, a mitigation strategy can be chosen for each risk and appropriate controls can be designed and implemented. The results can also be used to (ISACA, 2015):

- Communicate the risk decisions and expectations of management throughout the organization,
- Identify areas where incident response capabilities need to be developed to quickly detect and respond to inherent or residual risk or where security controls cannot adequately address the threat.

Conclusion

The fuzzy logic is advanced method to support decisions. As a consequence of the fuzzy logic, it is possible to resolve a number of issues that arise in business management, public administration, and other organizations or institutions. The results of the applied fuzzy logic present fast and accurate outputs in the area, where decisions are vague and difficult. This is the case of information security risk assessment, where likelihood of threat occurrence, threat consequence value and assess vulnerability level cannot always be precisely determined. Variable evaluation requires qualified and experienced personnel. The designed system based on the application of the fuzzy logic in the process of information security risk assessment using recommendations of ISO/IEC 27005 and regulations of the Czech Cyber Security Regulation No. 316/2014 simplifies to determine the values of individual risks when the values of input variables are difficult and vague to estimate. The system is an effective tool to support decisions in the process of information security risk assessment in organizations.

Abstract

Increasing informatisation of the society and the introduction of information technologies increases the level of dependence of organisations on information technologies. Currently, it is difficult to find business processes/activities, which are not in any way dependent on technologies. Dependence has reached such a level that virtually no organization can work effectively without access to IT. Implementation of information systems, their development and maintenance can significantly help to achieve sustainable competitive advantage of an organization. IT Governance as an integral part of organizational management at the highest level supports effective management of information resources to promote the achievement of strategic objectives of the organization. The size of a company has, among other things, a significant impact on selected areas of strategic alignment of IS/IT with business activities. The results of a research conducted in Slovakia at 363 enterprises deepen and expand the knowledge of strategic alignment of IT with business activities and examine the significant difference in strategic alignment of IT with business activities among enterprises of different sizes.

Keywords: IT Governance, strategy, business activities, IT management.

Introduction

The emergence of new technological breakthroughs in the field of IS/IT has brought not only new opportunities for strategic technologies, but it has also made numerous benefits more accessible for companies and organisations (Galliers and Leidner, 2003). Although many organisations understand the need to exercise some form of control over the area of IS/IT, a vast majority of organisations have not yet attained a sufficient control of this area (Hardy, 2006). In terms of utilisation of strategic technologies and control over IS/IT, support for organisation management is also important in the area of business continuity management (Filanová, 2015). Effective and efficient use of IS/IT needs to be aligned with business strategies thus ensuring stable and continuous support and increase in competitiveness of a company (Jorf, Norwegian and Najjar, 2011). Despite the fact that effective investments in IS/IT and their strategic use are based on systematic links between legitimate decision-making processes and a strategy, many businesses realise the importance of information assets and IS/IT infrastructure and recognise the importance of decision-making processes associated with IT Governance (Van Grembergen et al., 2004; Posthumus and Solms, 2005). IT Governance is seen as a set of relationships, processes, policies that help manage the organization so as to maximize the IT support for its strategic objectives.

The aim of the research carried out in the Slovak Republic was to deepen and broaden the knowledge of the strategic alignment of IT with business activities and identify the relationship/link between the area of strategic alignment of IT with a business and a company size measured by the number of employees in the Slovak Republic.

Theoretical background

The definition of IT Governance, which was conceived up by Rose and Weil, is accepted by most authors and considered to be the starting point in their work. They define IT governance as "a decision-making framework of rights and responsibilities to encourage desirable behaviour in the use of IS/IT." (Weill and Ross, 2004)

The increasing amount of work on IT Governance points out that there is no single agreed definition of IT governance, but that the stated definitions differ in various aspects. Webb, Pollard and Ridley use content analysis to integrate the diversity that is reflected in many definitions of IT Governance and define it as follows: IT Governance represents strategic alignment of IS/IT with business in order to achieve the maximum value through development and maintaining an effective control, accountability, performance management and risk management in the area of IS/IT. (Webb, Pollard and Ridley, 2006).

Similarly, R. Butler and M.J. Butler originated from the definition of Weil and Ross in constructing a framework for IT Governance, which considers the following three elements to be the most important: processes, structures and relational mechanisms that also appear in the works of other authors (Symons, 2005; Larsen et al., 2006; De Haes and Van Grembergen, 2008; Butler and Butler, 2010).

According to Wilson and Pollard (2009) the elements of IT Governance are: structures and processes, supplemented by control frameworks, which they regard as essential tools for application, implementation and development of IT Governance.

Authors often deal mainly with descriptions and categorisation of existing or proposed structures for IT Governance, including Peterson et al., Weil and Ross (Peterson, Parker and Ribbers, 2002; Weill and Ross, 2004; Willson and Pollard, 2009).

Another group of authors views IT Governance and its objectives through the so-called focus areas of IT Governance. The comparison of several opinions, for example also on IT Governance objectives, translates into the IT Governance focus areas, namely Strategic Alignment, Resource Management, Risk Management, Value Delivery, Performance Management (ITGI, 2003; Hardy, 2003; Kordel, 2004; Chun, 2005; Symons, 2005; Brisebois, Boyd and Shadid 2010, ISACA, 2012). Butler and Butler (2010) are inclined to this opinion and regard such focus areas as widely recognised.

View of various authors on the basic focus areas of IT Governance differ in some respects. The literature reveals a broader scope for IT governance that is commonly associated with corporate governance or SISP, and includes the following facets: Strategic alignment, Risk Management, Performance Management, Capability Management, Control and Accountability, and Delivery of business value through IT (Wilson and Pollard, 2009).

A summary of these aspects is substantiated in reference to other authors who have researched the area of interests of IT Governance. The concept of five aspects of IT Governance was researched, for instance, by Gellings in this specification: Strategic Alignment between the business and IT, Risk Management, Performance Management, Control and Accountability, Delivery of Business Value, Capability management (Gellings, 2007).

The most significant and comprehensive study dealing with the solution of the focus areas of IT Governance is considered to be the study by Wilkin and Chenchala (2010), which was published in 2010, called "A Review of IT Governance: A Taxonomy to Inform Accounting Information Systems“.

A persistent problem both in the area of research and practice of IS/IT is considered by the authors to be maximizing the potential of IS/IT. Therefore, they acknowledge the ITGI's claim that the role of IT Governance is to ensure the effective use of IS/IT with the focus on Strategic Alignment, Risk Management, Resource Management, Value Delivery and Performance Measurement (ITGI, 2008).

The authors of the study identified 496 articles in the period from 1998 to 2008 dealing with the area of IT Governance. They documented the progress in the understanding of the area of IT Governance, which is, however, characterised by fragmentation with very low integration of the IT Governance focus areas. The aim of this study was not to examine all the documents related to the research of IT Governance but to capture the essence of the research and propose other research options for the future (Wilkin and Chenhall, 2010). The research included all 5 areas of IT Governance. Most attention in the reviewed articles focused on the area of strategic alignment (31%).

Strategic alignment is not considered a new concept, but it is useful in aligning IS/IT and corporate strategy (Ward and Peppard, 2002). For businesses, it is important to implement strategic alignment in order to achieve a sustainable competitive advantage. According to Reich and Benbasat, strategic alignment is defined as "the extent to which the mission, goals and objectives of IS/IT support and are supported by the company mission, the company objectives and plans" (Reich and Benbasat, 2000).

Strategic realignment aims to provide the connection between the business and the plans of IS/IT, designation, maintenance and verification of the value propositions of IS/IT, and harmonisation of activities in the area of IS/IT with the business processes (ITGI, 2007).

As such, strategic alignment should address the direction for other ITG focus areas with a business value delivered through effective investment and planning including tactical plans for risk management and resource management. This would deliver business value as informed by coordinated performance measurement. (Wilkin and Chenhall, 2010)

Research framework and methodology

The goal was to deepen and broaden the knowledge regarding the strategic alignment of IT with business activities, based on the foreign and domestic literature, in order to identify the current state of knowledge in this area, with subsequent comparison and synthesis of acquired knowledge as well as the review of strategic alignment of IT with business based on data and information obtained by a questionnaire survey at Slovak enterprises.

Research instrument

Implemented research studies have identified a number of factors affecting the IT Governance framework. Works that can be considered as primary and underlying, even before the emergence of the concept of IT governance, addressed many factors and their links to the area of corporate IS/IT. Based on the theoretical basis and the implemented research projects, partial objective were defined. One of the milestones of the research, the solution of which is presented by this article, is to analyse the impact of a company size measured by the number of employees on the area of strategic alignment of IT with the business.

When drawing up the questions of the questionnaire survey, in addition to the standard classification of questions as open and closed, two basic approaches were chosen, namely the specification of a value judgement on the basis of the Likert scale (in the sections of the strategic alignment of IS/IT with business activities - Table 1, the support of business performance through IS/IT, IT Governance inhibitors) and the selection from possible answers (e.g. the organizational structure and the position of IS/IT, the methodology of IS/IT administration and management, management of IS/IT services). In applying the Likert scales the following steps of the evaluation opinion were used - strongly agree, somewhat agree, somewhat disagree, completely disagree and other, or not specified opinion. Variables were measured by respondents' expressed opinion on the scale of 1 (completely disagree) to 5 (strongly agree).

The research applied general theoretical methods - analysis, synthesis, induction, deduction, comparison, analogy, generalisation; specific methods - questionnaire survey, mathematical-statistical and analytical-logical methods; empirical methods, in particular observation. The normality of data distribution was tested by the Leven test. When further analysing the data with normal distribution, we used Anova with

Bonferroni correction. For data that does not qualify for normality distribution of data, we used the Kruskal-Wallis test; with the variable SA1 we applied the Chi-square test.

Table 1: Researched variables (Source: Authors´ own)

SA	**Strategic alignment of IS/IT with business activities**	**SA**	**Strategic alignment of IS/IT with business activities**
SA1	IS/IT strategy	SA12	Documenting of business processes
SA2	Alignment of the IS/IT strategy with the company strategy	SA13	Definition of links between IS/IT and busine processes
SA3	IS/IT as one of the strategic company objectives	SA14	Quality, documentation and monitoring of IS/IT services
SA4	IS/ IT as a strategic business resource	SA15	Link between success in business activities a their support for IS/IT
SA5	IS/IT as business support	SA16	Indicators to determine the benefits of IS/IT
SA6	IS / IT as means for achieving other objectives of the company	SA17	Regular evaluation of IS/IT return on investment
SA7	IS/IT as a tool of support processes	SA18	Efficiency of investments in IS/IT
SA8	Integrating staff into IS/IT projects	SA19	The level of knowledge of IS/IT staff of the IS/IT department
SA9	Specification of project priorities	SA20	The level of knowledge of IS/IT users
SA10	Integration of IS/IT applications	SA21	Relations between the IS/IT unit and its suppliers
SA11	Documentation of IS/IT processes	SA22	Barriers to connecting IS/IT with business

The research sample included 363 enterprises with the largest share of small and medium-sized enterprises, while the small enterprises accounted for the share of 31.40% and the medium for 29.48%. The share of large enterprises was 22.87% and micro-enterprises 16.25%. In terms of sector coverage, the most represented were: industrial production14.33%, information and communication 13.50%; wholesale and retail; repair of motor vehicles and motorcycles 12.12%. The share of the enterprises in terms of geography: the highest share solely in the Slovak Republic 37.47% and 23.14% in Europe; the lowest share only in Slovakia and the Czech Republic, namely 9.92%; and only in a certain region of the Slovak Republic 10.74%. The structure of the surveyed sample according to the IS/IT customer or the IS/IT contractor is the following: 71 percent of IS/IT customers from the business area, 23 percent of contractors of IS/IT products and services.

Results and discussion

In the first part of the evaluation, which translates into graphical outputs and in the area of management of IS/IT services into table outputs, in case of individual variables according to an established model, we included only the results representing a favorable opinion, while a favorable opinion is considered the answers strongly agree and somewhat agree. The values in graphs are defined by the ratio of the favorable opinion within a given group.

The second part of the research includes all the data and focuses especially on the statistical verification of a significant difference of individual variables (Table 1) affected by a relevant factor, while it originates from the partial results from the first part.

The evaluation is broken down by areas examined in accordance with the structure of the established research model and the research hypothesis.

The displayed results (Figure 1) can be used to identify the biggest difference in values, according to the company size, in case of the variable SA1 IS/IT Strategy and SA2 Alignment of the IS/IT strategy with the company strategy, which follows and builds on the variable SA1.

The values of the SA1 achieved are gradually differentiated in various size categories - large enterprises 83% (l), medium 59% (m), small 40% (s) and micro 27% (mi). Other significant differences between the categories of large and micro enterprises were recorded in the following variables:
SA11 Documenting of IS/IT processes (l - 80%, mi - 42%),
SA12 Documenting of business processes (l - 89%, mi - 51 %),
SA13 Definition of links between IS/IT and business processes (l - 71%; mi - 49%),
SA14 Quality, documenting and monitoring of IS/IT services (l - 75%; mi - 31%),
SA17 Regular evaluation of the return on investment in IS/IT (l - 52%; mi - 29%).
The differences in the values of the variables range from 22% to 44%.

Minimum differences were observed in the following variables:
SA4 IS/IT as a strategic business resource (l - 83%; mi - 78 %),
SA6 IS/IT as means for achieving other objectives of the company (l - 76%; mi - 69%),
SA7 IS/IT as a tool of support processes (l - 64%; mi - 62%),
SA8 Integrating staff into IS/IT projects (l - 75%; mi - 69%),
SA18 Efficiency of investments in IS/IT (l - 81%; mi - 85%; with a higher ratio of micro businesses),
SA20 Level of knowledge of IS/IT users (l - 87%; mi - 86%).

Verification of statistical significance

The variables were subjected to verification of the significance of the impact of the company size on the area under consideration. All tests were performed at a significance level of p = 0.05.

Table 2: Results of testing the statistical significance of strategic alignment of IS/IT with business activities depending on the company size (Source: Authors´ own)

SA22	0.5	0.6	0.1	0.9	-	-	-	No

From the aforesaid assumptions, the statistical verification of partial results of the implemented research confirmed a significant difference depending on the company size in the conditions of the Slovak Republic in the following variables (Table 2): SA1 IS/IT Strategy, SA2 Alignment of the IS/IT strategy with the company strategy, SA11 Documenting of IS/IT processes, SA12 Documenting of business processes, SA13 Definition of links between IS/IT and business processes, SA14 Quality, documenting and monitoring of IS/IT services, SA17 Regular evaluation of the return on investment in IS/IT. At the same time, a significant difference was confirmed in the variables SA10 Integration of IS/IT applications and SA19 Level of knowledge of IS/IT staff of the IS/IT department.

Wilkin and Chenchall (2010), who analyzed strategic alignment through 7 key aspects such as 1) Understanding the concepts of strategy and alignment; 2) Properties of IS/IT strategy and alignment; 3) Design of IS/IT strategy; 4) The role of the Board of Directors- the role of the Board in Governance; 5) The role of the CEO and the CIO to maximize the benefits of strategic alignment; 6) Alternatives to strategic alignment; 7) The linkage between strategic realignment and value creation. They conclude from their research that SA is a motivator for ITG (PWC, 2006) ensuring linkage of business, IT plans, and operations through establishing, ensuring, and evaluating IT value. Hence, SA research should go beyond the issues raised in SA1–7 and include holistic research into strategic issues like decision rights and responsibilities, policies for risk metrics, reporting requirements to ensure continuous value delivery, and oversight of controls. Thus, a number of these issues relate to the other four focus areas, highlighting the value of research exploring these linkages.

Other studies did not demonstrate for example a significant relationship between the size of the company and the design of an IT Governance model (Olson and Chervany, 1980; Ahituv et al., 1989; Tavakolian, 1989; Clark, 1992). Only Ein-Dor and Segev (1982) in their study demonstrated an association between the size of a company, however the size measured by the total turnover rather than the number of employees. Smaller firms tend to centralize IT management, whereas larger firms tend to decentralize it (Sambamurthy and Zmud, 1999). On the contrary, recent research studies have demonstrated that the influence of factors such as, for example, industry, organisational structure, culture, mission, vision and strategy as factors affecting the environment of IT Governance have to be taken into account when designing an appropriate framework for IT Governance. Each framework has different strengths and weaknesses and, of course, overlapping between them occurs. (Kordel, 2004; Symons, 2005; Butler and Butler, 2010).

The research results (Simonsson et al., 2010), based on 35 case studies, confirm the hypotheses of a positive correlation between IT governance maturity and IT governance performance. Although it is reasonable that there is a correlation between the quality of the internal structure of an IT organization – labelled IT governance maturity, and the external impact of the same IT organization on the business – labelled IT governance performance, this has not been validated.

Conclusion

IT Governance is a way of managing IT processes in an organization that aligns the information system and all information technologies with the global strategy of the organization. In the area of strategic alignment of IS/IT with business activities, we recorded the share of the favorable opinion less than 50% in the following variables: IS/IT as one of the strategic objectives of a company, indicators to determine the benefits of IS/IT, regular evaluation of the return on investment in IS/IT. The other two variables had the lowest share within this group (36% and 37%). The share of more than 75% was achieved by 10 variables. The highest share of the favorable opinion was reported by the respondents in case of an appropriate level of knowledge of IS/IT users (88%), an appropriate level of knowledge of IS/IT of the IS/IT unit staff (85%), good relations between the IS/IT unit and its contractors (85%) and efficient investments in IS/IT and their satisfactory return (83%). An interesting finding is that businesses in the conditions of the Slovak Republic are satisfied with their investment efficiency and return even though almost 60% of companies do not carry out regular assessment of the return and do not set indicators to determine the IS/IT benefits.

The principles of IT Governance should be a part of every modern managed organization. Considering its concept, functional IT Governance is primarily the responsibility of the IT Director; its scope, however, interferes with the work of almost all managers throughout the organization. Its introduction, however, is particularly in the interest of the owners because it increases the level of protection of IT investments, compliance with legal obligations, data retention, handling of sensitive information and reduction of a series of risks.

Propulsive Cluster as a Tool to Promote Economic Growth

Yulia Vertakova, South-West State University, Kursk, Russia, vertakova7@yandex.ru

Abstract

The study aims to systematize the known approaches to the definition of the clusters and their typology, the author grouping complemented by a new classification of symptoms associated with the cluster to give impetus to the development of the regional economy as a whole, we introduce a new concept of "cluster of propulsion."
The main purpose of this study is the theoretical development of scientific knowledge in the field of regional cluster.
Keywords: clusters, cluster-based policy, clustering conditions, propulsive cluster

Introduction

The search for effective tools that are able to boost a regional economy is one of the biggest challenges today. This challenge can be met by developing new methods of economic process management. The analysis of world practices in this area has shown that the most suitable method here is cluster approach.
Theoretical and methodological foundations of cluster formation are extensively discussed in the literature. M. Porter was the founder of the cluster approach. The problems of economic space clustering were studied by A. Weber, B. Zimin, A. Lesh, G. Myrdal, X. Richardson and others. The issues related to the formation of regional clusters were studied by many scholars such as Jill C., Deman A., Bengtsson M., Bokhol P., Bryden R., Doyringer B., C. Ketels, P. Krugman, S. MakKibbin, S. Rosenfeld, P. Romer, John Sennett, M. Feldman, E. Feather, H. Schmitz, M. Enright, R. Ezkurra, D. Jacobs, L. Young and others (Enright, M.,1996, Bergman, Ed. M. and Feser, Ed. J., 2000, Ketels, K., 2005). A significant scientific contribution to the development of expertise needed to improve the competitiveness of Russian industrial structures by clustering was made by such scholars as D.A. Akimov, M. Afanasiev, A. Blank, A. Voronov, Y.V. Vertakova, A.R. Yakovlev, V.M.Yuriev, V.A Plotnikov, Y.S. Polozhentseva, Y.I. Treshchevskiy, Risin I.E. and others.

The tasks related with the formation and implementation of a regional cluster policy are rather complicated to fulfill as there are several hindering issues including:

- the ambiguity of the notion “cluster” ;
- vague criteria of classifying an economic activity as a cluster forming one;
- different approaches to include business entities (organizations) either into the cluster center or refer it to cluster periphery as a supporting means ;
- lack of Russian official statistic data on industries or cluster formations (statistical data are available only for different kinds of economic activity), and on the indicators that specify co-operation links between industries (organizations) and their current state (Vertakova Yu. and Polozhentseva Yu., 2016).

Due to these aspects the methodology of cluster formation and development is bound by certain requirements and restrictions. First of all, such methodology should be based on common scientific approaches. At the same time it should take into consideration specific features of a particular social-and-economic system (in our case this is Russian system). The suggested original theoretic approach to clusterization management is founded on the understanding of the inter-dependence between the processes of cluster functioning and economic growth.

1. Definition of "cluster" and its properties

The analysis has shown that the "cluster" concept has not been definitely specified yet, and different scholars in different countries often understand it quite differently, sometimes giving very conflicting definitions. The variety of clusters is characterized by multiple organizational forms, interaction means and the lack of unified legal rules regulating the relationships between cluster members. It presents some difficulties in implementing a cluster policy in assessment of its efficiency.

In our opinion the notion "cluster" cannot be defined absolutely unambiguously. Since Michael Porter investigated the place of clusters in modern market economy and proved that clusters, but not individual enterprises, encourage competitive development of a country, a region or an industry (Porter, M.E., 1998), the term "cluster" has been interpreted very differently with numerous attempts to build up the classification of clusters. To support this statement we have included the table (Table 1) that presents different interpretations of a "cluster" that can be met in referential literature.

Table 1: basic definitions of the "cluster"

Definition	Author/ Source
Definitions of "cluster" as an economic category	
Cluster is a geographic concentration of interconnected companies and institutions in a specific field.	M.E. Porter, 2011
Clusters are groups of interconnected related industries, operating in a certain locality.	M. Delgado, M. Porter, S. Stern, 2009
A cluster is a group of firms, related with economic entities and institutions, which are located close to each other and reach a sufficient scale to develop specialized knowledge, services, resources, suppliers and skills.	US Council on Competitiveness
The cluster is the tendency of firms of similar business type to concentrate close to each other, though without any important special reason for the presence in this area.	C. Crouch, H. Farrell, 2014
A cluster is a concentration of firms able to synergy from their geographical proximity and independence, without their employment scope being significant.	S.A. Rosenfeld
Clusters are groups of companies within the same industry, based in the same territorial area.	G.M.P. Swann, M. Prevezer, 1996
Clusters are large groups of companies within the same industrial sphere concentrated in one place.	G.M.P. Swann, M. Prevezer, D. Stout
Clusters are a network of manufacturers of deeply interconnected firms (including specialized suppliers) linked together in a chain of value-added production.	T. Roelandt, P. den Hertog
Custer is temporary localized group of specific economic agents with an optimal composition and participation of governmental authorities. The cluster is absolutely independent entity acting as a means of innovative development in a specific economic sphere. It is based on the principles of cooperation and competition running under the influence of internal and external environmental factors.	E.V. Poklonova, I.P. Zagora
Cluster is an efficient concentration of interdependent companies competing in a certain economic activity area and making such a golden ratio in the national economy that is able to ensure strong competitive positions on the regional, national and international markets.	A.A. Migranyan
Cluster is a complex economic system that comprises a body of interdependent economic agents such as industrial enterprises having a common production cycle and supporting organizations that render relevant services (banks,	Yu.V. Vertakova, I.E. Risin, 2015

Definition	Author/ Source
consulting companies, marketing organizations, scientific, research and educational institutions, insurance companies, etc.).	
Clusters are not just related and supported by each other's businesses and institutions, but rather institutions are related and support each other, that are more competitive because of their relationships.	E.J. Feser, 2000
Economic clusters are groups of related companies and organizations in the branches of industry which joint cooperation provides a sustainable competitive advantage.	Utah's Economic Cluster Initiative
The economic cluster is a dense network of companies and institutes concentrated in one geographical area. Economic clusters are based on the basis of unique regional assets.	The Reut Institute. Israel
Definitions of "regional cluster" as an economic category	
The regional cluster is an industrial cluster in which member firms are in close proximity to each other	M. Enright
Regional industrial cluster is a cluster elements of which have a common regional location and where the region stands for an area, the labor market, or other functional economic unit	E.M. Bergman, E.J. Feser, 2000
Regional cluster is a pool of companies, universities and other organizations that are linked together acting in a certain industrial area in a given region. The synergy in the cluster is developed in the competitive environment through the co-operation between its members.	N.N. Semenova
Regional cluster is a group of interrelated enterprises and organizations that are concentrated on a certain territory and are united on the bases of common economic interests and/or by functional criteria of ensuring a synergetic effect of their collaboration predetermined by incrementing initial competitive advantages.	Yu.V. Vertakova, Yu.S. Polozhentseva, 2014

Certainly, Table 1 is far from presenting all available definitions of a cluster. However, it is full enough to demonstrate that the "cluster" is quite an abstract category. When trying to define the term more accurately, each author includes some specific cluster attributes that may be related with development level, territorial range, the scope of economic entities representing different industry branches or activity areas, etc. However it is safe to say that different researchers highlight certain features of clusters and put them into the foundation of their original cluster typologies, yet these features might be important for specific analysis with specific research purposes.

Borodkina E.V. and Risin I.E. (2011) have systematized different approaches to cluster typology by summarizing available classifications, emphasizing some productive elements and supplementing them. Thus in accordance with formality criterion all clusters can be divided into institutionalized and non-institutionalized; in accordance with origin criterion they are divided into spontaneously emerged and artificially established by public administration authorities; in accordance with potential development criterion there are active, latent and potential clusters; in accordance with range criterion there are global, inter-country, national, inter-regional, regional and local; in accordance with branch pertaining they are divided into intra-branch, branch and sectoral; in accordance with the predominant technical and technological relations clusters can be vertical or horizontal; and in accordance with their development stage they can be expected, developing, mature and disintegrating.

Many authors are right to mark that there are no unified cluster typology as each categorizing attribute is based on a certain aspect of clusters' functioning. However there is one important aspect that is not addressed properly in the existing cluster specifications. This is the relationship between clusters and economic growth. We suggest that this criterion should be included into cluster classification principles.

2. Classification of clusters based on their economy boosting ability

In our opinion, that has been founded on the reviews of legal and regulatory guidelines, as well as Russian and international expertise in the area of implementing cluster initiatives, there should be another cluster classifier that has not been considered in the literature yet. We mean such aspect as the ability of a cluster to influence the rates of economic growth. After all, evidently it was what Michael Porter implied when he drew parallels between clusters and competitiveness, which in its turn encourages economic growth. However he did not reveal that relationship, though, in our opinion, it has a top priority.

As we have already marked, clusters are always associated with a territorial concentration of economic activity and a more vigorous organizational and productive cooperation interaction with a certain alienation from other economic entities (a cluster is considered to be one of capital concentration forms and a form of integrative entrepreneurial union). Due to this fact the cluster shall be treated as an independent object of studies and administrating (including the influence of public authority exerted within the framework of independent clustering policy). At the same time many of available studies postulate a thesis about unambiguously progressive and positive effects of clusters on social-and-economic system of a region in particular, and the country on the whole, which, unfortunately, has no strict theoretical or empirical evidence. On the contrary, practical experience prompts that it is not always true. Economic effects caused by a cluster can be very different.

In this relation, we propose to distinguish the following cluster types: propulsive, neutral, and catch-up.
The greatest influence on a regional economy is produced by "propulsive" clusters.
The growth rates of value added production inside a propulsive cluster are higher than in the non-clustered part of the economy. The business activity of such clusters results in an increase in the regional economy growth in general as it gets a development impulsion. The multiplier effect produced by such clusters is able to boost the development of social and economic system in the total region. The cluster of this type is often called "a growth pole" (or *pole de croissance* as F. Perroux put it).

Perroux's general theory combines three concepts: dominating economy, harmonized growth and total economy. As Klevtsova M. G. (2012), writes, Perroux's basic proposition (Perroux, F., 1995) is the "domination effect", which consists in the change of the nature and forms of relations between economic entities. This effect results in the "polarization of production" that concentrates around an industry branch in which economic entities behave as parts of a whole ("macroentities"). Finally natural "aggressive" competition disappears, while aggregate efficiency of partners' activities grows up. Such industry can be called "propulsive".

According to François Perroux a leading, or propulsive industry, is the branch that is highly interactive and is dominating in such interactions, i.e. has a propulsion capability. The process of interaction development, that takes place between propulsive branches and/or individual enterprises, with its multi-level structuring is called polarization. As the production units and infrastructures develop, the pole is gradually turning into the center. Thanks to this harmonious development, the industries that constitute a "growth pole" are blending with regional economy environment.

Consequently, the growth pole will entangle individual economic elements existing on a territory into a unified production-economic system acting via key (propulsive) industries. It is worth noting, that in Perroux's opinion the elements of a growth pole interact not only in the horizontal plane, but also vertically (though such interaction may not be expressed very well). This understanding is close to the perception of center-periphery relationships in a cluster. Prof. Perroux (Perroux, F., 1982) also distinguished so called "groups' or "macroentities". A group is an association of unequal economic entities with hierarchic relations. The group that is formed up around an entraining entity (in fact, it is

the kernel of a cluster), that is able and capable of changing the structures, organizational types, growth rates, etc. of other entities, is classified as a stable group.
Thanks to such division of roles between group members, those ones that are developing at a greater rate, "entail' the others. In this case we say that a propulsive cluster has emerged. In this context we understand the propulsive ability as the development force that drives its possessor and at the same time stimulates the growth of other linked members. In other words, "propulsive ability" is the effect of an economic growth force that is able to encourage the growth of all interacting economic entities.

At the same time the considered impulse of regional growth is only a potential. Multiplier effect can be absent (however the nature of such clusters will not be affected leaving them propulsive), an example is the formation of export-biased machine-building assembly production clusters (so called "screwdriver industries"), that are actually "separated" from the regional social and economic system. Nevertheless, in this case such cluster will also produce a propulsive effect on the regional economy due to increasing rates of GRP growth, increased average salaries in the region, increased tax deductions into budgets, etc. In order to differentiate two kinds of propulsive clusters we suggest that they should be provisionally named as "propulsive-multiplying" and "propulsive-isolated" clusters. It must be noted that within a certain time period a propulsive-isolated cluster can alter and become a propulsive-multiplying one. For example it may happen, if a cluster in a region is formed based on significant foreign investments into a "rifle" project involving the establishment of a system of interrelated productions that will gradually evolve from an isolated propulsive cluster into a propulsive cluster with multiplier effect, with this process driven by economic practicability (logistics economy) or purposeful governmental policy (production localization imperatives). More or less similar picture could be observed in Russia in regard to Saint-Petersburg and Kaluga automobile manufacturing clusters.

Unlike propulsive clusters neutral clusters develop at a rate that is comparable with national economy development rate. Hence they are not able to have any notable quantitative effect on the development of the country. Yet, it does not exclude their positive qualitative influence, such as the introduction of new technologies, production diversification, leveling of spatial development distortions, etc.).

The development of catch-up clusters falls behind the development of national economy on the whole. As a rule it can be explained by their evolution stage: a cluster can be either in its early development stage or near the life-time end. From economic point of view such clusters are inefficient, as the resources are spent non-optimally. However their preservation can be justified from the social point of view. For example, they can keep employment rate at a desired level.

Table 2: type of cluster in their ability to affect the rate of economic growth

Type of cluster	The impact on economic growth of the economy	Examples of the clusters in the Russian Federation
1.Propulsive - propulsive-multiplied - propulsive-isolated	The dominant industries of the development poles interact with the resources of the region, connect the individual elements of the territory. Due to the increase in the growth rate of GRP, the average salary of the employed population, tax payments to the budget, etc. they have a positive effect on the regional economy.	The automotive clusters in Leningrad and Kaluga regions The pharmaceutical cluster in St. Petersburg The livestock cluster in Belgorod region
2.Neutral	They lead to the appearance of the positive synergy effects due to the increase in connectivity of the economic system, increase of its stability and the level of innovativeness, diversification of economic activities, involvement in the turnover of new resources.	The Electrical cluster in the Kursk region The Innovative regional clusters of rocket engine "Technopolis" New Star" in the Perm region

	It impacts the improvement of the static characteristics and this is due to greater employment, production of goods and services higher in quality and quantity in the region. This initiates structural changes in the economy due to the incorporation of innovative technologies, the introduction of new standards of governance and social responsibility, manufacturing the more modern and popular products.	The Sarovsky innovative cluster in the Nizhny Novgorod region
3.Catch-up	It is aimed at maintenance of social stability in the region. That promotes the growth of not only the region's economy, but the improvement of social indicators and increasing standards of living.	The textile cluster in the Ivanovo region The aircraft manufacturing cluster in the Voronezh region

Conclusions

1. The term and notion "cluster" still need to be clarified and unified. Cluster diversity is characterized by numerous organizational forms and various interaction mechanisms, as well as by the lack of unified legal rules regulating the relations between cluster members.

2. We define a cluster as a complex economic system comprising a totality of interrelated economic entities, for example industrial enterprises linked by a common production cycle, with their supporting organizations (banks, consulting and marketing organizations, insurance companies, research and educational institutions, etc.), that are concentrated on a certain territory, united either by common economic interests or/and by functional criteria, and are able to produce the effect of synergy due to their interaction determined by gradual extension of their initial competitive advantages.

3. Cluster typologies built up by different researchers are based on different features of clusters, consequently there is still no unified classification of clusters. Clusters can be split into categories based on the following criteria: formalization degree, origin, potential realization rate, development scale, industrial affiliation, character of dominating technical and technological links, production and capital concentration entities, competitive ability, innovation rate, etc.

4. We propose a new cluster classification criterion that has not been applied explicitly so far. This criterion is the ability of a cluster to influence economic growth rates. The existence of such cluster characteristic was supposed by Michael Porter who used to link clusters with competitive ability influence on economic growth. In our opinion, the ability of a cluster to produce economy boosting impulse (propulsive impact) in the process of its formation and development has the top priority.

5. Consequently, all clusters should be divided into the following classes:
-**propulsive** - a cluster that can produce the multiplier effect and influence regional economy development rates by imparting boosting impulse; this cluster is based on key (propulsive) industries that link individual territorial elements into a unified economic system;
-**neutral** – a cluster that is developing at a rate comparable with the regional economy development rates; its activity is not able to accelerate economic growth, but even without economy boosting effect it is able to initiate positive structural changes (for example, due to the introduction of innovative technologies, new management and social responsibility standards, production up-grading, etc.);
- **catch-up** – a cluster that is developing at a slower rate compared with the regional economy growth, which can be explained by a certain stage of its life cycle; in case of its constantly low performance indicators, the most efficient measure would certainly be its demolition (production process re-

engineering, innovative renovation and refurbishment, etc.,), however, it should be understood that if economic situation changes (for example, in case of an abrupt national currency devaluation, externally implied restrictions caused by foreign policy situation or economic sanctions), the status of such cluster can be changed, so its abolition may be impractical and by all means demands a thorough preliminary analysis.

We believe that the proposed classification and methodology of distinguishing propulsive clusters can be favorably used in the practice of cluster policy implementation in different countries. However it must be noted that because of the dominating organizational economic link such clusters cannot be of "market" nature, when small- and medium-size businesses, that use the same resources localized on a certain territory, make up a voluntary union. Such clusters can be either quasi-market (with one dominating company that affiliates smaller entities on subcontracting or outsourcing terms) or administrative, i.e. established by the government in order to exercise its functions and meet long-term goals.

Abstract

The paper represents an evaluation technique of clustering conditions characterized by using the iterative method. The main goal of the first stage is to evaluate technical and technological conditions of cluster formation – in every region some industries and enterprises are selected to be the "core" of future cluster. For this purpose localization factor, specialization ratio and per capita production ratio are being estimated. As a result, virtual clusters are formed, promising to turn into real ones. Then we aim at the evaluation and development of socio-economic and institutional conditions of the regions required to form actual clustering. In the second place the system-wide clustering conditions are estimated considering a set of indicators of socio-economic conditions which are hopeful for regional clustering. After that we carry out classification and ranking based on a set of statistical ratios. It results in virtual cluster formation differing in adequacy level of technical and technological, socio-economic conditions in order to form real clusters. Further in the fourth place virtual cluster analysis is practiced in order to identify both its general strengths and weaknesses. Finally, at the fifth stage formal and informal regional institutions are being estimated with respect to each virtual cluster. The development measures of socio-economic and institutional processes are being worked out for those regions in which they are going to form clusters. As a result we have obtained the data concerned the promising regional industries of Central Federal District to be involved into clustering. Besides, the authors have evaluated the platform of district regions to form radioelectronic cluster.

Keywords: clusters, cluster-based policy, methodical approach, industrial localization, specialization, production per capita, competitiveness, clustering conditions.

1. Introduction

Cluster development in economy is a challenging issue of many countries both developed and developing, discussed in studies by various authors (Afanasyev, 2005; Bergman and Feser, 1999; Boekholt and McKibbin, 2000; Delgado and Porter, 2011; Doeringer and Topakian, 1987). Economic clusters are defined as being totality of economic entities inter-linked to each other in business transactions. They together use natural, renewable physical and labour resources which permits to create auxiliary facilities for development and competitive growth. Not by chance, when identifying Global Competitiveness Index (GCI) (http://www.gks.ru/wps/wcm/connect/rosstat_main/rosstat/ru/apps/) and Business Competitiveness Index (BCI) significant attention is being paid to clusters, selecting them as one of the competitive growth areas (http://www.photius.com/rankings/economy/gdp_per_capita_2014_0.html). At the same time many countries including Russian Federation consider cluster development as spontaneous market formation without allocating them as one of the mechanisms of efficiency improvement of the state economic policy. In this case the benchmark targeted by public authorities is not fulfilled and also some member interests are not fully implemented. Therefore, the process studies and cluster forming techniques both spontaneous and controlled represent a great research interest and are up-to-date ones.

2. Problem statement

The current state of the economy largely depends not only on public sectors in which economic entities are functioning, but also on the nature and close links between them. Some companies may have significant power, high performance, but without being a part of the system with advanced technical and technological, organizational economic and institutional relations, with rare exceptions, are not able to participate in the increment and implementation of a comprehensive, systematic development of the territories.

The global competitive growth is limited in those countries exploring insufficient interconnection between stake holders and between governmental institutions and business as well. On the contrary, in highly competitive countries a visible and steady trend in cluster formation is observed. In most countries such as France, Spain, Norway, Italy, Great Britain, Austria, the USA, Finland, Denmark clustering processes are widely used. Here we can also observe high values of GCI index. This competitive rating is based on a combination of the public statistical information and the company executives' interviews which represent a comprehensive annual survey conducted by the World Economic Forum together with its network of partner organizations (http://business-swiss.ch/wp-content/uploads/2014/09/GCR_Rankings_2014-2015.pdf).

Table 1 illustrates information about the leaders by Competitiveness Index in 2015 and the plant concentration in these countries.

Table 1- Russia and Leading Countries according to Global Competitiveness Index and cluster-based policy development

Country	The Global Competitiveness index , in 2015	Cluster quantities	Per capita production, $	Specialization level of industrial production, %
Switzerland	1	5 Mega-clusters	58,149	68,1
Singapore	2	3 Mega-clusters	83,066	70,9
The USA	3	380	54,370	71,8
Finland	4	9	40,661	67,1
The Netherlands	7	10 Mega-clusters	47,960	61,9
Denmark	13	29	44,625	67,0
Russia	53	72	24,449	20,8

Source: worked out by Y.Vertakova based on the data of the global competitiveness rating (The Global Competitiveness report 2014–2015) and of international Bank for Reconstruction and Development http://data.worldbank.org

The assumptions in the table are as follows: by "per capita production" we mean gross domestic product per capita (by purchasing power parity) GDP per capita; a rate of manufactures in total exports is given, i.e. availability of specialization in the sectoral economic structure is partially characterized by the rate of specialization in total export.

The advanced countries' cluster analysis has revealed that the development trend of sectoral specialization areas is becoming increasingly important. It results in an adequate effort to concentrate some branches of industry in a particular location. Therefore, in order to form clusters companies choose the locations which offer some advantages. According to the table there is a direct relationship between the level of competitiveness and the level of industry specialization. Highly specialized industrial

production leads to an increase in national competitiveness. At the same time, high specialization requires cooperation. This leads to the formation and development of clusters. Therefore, developing promotion can enhance competitiveness.

In our view, while implementing cluster policy it is important to assess clustering conditions of socio-economic space. At the same time, this problem is decomposed into two fractions: 1) identification of existing clusters and cluster initiatives; 2) identification of potential clusters (Treshchevskiy, 2006; Vertakova and Plotnikov, 2013, 2014; Vertakova and Risin, 2015; Kuzbozhev, Kozeva and Klevtsova, 2011; Vertakova, Polozhentseva and Klevtsova, 2015).

There exist several approaches to identify potential clusters in the socio-economic regional space of the country (Eskurra and Rapun, 2006; Feldman and Audretsch, 1999; Feser, 1998). The main aim of this study is reviewing methodical approach to cluster identification based on cluster properties such as being a part of socio-economic and organizational system. Exploring this approach we undertake a series of logical steps which could be applied to the economy of various countries.

3. Overview of recent research and the brief literature review

A great number of scientists has investigated the theory and the methodology for the cluster formation based on the experience gathered in the field. It should be noted that M. Porter was a founder of cluster approach. Such researchers as G. Myrdal, X. Richardson and others studied the issues concerned space clustering. M. Bengtsson, C. Ketels, P. Krugman, S. Rosenfeld, P. Romer, M. Feldman, H. Schmitz, M. Enright, P. Eskurr and others are actively investigating the issues related to the formation of regional clusters. A significant contribution to the development of scientific knowledge for increasing the competitiveness of Russian industrial structures by clustering were made by such researchers as A. Blank, Y. Vertakova, A. Yakovlev, V. Plotnikov, Y. Polozhentseva, I. Risin, N. Sirotkina, E. Sibirskaya, S. Rastvortseva, Y. Treshchevskiy etc.

4. Purpose

The main purpose of the paper is to form a new methodological approach for the identification of clusters in the economy. That will allow to develop scientific and methodical recommendations for improving clustering process of socio-economic space.

5. Results and Discussion

Underlying the fact that there is no unified approach to the definition of "cluster" we offer to expand our previously proposed interpretation of cluster. It should be defined as a system of socio-economic and organizational content.

Considering the socio-economic point of view, cluster is characterized by high production and capital concentration within a particular location, being enough to start inter-connected activities. It is also specified by the existence of common competitive advantages and by enhanced competitiveness in relation to other systems as well.

In organizational terms, cluster is a set of economic entities with different institutional nature, forming a single system by means of technical and technological, market and institutional linkages; besides it is characterized by a long-term cooperation.

This cluster definition highlights some of the common features that characterize cluster systems:

- economic entities i.e. participants of the cluster system co-located in specific geographic region;

- steady technological links between economic entities – cluster system participants;
- long-term cooperative relationship between system participants in providing manufacturing programme, innovation, key management and quality control;
- creating the enterprise "core" in cluster to produce highly competitive goods which benefit from its appropriate competitive location;
- entry of "peripheral" i.e. business groups which are not linked in a particular production field (scientific, educational, financial and other organizations) and related to different functional subsystems of socio-economic geographic system into cluster.

Regarding these statements it is obvious that the evaluation of clustering conditions will differ in using iterative techniques. We have pointed out five stages, which may be characterized as follows:

1. The main goal of the first stage is to select some industries and enterprises which will be the "core" of future cluster in every regional location. For this purpose we believe that to identify such a role we can use the following three ratios (indicators) (Kuzbozhev, Kozeva and Klevtsova, 2011):

1) localization ratio defined as a relation ratio of some production in same industry group within geographical manufacturing structure between its ratio on a national scale (formula 1)

$$K_{LM} = \frac{Vir}{Vr} : \frac{Vic}{Vc} \quad (1)$$

where K_{LM} – localization ratio of separate production
V_{ir} - production output of the nth regional economic sector
V_{ic} - production output of the nth national economic sector
V_r – regional production output
V_c – nation's production output

2) per capita production ratio:

$$K_{pp} = \frac{Vir}{Vic} : \frac{Pr}{Pc} \quad (2)$$

where Kpp – per capita production ratio
Vir – production output of the nth regional economic sector
Vic – production output of the nth national economic sector
Pr – the population of the region
Pc – commonwealth (the population of RF)

3) specialization ratio:

$$K_{sp} = \frac{Vir}{Vic} : \frac{GRP}{GDP} \quad (3)$$

where Ksp – specialization ratio of the region in nth industry
Vir - production output of the nth regional economic sector
Vic - production output of the nth national economic sector
GRP – Gross Regional Product
GDP – Gross Domestic Product

Here we can add some other indicators, including:

- investment volume per employee in industry (of economic activity), serving as a base while forming the "core" of cluster;
- labor productivity in the primary sector;
- capital-labour ratio in the primary sector.

When the values of the calculated indicators are significantly greater than one, it could be concluded that the productions involved are areas of market specialization within this geography. And it is possible to create clusters here.

2. Next step should be devoted to the assessment of the system-wide conditions being important for clustering with regard to the selected locations. For the best results we use a set of statistical ratios. They could be as follows:

- the number of organizations engaged in research and development;
- the number of personnel engaged in research and development;
- domestic expenditure on research and development;
- the number of granted patents;
- the number of advanced production techniques;
- the number of advanced production techniques being used;
- innovative activity of organizations;
- expenditure on technological innovation;
- the share of innovative products , works and services;
- participation (labour force) rate;
- rate of academically and professionally trained population
- the number of students per 10 000 population;
-the number of organizations utilizing information and communication technologies;
- balanced financial result;
- capital investment per capita.

3. After that we carry out classification and ranking based on the totality of statistical factors. It results in virtual cluster formations which have sufficient conditions to form actual clustering in socio-economic space.

4. Further in the fourth place virtual cluster analysis is practiced in order to identify its overall strengths and weaknesses and to estimate sufficient conditions for clustering.

5. Finally, at the fifth stage using a survey we estimate clustering conditions with respect to each regional virtual cluster. The conditions must have qualitative characteristics only. These conditions are as follows:

- existence of regional legislation governing (controlling) clustering processes;
- existence of an authority coordinating activities of cluster members;
- existence and quality of a mechanism controlling clustering processes;
- existence and efficiency of regional development institutions;
- a variety of methods and tools of the state influence on clustering processes.

The obtained results allow to allocate areas within each virtual cluster and simultaneously to identify if these areas have sufficient or insufficient conditions for real clustering with qualitative characteristics only.

Thus, the desired evaluation is formed by series of complementary partial estimates, which detect the selective and system-wide clustering conditions in the region. In its turn a set of statistical indicators and expert data helps to reflect these conditions.

We believe that the results obtained by using this methodical approach can become the basis for the strategic development of clustering process management of regional socio-economic space .

We have carried out the practical approval of the proposed approach to form radioelectronic cluster in Central Federal District of the Russian Federation.

At first in order to implement a proposed approach, the authors evaluate technical and technological conditions of cluster formation – in every region some industries and enterprises are selected to be the "core" of future cluster. For this purpose localization factor (ratio), specialization ratio and per capita production ratio are being estimated by economic activities included in manufacturing production. When the value of each ratio is above 1.0 it verifies that there are objective conditions for cluster formation.

Table 2 shows the final estimated results of clustering conditions by regions of RF and types of manufacturing industries (intermediate calculations and conclusions are omitted). It should be noted that the most part of boxes in Table 2 remains blank. Thus we can conclude that from the economic point of view the combination of these regions and industrial sectors is unfavourable for clustering.

Completed boxes signify that specialization ratio is sufficient to form cluster. Colored boxes signify that there are favourable conditions to form clusters regarding all three ratios. The activities being performed in these areas have a high potential for clustering of socio-economic space.

The possibilities to form specific clusters could be proved by vertical analysis considering given industrial sectors. Having studied one industrial sector (12- electrical, electronic and optical equipment production) we found out that in some regions of RF there are favourable conditions to form radioelectronic cluster (table 3.).

Table 2 – Specialization ratios by regions and industrial sectors benefiting from production localization and production per capita.*

Region	Industrial sectors											
	1	2	3	4	5	6	7	8	10	11	12	13
1	4,4								4,6			
3	2,8	4,1		4,6				2,9		2,9	3,4	
4	2,0						2,4					
5		36,1		5,0								
6											8,8	17,3
7		2,5		28,8								
8			2,1				2,3	2,4				
9	3,0								18,7	3,2		
10	1,8			2,1	1,4		1,8	2,9		2,6		
11										3,0		
12			9,0			2,2					3,3	

13		3,3		6,4			2,8	3,2			2,4	
15		3,3	16,5	4,6				3,1				4,2
16							8,3		4,3			
17			3,9				1,9	3,8		2,5	1,8	3,9
18					0,9	1,5					0,6	

In the table the following notations are used: **industrial sectors**: 1- food production including tobacco and beverages;2- textile and garment manufactures;3- leather manufacture, leather goods and footwear manufacturing; 4- wood processing and wood products manufacture; 5- pulp and paper production; publishing and printing activities; 6-manufacture of coke and petroleum products ; 7-chemical production; 8-manufacture of rubber and plastic products; 9-manufacture of other non-metallic mineral products; 10-metallurgical production and hardware manufacture; 11-machinery and equipment production; 12-electrical, electronic and optical equipment production; 13-production of transport and equipment.

Regions of the Russian Federation: 1 – Belgorod region; 2 – Bryansk region, 3 – Vladimir region, 4 – Voronezh region, 5 – Ivanovo region, 6 – Kaluga region, 7 – Kostroma region, 8 –Kursk region, 9 –Lipetsk region, 10 – Moscow region, 11 – Oryol region, 12 – Ryazan region, 13 – Smolensk region, 14 – Tambov region, 15 – Tver region, 16 – Tula region, 17 – Yaroslavl region, 18 – Moscow city.

*Completed boxes signify that specialization ratio is sufficient to form cluster. Colored boxes signify that there are favorable conditions to form clusters regarding all three ratios.

Table 3 – Identifying prospects to form radioelectronic cluster in Central Federal District of the Russian Federation by concentration ratio of electrical, electronic and optical equipment production .

Region	Localization factor (ratio)	Per capita production ratio	Specialization ratio
Regions in which there is an absolute advantage to form cluster			
6 Kaluga	2,60464	5,6148	8,87503
12 Ryazan	2,02592	1,58197	3,3231
3 Vladimir	1,7105	1,51152	3,42805
13 Smolensk	1,64709	1,12359	2,47681
17 Yaroslavl	1,18357	1,05831	1,87471
Regions where there are relatively favorable conditions to form cluster			
8 Kursk	1,09567	0,52807	1,0559
10 Moscow	0,78717	0,86403	1,15304
11 Oryol	0,94	0,44055	1,06502
15 Tver	0,81812	0,52276	1,18575
16 Tula	0,57892	0,63453	1,43381
14 Tambov	1,61847	0,64433	1,5515
18 Moscow city	1,05969	1,25238	0,62197
Regions in which there are no conditions for clustering			
4 Voronezh	0,92991	0,51536	0,9561
1 Belgorod	0,13679	0,18844	0,23974
2 Bryansk	0,56138	0,25266	0,68852

5 Ivanovo	0,36472	0,14801	0,51696
9 Lipetsk	0,11112	0,18867	0,33748
7 Kostroma	0,36956	0,27784	0,63214

As it can be seen from the data presented in Table 3 we confirm that regarding all 3 ratios i.e. localization ratio, per capita production ratio as well as specialization ratio and in terms of absolute and relative advantages not only the absolute leader Kaluga has more favorable conditions for the cluster formation, but a number of other regions such as Vladimir, Ryazan, Smolensk, Yaroslavl has also friendly environment to form cluster.

Furthermore we can say that Kursk, Moscow, Tambov regions as well as Moscow city also have relatively favorable facilities for cluster formation. That is why namely these regions must obtain governmental support to form and develop this cluster. Similar calculations can be performed by all types of activities of any country with regard to its territorial division.

Conclusions

We have proposed a methodical approach based on the following assumptions.

1. The formation of any cluster is mainly connected with the creation of its “core”. Cluster participants are the companies producing rival products in which the competitive advantages of the location are implemented. In this context, the evaluation of clustering conditions should primarily cover those Russian industrial sectors which are planning to start such production.

2. Cluster represents a business group consisted of the “core” and the “periphery” as well. Cluster participants are the companies which are not linked in a particular production field (scientific, educational, financial and other organizations) and related to different functional subsystems of socio-economic geographic system. Therefore, the evaluation of clustering conditions should include system-wide parameters being important for all cluster organizations.

3. The conditions being significant for clustering have a variety of characteristics. Some of them could be estimated by the state statistical indicators only. Another part is verified only by qualitative estimates obtained from the experts.

4. Seeing that the clustering processes have a through scope in spatial economy, it is advisable to identify its best and worst conditions. So there is a need to group the regions of the country according to this characteristic.

In view of these provisions, we have proposed a new methodical approach to evaluate clustering conditions. We believe that given iterative technique could be used when considering the territorial division of different countries. The authors have given reasons for selecting five stages which are characterized in the paper.

Acknowledgment

The study was performed as part of the state order of the Ministry of Education and Science of the Russian Federation No 26.2671.2014 "Theoretical and methodological foundations of development and implementation of cluster policy at regional level and scientific-methodical substantiation instruments of progressive structural transformations of the regional socio-economic systems".

Abstract

The aim of the article is to study the experience of the use of PPPs in education in different countries and to offer the basic directions of development of PPP in the field of education in Russia.

The economic prerequisites for the development of public-private partnerships are revealed in the article. Analysis of the experience with public-private partnerships and other countries is carried out. Conditions for the development of public-private partnerships are shown. Regularities and principles of PPP subjects that promote the economic growth of the country are systematized. These results allow us to offer effective enablers of public-private partnership policy.

The basic principles of the subjects of public-private partnership in the management of education are determined.

The factors that help to give effect to public-private partnership policy are revealed.

This paper was carried out within the state scientific task No 26.2671.2014/K "Theoretical and methodological basis for the development and implementation of a cluster-based policy at the regional level and scientific and methodological foundations of the tools of the structural benchmarks of the regional social and economic system".

Keywords: public-private partnership, strategic management, management of the educationalsphere.

Introduction

People who wish to ensure the competitiveness of products of the enterprises in the conditions of globalization of the economy and take their rightful place in the international division of labor, should strive to increase the number of highly qualified specialists .

The aim of the introduction of public-private partnership in the sphere of vocational training is to increase the technological and intellectual potential of higher education and science as a condition for stable economic growth and modernization of the economy.

There is a need to create a modern model of personnel training system considering international trends in the modernization of higher education systems.

Many studies are devoted to the analysis of the state's role in the modern economy, among which we should mark out the fundamental works of Western scholars such as E. Atkinson, J. Stiglitz, G. Tullock, I. Shihata, as well as the World Bank reports. Various aspects of the nature of the PPP, as well as the processes of its formation and functioning are deeply studied by foreign researchers, among which are the works of T. Barnekov, R. Boyle, L. Dzheziruski, M. Gerrard, S. Kitajima, F. Cook, D. Rich.

Some modern Russian scientists such as M.N. Afanasiev, V.P. Bocharov, Y. Vertakova, S.Y. Glazyev, G.V. Gorlanova, G.A. Drobot, S.S. Evtyuhova, A.Y. Zudina, A.D. Nekipelova, I.M. Osadchaya, V.A. Plotnikov, B.G. Preobragensky, I.E. Risin, D.A. Rozenkova, E.V. Sibirskaya, Y.I. Treshchevskiy, Ya.Sh. Pappe, S.P. Peregudova, F.I. Shamkhalova, U. Shishkov, Yasin and others devote their works to the study of the various aspects of cooperation between the state and businesses.

Economic and organizational capacity and features of public-private partnership are discussed in the works of O.S. Belokrylova, V.G. Varnavsky, L.I. Efimova, O.A. Lomovtseva, V.A. Mikheev, T.N. Sannikova, B. Stolyarov and A. Shmarov. Important political and legal aspects of public-private partnership in Russia have found the illumination in the works of M.V. Vilisov, S.S. Sulakshin, E.A. Khrustalyova, V.I. Yakunin.

Despite the growing interest of scientists to the named domain, many of the fundamental issues are while only marked, but not solved, including those wuch are related to the formation of the system of ideas about nature, functional and procedural content of public-private partnership, the principles and the mechanism of its organization, development prospects.

Results and Discussion

The cooperation of the private sector and government to address socially important problems has a long history, both in Russia and abroad.

However, the public-private partnership as the actual direction of the interaction of legal entities, including educational institutions, has started to develop rapidly in recent decades.

This is due to both the increasing complexity of the socio-economic relations and business interest in new investment objects.

Public-private partnership (PPP) is a set of forms of medium- and long-term cooperation between the state and business to solve socially significant problems on mutually beneficial terms.

We understand public-private partnership in the education as a system of long-term relations between the state (representing his subjects) and the subjects of the private economic sector for the implementation of professional education, based on the incorporation of resources and the distribution of income or intangible benefits , expenses and risks.

The existence of public-private partnership is beneficial to the state because the attraction of financial resources in business schools can reduce budget expenses.

It is necessary to study the practice of developed countries to expand the scope of public-private partnership in Russia, the development of new models of interaction between business and government, including the cooperation of universities and enterprises in the implementation of vocational training programs, which has produced a variety of options to stimulate the efficiency of public-private partnership at the moment [6, p. 680].

A very wide range of business models and relationships is implied public-private partnership in the developed countries.

In the most general sense, the term is used for any use of the resources of the private sector to suffice the public's needs.

Areas of application of public-private partnership in foreign countries are very diverse.

The cooperation between partners can take place under different legislative frameworks, with a diverse range of problems and competences.

Table 42- Analysis ofthe experience of developedcountries inthe use ofPPPin education

Types of PPP	Countries	Characterize
1. Scheme of education fund	France	- provision of tax revenue, used by the government subseque financing the education (is formed mainly by taxes, fees, pa from the fund of commercial organizations wage);
	Denmark	- «tax shield", i.e. the release of the commercial organizatio taxes or reduce their level, including the establishment of m employer investments in training (mostly in the form of a perce the wages fund);
	Sweden	- tax-grants - collected taxes are distributed among the organ that implement the directions of training programs that are adm a priority by the state and / or industry.
2. Grant supporteducati	the USA	- Stateeducationalgrant support(the Ford Foundation, the Carneg MacArthur);
	France	- The Ministry of Educationallocateslocaladministrative unitsof decentralizationgrantto coverpart of thecurrent expensesto maint

3. The manage model in the development o education	the UK	- model of the limited role of the state. The government defines only the levels of qualification star and regulates the quality of education. Business determines the content of educational programs ar cooperates with educational institutions in the framework of soc partnership;
	France	– - a model of active state involvement in the planni realization of vocational training pr – In France, the central government authorities pass responsibilities to regional structures and actively involve partners to the development and implementation of educational as professional associations, chambers of commerce, trade unic so on without giving up entirely on the regulatory process of vo education and training;
	Germany, De Netherlands	– - state regulation model in the activities of private cor and organizations involved in vocational education and t - For example, in Germany the social partners are actively invo the development of vocational education qualifi - Primary study of the need for the necessary professional ec programs is carried out at the regional (Land) level, on wh Federal Institute for vocational training (BIBB) prepares the ne documents of the structure and content of the program, the mecl of its preparation and impleme Then, employers' associations, trade unions, federal an governments reach an agreement on the coordinators of new pr and administrative proc - FurtherrelevantministryandBIBBmodifythedocuments
4.Service infrastructurein education	the USA, England, et National Association Business Inc in Russia (N	– creation of business incubators, i.e.specializedstructuresthat p favorable environmentfor beginners anddevelopingsmall ent andrendering services;
	the US, Russiaand ot	– creation ofservicesto facilitatethe employmentof graduates

As world practice shows, the most relevant and effective way to solve the identified problem is to organize the cooperation between the state, business and education by means of public-private partnership mechanisms.

Speaking about the public-private partnership in scientific and innovative areas, it is necessary to emphasize the importance of applying the theory of the "triple helix» (Triple Helix) in the implementation of PPP projects.

This theory was developed by Henry Etzkowitz, professor at Newcastle University, and LoyetLeydesdorf, professor at Amsterdam University, in England and the Netherlands in the beginning of the XXI century.

The triple helix symbolizes the union between government, business and universities, which are key elements of the innovation system of any country [8, p. 538].

World leaders in the field of public-private partnership are the United States, France, Britain, France and Germany.

In general, the experience of public-private partnership in several European countries in the management of a meaningful component of vocational education can be presented as Table 41.

Table 41 presents stimulating PPP mechanisms used in other countries for the development of universities.

Table 41 - The experience of public-private partnership of European countries in the management of vocational education

Adopting the experience of foreign countries, we can conclude that the prospects for the development of public-private partnership in Russia should be determined by changes in the regulatory framework, the education system modernization process and social demographic factors.

At the same time the basic conditions for the development of PPP mechanisms should be government support of research and educational activities and the modernization of the education system; State support of private business and business cooperation initiatives with universities; the adoption of measures for the

implementation of new financial, organizational and economic mechanisms of educational institutions [5, p. 414].

The objectives of the implementation of PPPs in the field of vocational training are:
• expansion of the estate and the financial base of vocational education by attracting extrabudgetary funding sources; ensuring the competitiveness of institutions of higher education and science, promoting convergence of basic and applied research;
• ensuring the competitiveness of educational programs, improving their quality;
• improving the efficiency of state property management in the field of vocational training;
• creation of innovative infrastructure of the university;
• satisfaction with the dynamically changing demands of the labor market, gain of innovation component of education and science.

The main areas of public-private partnership in the field of higher education are:
- orders for training
- execution of research projects;
-scholarship and grant support of teachers and students;
- joint educational programs aimed at training the necessary specialists;
- improvement of material and technical base.

Till now there is no specific law in Russia governing at the federal level all the questions arising in the field of PPP in education.

Activities of PPP in education are regulated by a number of legislative acts.

Formation and development of the national PPP model is largely determined by the readiness of private sector entities, government and education to interact with each other on the partnership principle.

Education system management in PPP mechanism may be based on the application of procedural, structural and systemic approaches:

1. The procedural aspect of the education system is considered as a set of intermediate and final stages of the organization of continuous multilevel training for the region's economy;

2. structurally it is a set of powers and responsibility for the results of operations;

3. The system view includes the following elements:

a) the purpose and results of the system, deterministic structure of the region's economy, its strategic priorities;

b) the conditions of the education system (level of material and technical base, social infrastructure, matching labor market of educational services in the region);

c) the results correlated with the resources and objectives of the development of the regional economy.

Management process is complied to the action of general laws of a stable and regulatory linkages between PPP subjects and objects of the education system, as well as an additional set of specific laws and principles (tab. 40).

Table 40-Patterns principles ofPPP subjectsin the management of education

Conclusion

Thus, the use of PPPs in education allows to universities to increase the intellectual potential of higher education, what ultimately leads to the modernization of the economy and economic growth.
In this regard, the following PPP development directions in the field of vocational training are:
• expansion of the use of PPPs;
• raise awareness of developments in the labor market and the education market;
• creation of favorable organizational, legal and economic conditions and mechanisms that promote the development of PPP practice in the field of education;
• Feedback system of vocational education with the development of the regional economy;
• the development of perspective and innovative forms of PPPs
• Increasing public participation in the management of vocational education system;
• improving the legal and regulatory and procedural framework governing the use of PPPs in education;
attraction of additional sources of funding in higher, secondary and primary vocational education.
Thus, the successful operation of public-private partnership is not possible without an effective system of state support.
Strengthening the role of state regulation of PPP should be based on the priorities of economic policy, a modern legislative framework of PPP regulation system stimulating innovative business through tax, financial and credit policies, developed infrastructure.

Abstract

The formation and development issues of industrial production in the innovation economy in Russia are being discussed in the given article. To achieve these aims the analysis of the dynamics and structure of foreign trade of the country has been made, the dependence of Europe on Russian natural gas has been revealed and the share of exports and imports in GDP has been justified. The special role in the formation of the import-substituting strategy as the system of incentives to support the national production of export products has been emphasized. The main strategic directions of industrial policies have also been suggested.
This paper has been out within the state scientific task No 26.2671.2014/K "Theoretical and Methodological Basis for the Development and Implementation of a Cluster-Based Policy at the Regional Level and Scientific and Methodological Foundations of the Tools of the Structural Benchmarks of the Regional Social and Economic System".

Keywords: foreign trade, foreign trade turnover, import-substituting strategy

Introduction

Fundamental principles of the theoretical and methodological approaches to the study of economic categories of industrial policy were laid down in the writings of great scholars such as Adam Smith, David Ricardo, JS Mill, A. Marshall, J. Robinson et al.
Applied evaluation aspects of the implementation regulation of economic processes are reflected in the works of Y.V. Vertakova, N.G. Hajiyev, K.S. Garanian, T.V. Goryachev, A.V. Komogortseva, S.N. Krekotneva, A.V. Lopota, M.V. Loskutova, K.M. Misko, V.A. Plotnikov, I.E. Risin, E.V. Siberian, E.K. Shabalin, M.N. Yan'shin and others.
Conceptual foundations of industrial management on the basis of assessing the effectiveness of current policies are presented in the studies of L.M. Albitera, S.Z. Asadulaeva, M.A. Bagomedova, A.A. Huseynov, Y.N. Dubenetsky, N.V. Koryakina, F.A. Kostina N.N. Lebedeva, O.A. Romanova, A.I. Tatarkina, Y. Friedman, V.A. Zuckerman, A.G. Shepsheleva, B.M. Shtulbergaets.
Despite the availability of numerous works in the field of state industrial policy, regulatory issues of export-import relations between states, as well as assessing the effectiveness of the implementation of management measures in the literature have been fragmentarily highlighted.
There are practically no publications dealing with a complex multi-level assessment of the effectiveness of implemented policy of industrial production.

Results and Discussion

Over the past decades we have marked the differences in growth rates and directions of foreign trade activities in Russia. These trends have led to the significant shifts both in the geographical and commodity structure of foreign trade turnover of Russia.
During the 90s The Russian Federation consistently drove its trade balance surplus. This also referred to the balance of export-import operations of Russia with foreign countries. In the middle of this decade imports from CIS countries slightly exceeded the amount of goods delivered from Russia.

In general, the dynamics and the geographical structure of Russian foreign trade are as follows (Table 1).

Table 1 - Dynamics and geographic structure of Russian foreign trade

Socio-economic indicators of the Russian Federation in1991-2014 (Appendix to the book "Statistical Yearbook of Russia. 2015". Available: http://www.gks.ru/wps/wcm/connect/rosstat_main/rosstat/ru/statistics/publications/catalog/doc_1270707126016

Since 1995 the rate of growth in foreign trade turnover of the Russian Federation, especially after 2000 was not bad and it even increased by 1/6 and 1/5 over the year respectively.

The expansion of cooperation with the CIS countries is one of the main directions of foreign trade and foreign economic relations of Russia, which have been set up on three levels. The share of CIS countries accounts for about 1/4 of the total volume of the Russia foreign trade turnover.

In recent years more than 3/4 of the total value of exports of the Russian Federation (including trade with the CIS member states) account for commodities. Thus, in the years of 2013-2014. in the total exports of goods, Russia's share in the "Mineral products" group, i.e. mainly fuel and energy products accounted for 56.5%; ferrous and non-ferrous metals accounted for 11.4%; timber and pulp and paper products - 3.3%, and machinery, equipment and vehicles - 8.9%; chemicals and other products - 19.9%.

The structural changes that took place in the Russian economy during the restructuring had an impact on the structure of foreign trade of the country. The share of engineering products in the domestic machine-building production decreased from 30% to 17%, light industry - from 12% to 2%, while the share of fuel and energy complex increased from 11% to 33%.

In connection with these processes in the commodity structure of export the country's share of raw materials and semi-finished products increased from 84% in 2002 to almost 90% in 2012, while the share of finished products declined from 16% to 10%, which was due, above all, to non-competitiveness of most of the types of finished goods offered for export, as well as the difficult financial situation of the Russian enterprises [4, p. 680].

Major changes occurred in the structure of supply and export volumes of such groups as machinery, equipment and vehicles. In the 1970s the share of those products in the structure of the Soviet Union exports exceeded 20%, although even then, that figure did not correspond to the structure of domestic production and was significantly lower than the global level (30%).
Russian exports of machinery, equipment and vehicles in 2013 was $ 1191750000, that was 18.5% more than the level of 2012.
The situation with the export of domestic engineering, design and installation services in recent years is not quite favorable. The volume of Russian exports of complete sets of equipment does not exceed $ 1 bln. at the moment. That is 20% less than the volume of technical assistance of the USSR in the 1980s. The main reasons for this situation are the actual Russian withdrawal from the equipment spare part markets in Eastern Europe, namely the former CMEA partners, as well as from the markets of the most developing countries which in its turn caused a sharp decline in public funding of this form of cooperation.
According to statistics, in 2014 in the trade balance of the country's the main partners were the EU countries (42.2% of imports and 53.8% of total exports), APEC (34.3% of imports and 18.9% of exports) and the CIS (13% of imports and 14% of exports) China and Germany being the largest.
According to the above statistics, it follows that if the nature of the sanctions is the most severe and leads to an economic blockade under which the country will cease to be introduced to strategically important resources Russia can face serious problems.
So in 2008 for example, during the Georgian-Ossetian conflict, Russian refineries stood out of work because they did not receive special additives for the production of gasoline [15, p. 195].
It should be stated that along with the heavy dependence of the Russian Federation on the countries of Western Europe there is a colossal dependence of European countries on the strategic needs of export deliveries of Russian energy resources. For instance the distribution of the volume of Russian oil sales is as follows: 67,5% to Europe, 16,85% to China and 6% to the US. According to the international distribution of oil consumption, directly in Europe the share of the Russian oil and gas companies accountes for 46,38%. Consequently, all the European community accepts and understands the fact that declaring Russian embargo and depriving itsell of energy is inappropriate and in the first place, is defective in respect to the European population. To restore the gas supply of European countries from other regions is impossible in a short period of time so from this point of view Europe is still a reliable partner. On the other hand the United States, being the main initiator of the sanctions is able to announce an embargo and stop buying Russian oil as its consumption is only 5% of the demand. To compensate for the loss of partners Russia can refocus energy flows to the India and Japan markets currently consuming less than 1% of Russian oil, to the Asia-Pacific markets currently consuming only 4% of the Russian oil as the basis of their consumption is the Middle East oil. Along with the consumption of strategically important energy resources from Russia the European economy depends on the purchasing power and high demand for the European goods among Russians in particular the European automotive industry, household appliances, medical services and so on. At the moment, the owners of many of the major European companies do not support the imposed sanctions against Russia [7, p. 322].
Gas industry in Russia almost entirely focuses on the European and CIS countries Europe is supplied with 64,70% of the Russian gas, the post-Soviet countries get 27,85%, the remaining part goes to Asia. Domestic commodity companies are completely dependent on the European gas market, but Europe has diversified its trade relations, the share of Russian gas in the structure of imports being just 34.46%, other suppliers are Norway and the Netherlands. The US uses gas from Canada and as economists have estimated, having taken the shale revolution into account expects Europe to consume the US shale gas. But for the majority of European countries the Russian gas is the most important component of imports (Table 2.). It will take time and money to switch from the Russian gas supplies to the US shale gas supplies as new port facilities, machinery tanker fleet shuld be installed, construeted and adjusted. The cost of shale gas is much more expensive compared to the Russian pipeline gas.

Table 2 - Dependence of European countries on Russian natural gas in 2014

Countries	The share of Russian gas in gas imports, %
Finland	100,0
Slovakia	92,7
Poland	82,6

Thus, the foreign policy strategy depends on the extent of foreign investment. A significant proportion of investments flows through the European offshore, both to Europe from Russia, and vice versa.
The data analysis on foreign investments in the Russian Federation, presented in Table 3, shows that the flow of investment from the United States is small and amounts to about 3%. On the other hand, if the US reduces its investments Russia is supposed to have great economic losses in the following industries: manufacture of coke and petroleum products (about 12% of US investment); manufacture of machinery and equipment (28.1% of the US investment).

Table 3 – The Volume of foreign investment accumulated by the Russian Federation in 2014

The Russian economy potential on the formation of import-substituting industrial policies is high enough.
One of the important directions of import-substituting industrial policy is to reduce the technological dependence on foreign suppliers. And although some companies have managed to create a competitive industry in the domestic technology market on the whole, the dynamics of creation and use of advanced production technologies does not allow to hope for a speedy result. Technology exchange is slowing down in Russia, thus the number of the advanced production technologies used in the manufacturing industry is being reduced. The amount of developed manufacturing technologies is growing, but in most cases these technologies, new for Russia, do not allow competitiveness in foreign markets.
The following factors objectively contribute to the implementation of import-substituting industrial policy:
- Positive stable dynamics of labor productivity;
- Financial stability of the country, which enables the implementation of a targeted industrial policy to stimulate domestic demand for domestic products and export of competitive industrial products over a long period;
- Deterioration of the macroeconomic environment, in particular the trend towards lower prices for energy that stimulates both import substitution and exports replace ment of low-level processing for products of a higher level of processing to increase the share of value-added and technological level;
- Russia's participation in the European and world "technology platforms", its involvement in global processes of technological exchange, which allows, if not to create new advanced manufacturing technology, then effectively replicate existing ones [8, p. 52].
Factors influencing the choice of strategic directions of import substitution development in different companies and industries are different, but they can be divided into two groups. The external uncontrolled factors include market forces (demand for domestic and foreign markets, competition in the industry), the system of state regulation of export-import transactions (the level of protection of domestic markets, the level of export promotion). The internal factors are the resources of the enterprise investment resources, production capacity, technology, skilled employees being among them and the system of enterprise management that is the system of strategic goals and objectives of the quality management system [10, p. 57].
Reserves for the efficiency increase of the company is the activity at the stage of import substitution production of individual or multiple elements of the product. The enterprise import substitution can be organized in one of two directions: the transition to the use of domestic analogs available on the market and the organization of domestic production of import-substituting elements.
The most important condition of import substitution is the ability to provide quality and recognition of domestic analogs on foreign markets, especially in markets abroad. At the same time it should be noted that there are differences in the perception of the level of quality in geographical terms. That is the level of quality which is acceptable for domestic consumption and consumers, for example, from the CIS countries, does not satisfy the demands of consumers, such as the EU, the US [2, p. 105].
The effectiveness of import substitution at the production stage is defined by the ratio of the effect resulting from the resources savings in terms of money when import-substituting element is used in the production taking into account the volume of production within the time interval scheduling (compared to the resources spent for the purchase of imported counterparts), to investment costs for the organization of its production [5, p. 414].
It should be noted that the organization of import-substituting products "from scratch" in today's economic environment is complicated by the lack of investment resources.
The production location of import-substituting products based on existing companies should become the most important direction of development of import substitution. The implementation of the strategy of import-substituting industries is possible in two main ways: with the focus on investment demand and with the focus on stimulating consumer demand [11, p. 225].
The Russian industrial enterprises can offer three options of import-substitution strategy: the strategy of internal-oriented import substitution, the strategy of external-oriented import substitution, strategy of mixed import substitution. Strategic directions of development of import substitution and identification of measures are reduced to determining the classifications of import-substituting products and target markets (Fig. 2).

Industrial Production Development Directions						
The leve implemer	Areas of impleme	Strategy	Model	The production base		Objects of in substitutio
Macro-leve	Oriented investm demand	Oriented to the domestic mark	On the basis of resources and technologies	On the basis of e production		products
Meso-level	Focused on consu demand	Oriented to the external marke	On the joint ven basis	On the basis of t newly created production		services
Micro-leve	Focused on consu demand	Combined	On the basis of and imported re and technologie	On the basis of e and newly creat production		Equipment, technology, raw materials, acces

Fig. 2. The system of classifications of alternative strategies of import substitution

Conclusions

Thus the basic principles of the implementation of import-substituting industrial policy in Russia are:
- reindustrialization, increase in the share of industry in GDP and advanced production from the technological point of view in the industrial structure;
- Stimulating domestic demand for industrial enterprises goods including "subsidies" of prices and the system of public orders;
- Long-term activities allowing to attract long-term investments;
- Keeping a high degree of openness of the economy. The development of cooperation with foreign partners in the areas of technological exchange, scientific cooperation and the creation of advanced manufacturing technologies. Keeping in mind that the creation of simulated restrictions on the import and export of technologies reduces the efficiency and competitiveness of products;
- State support of export of competitive industrial products.

To sum up the import-substituting industrial policy is a tool to improve the competitiveness of the national economy and ensure the economics security of the country.

Abstract

This paper presents tools of the government support of small business in different countries and in the Russian Federation. The purpose of the article is to show the desirability and features of models of government support in different countries. In this paper strategic map is proposed for the development of small enterprises and government support for small businesses is highlighted as the main direction of its development. This article also presents comparative analysis of the international experience of financing and support for small innovative enterprises based on monographic and statistical methods. Direction for creation of projects on public-private partnership is allocated as one of the main forms of the government support of small business.

Keywords: small enterprises, government support, strategic map of development, small business cluster.

Introduction

Small business is one of the most common forms of business organization at the present time, which largely determines the socio-economic development of the country. In constantly changing conditions of external environment, small business must quickly respond to those changes and continually adapt to new conditions to survive. The analysis showed that small enterprises generally have great dynamism and flexibility differences than big businesses. Success and durability of small enterprises positions determine the need for continuous improvement, as well as tracking, analysis and rapid response to changing conditions and parameters of business environment. The government regulates and supports through the use of effective tools and instruments of financial support, it will allow small businesses to gradually take more meaningful positions in shaping the country's economic indicators. In its nature, small business are based on local needs. Due to the smaller scale, small business turns out to be more flexible to changing economic conditions and are better able to respond to fluctuations in consumer demand. Small business significantly contributes to the formation of a competitive environment and market equilibrium. However, for the development of small business in an unstable and volatile external environment implementation of its government support is need.

Different scientists engaged in the study of the development of businesses, including small businesses - Joseph Schumpeter (Schumpeter J. A., 1982), David McClelland (McClelland, David C.,1978), Peter Drucker (Peter Drucker, 1989), Robert Hisrich (Robert Hisrich, 2013) and others. But some practical and methodological issues remain unresolved, and that fact determines the theme of research within this publication.

Results and Discussion

1. In developed countries, a system for classifying businesses to small businesses is based on a combination of quantitative (number of employees, revenue, etc.) and qualitative (legal independence, control systems, administrative procedures and technology) criteria (Figure 1). In Russia the European model for classification of enterprises to small business is used. So in Russia, as in the EU, the required additional condition is introduced - the limit of the size (no more than 25%) of the share in the authorized capital or voting rights for other individual entrepreneurs and legal persons (except for public investment, venture capital funds, institutional investors). In the legislation of Russia, as in the European Union, the criteria of

sales (proceeds from realization of goods (works, services) excluding value-added tax) or the balance sheet (balance sheet value of the assets for the preceding calendar year) are considered, however, in the EU the values of this criteria are equal only for small businesses.

Analysis of international and domestic experience of selection criteria of enterprises to small businesses, it should be noted that before 2008, the American model was dominated in Russian Federation, and since 2008 – the European model. The main difference between these models is that in the American model for each economic activity there is own and sole criterion or the number of employees or average annual revenue. The European model for all sectors of the economy imposed uniform criteria for classification of enterprises to small business, this includes the number of employees, and sales volume (or balance sheet), as well as an additional condition.

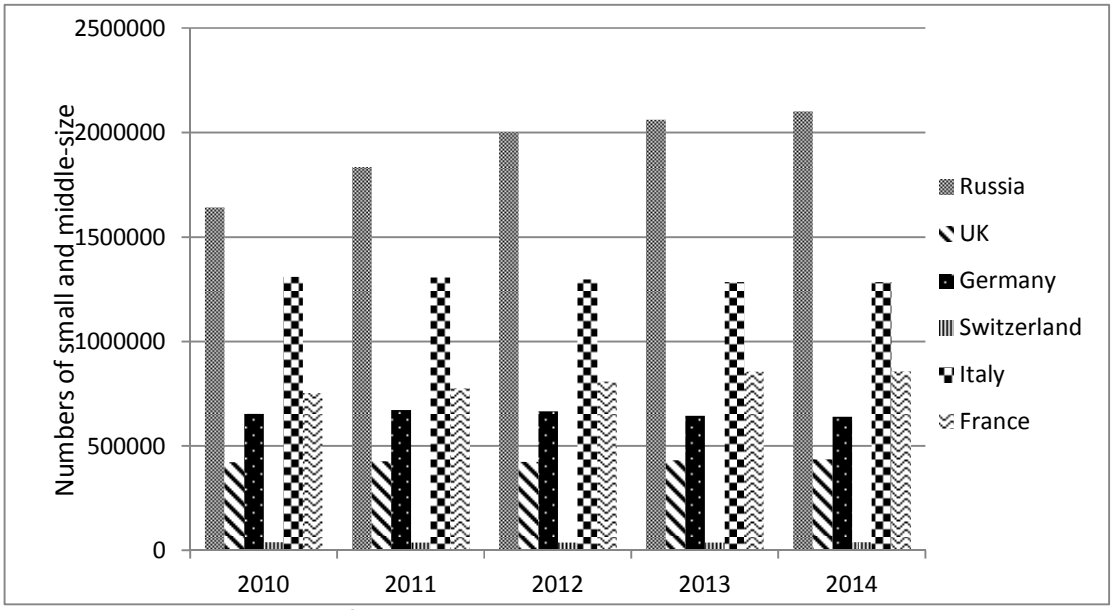

Fig 1. Numbers of small and medium-sized enterprises in Russia and EU

Source: statistic data

2. For effective management of small business and selecting priorities for government support we offer to comprise a strategy map for each direction based on the strategic goals of the company. Small enterprises strategic management process includes financial and non-financial performance indicators, set of which is unique for different businesses. Currently in practice the model of balanced scorecard (The Balanced Scorecard, BSC, by Kaplan, R. and D. Norton, 1996) is widely used, which includes material and static (concepts, structure of interdependence) and process-oriented (guidelines for the development, implementation and support of, the sequence and timing of action) components. Basic (classic) BSC structure has four projections: finance, customers, internal business processes, learning and growth (or staff). The purpose of the BSC is to address several strategic issues: assessment of trends and strategic initiatives; identifying new areas for growth; harmonization of strategic and tactical tasks; monitoring the achievement of the objectives; decision-making of tactical and strategic level.

The main task of the development of small enterprises in accordance with the balanced scorecard is to increase profitability; in that case the strategic map of small business can be defined as the integrated scheme of interaction of all four projections BSC (Figure 2) (Plotnikov, Vladimir and Leontyev, Evgeniy, 2015).

3. In all countries the government support for small entrepreneurship forms is different, as the system support measures, and the degree of its maturity. It is based on fact, generally, that the system of measures of the government support of small entrepreneurship, occurring in every country, formed under the influence of specific historical factors and should be clearly linked to the features of economic, political and social reality in the country. However, their main characteristic is orientation towards the effective stimulation of small business, activity of small enterprises to create competitive environment, assist in providing of small businesses with all the necessary financial, material and human resources.

Thus, the United States has one of the most effective systems of governmental support for small entrepreneurship sector. The main institution of such regulation is The U.S. Small Business Administration, which is in the sphere of influence of the Federal Government of the United States. In addition to the active financial support of small business, based on grants for small firms on permanent basis, loans on preferential terms and their safeguarding, promoting venture capital, SBA provides an extensive system of measures in promoting small enterprises receiving government order, the provision of advisory services and training.

Based on our study it is revealed that the American economy uses SBIC as an efficient system of support for small business. SBIC is a kind of public-private funds private equity, including venture capital, in which a significant portion of the capital (to 75%) is formed at the expense of public funds, and the management has extremely private nature, is no different from any venture fund with fully private capital.
Another effective system of support for small business is the system in Great Britain (European model), the core of which is the Small Business Service and the Federation of small businesses. Small business service

decides on the approval of loans issued to small firms. A key feature of the UK's budget policy in support of small business is mild progressive profits tax scheme for small businesses.
In China (Asian model), as well as in western countries, there have been at least an effective system of support of small business. Policy development in the field of support of small business is exercised by the National Development and Reform Commission (similar to the Russian Ministry of economic development) (Table 1).

Table 1: Comparative analysis of international funding and support experience of small innovative enterprises

Comparison criteria	**European model**	**Asian model**	**American model**	**Russian model**
Government support of small business	Credit institution to restore	Small business finance corporation	Small business administration	Regional centers of the government support of small business
Mechanisms for the promotion and development of small business	Direct financing	Direct financing is not provided	Direct financing	Direct financing
	Free loans	Free loans are not available	Free loans are not available	Reimbursement of expenses for registration of first business
	Earmarked subsidies for research and development	Earmarked subsidies for research and development	Earmarked subsidies for research and development	Microfinance (Surety)
	Innovation funds	Innovations are carried out directly by the participants of the innovation process	Innovation functions are exercised by specialized scientific and technical organizations	Functions of innovation financing are saved for Russian Foundation for technological development

Within this structure has a Department of small and medium-sized businesses, which implements all the planned programs to stimulate small business. Other small enterprises support center is China Center for business cooperation and coordination, which study the conditions of small business in the country, and then on the basis of research data forms development of services to facilitate life for small businesses.

Small business support system in Russia is composed of organizations that provide support. It is worth

emphasizing that this system includes both commercial and non-commercial organizations created as contractors, as well as placing orders for execution of works to meet the public's needs. In addition, this combination of organizations includes various business support funds, guarantee funds and guarantees, investment funds to attract funds, business incubators, science parks and other organizations.

The majority of scientists and practitioners in the sphere of management notes that the approaches to government support for small entrepreneurship vary considerably in different countries, so it is almost impossible to allocate a single approach suitable for all countries. We agree with this thesis, however, studying of this experience and subsequent implementation in country regulatory and incentive measures for small firms on the basis of such analysis is seen as the real business climate improvement scheme (Table 2).

Source: Ranking of Doing Business, http://russian.doingbusiness.org/rankings

In Russia nowadays, there are many different small business tools of government support. Firstly, financial support for small businesses is realized through the allocation of budget funds for small business development.

Secondly, stimulating the development of this sector is carried out with the help of simplifying licensing, certification schemes, as well as taking part in various exhibitions and promotional campaigns; government authorities widely practiced the issuance of grants to small enterprise development.

Government financial support in Russia mainly turns to young entrepreneurs who have already experienced the initial stage of their formation. In such a situation, the young enterprise is available to series of consultations in the sphere of financial activities, as well as some jural advice, which are coordinated by employment centers, the Ministry of health and the Ministry of economic development and trade of the Russian Federation. It is worth noting that the already existing government programs to support small business allow many entrepreneurs receive assistance in the form of grants, preferential loans, consultations and through other mechanisms to support small and medium-sized businesses.

Public organizations mainly provide an opportunity to influence on the legislative initiatives concerning

small businesses, help to establish relations with foreign partners and provide jural protection.

Guarantee funds facilitate lending. They provide guarantees on bank loans and implement the surety. In addition, the funds provide their services in the field of leasing. Business incubators provide small businesses the possibility of placing on the territory of "incubator", that gives these organizations certain benefits, such as free office and consulting services, affordable rental price.
In Russia, support of small enterprises is realized on more than 1000 organizations, forming the infrastructure, and on the positive side, it should be noted that in virtually all constituent entities of the Russian Federation centers for enterprise development are established. In the part of the individual items of infrastructure density, we note, that one of the most common are business incubators, which accounted for 12.6%, playing an important role in the development of starting business. The latter is confirmed by the fact that in the world practice in business-incubator survive up to 85% of newly created small enterprises, whereas without the assistance of such only 14-30%. Other dominant institutions represented by leasing companies and consulting centers, which accounted for 12.5% and 14.0% respectively. Centers promoting innovative business are slightly represented: science parks and industrial parks, which have been established in 22 subjects of the Russian Federation in total 3% of infrastructure organizations.

In Russia the commercialization of the results of intellectual activity, during the transition to the innovation way of development, many of which accumulated budgetary institutions, educational and scientific spheres, is the matter. The central place in resolving problems indicated Federal law takes No 217-FL, which aims to solve the problem of low economic return of research results in budgetary institutions of science and education institutions of the Russian Academy of Sciences. The law creates a jural basis for the introduction of the results of innovation activity, the exclusive rights on which belong to universities and research institutes.

However, experience gained since the start of the program shows that, the implementation of this law poses a number of challenges. During the analysis of leading Russian scientists research materials, the main obstacles for the effective development of small innovative enterprises in the scientific-research and educational institutions in Russia were identified (Fig.3).

Government instruments, forming organizational-legal maintenance of small business activity, currently are working quite effectively, as evidenced by the implementation of the provisions of the relevant legislation, and their wide availability for research groups, that in turn allows us to speak about the quality of the created conditions for their stable operation. However, researches of domestic economists show that the most acute small business problems run into insufficient financial resources for the maintenance and development of activities and an essential key to positive dynamics of the studied cluster to achieve public purposes is a set of financial and economic instruments.

In 2015, in accordance with the Decree of the President of the Russian Federation "About measures for the further development of small and medium-size enterprises" and the Federal law "About amendments to certain legislative acts of the Russian Federation on development of small and medium-size enterprises in the Russian Federation" was founded JSC "Corporation "SME", which will work as the government institute of the small and medium-sized business development.

In the framework of the program, funds, earmarked on a competitive basis, are distributed among the regions for the implementation of the activities envisaged under regional programs to promote small and medium-sized business, provided co-financing costs by region. This approach allows you to supplement the federal budget to attract funding, and also encourage regions to implement a more active policy in the field of business support (Plotnikov, Vladimir and Vertakova, Yulia, 2015).

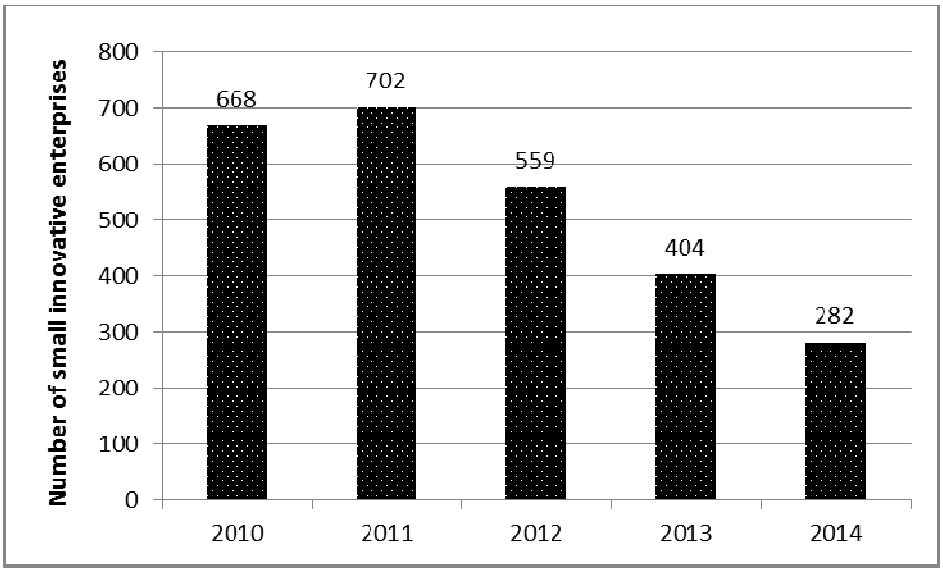

Fig 3. Dynamics of forming small innovative enterprises by the scientific and education subjects
Source: statistic data

Within the framework of the activities of JSC "Corporation "SME" these tasks will be concluded:
1) provide financial, infrastructure, property, jural, methodological and other support to small and medium-sized businesses; 2) raising funds from Russian, foreign and international organizations for the support of small and medium-sized businesses; 3) organization of information, marketing, financial and jural support of investment projects implemented by small and medium-sized businesses; 4) organization of activities aimed at increasing the proportion of procurement of goods, works, services of certain types of legal entities from subjects of small and medium-sized businesses; 5) interaction with the government of the Russian Federation, local self-governments, other subjects and organizations in order to provide support to small and medium-sized businesses; 6) ensuring improved measures of government support of small and medium-sized businesses.

JSC "Corporation "SME" will perform a system integrator support measures for small and medium-sized businesses.
In the Russian Federation there are following measures of the government support of small and medium-sized enterprises:
1) measures to ensure the financial support of small and medium-sized enterprises;
2) measures to develop support infrastructure small and medium-sized businesses;
3) special tax regimes, simplified rules for tax accounting, simplified tax return forms of individual taxes and fees for small businesses;
4) simplified accounting methods;
5) simplified procedure for compiling statistical reporting by small and medium-sized enterprises;
6) concessional payment for privatized public and municipal property by small and medium-size enterprises;
7) participation of the small entrepreneurship subjects as providers (performers, contractors) in the procurement of goods, works and services for public and municipal needs;
8) measures to ensure the rights and legitimate interests of subjects of small and medium-sized enterprises in the implementation of government control (supervision).
In particular, measures for support of small businesses are presented in table 3.

Table 3: Measures of the government support of small business in Russia

Provision of subsidies for:	**Concessional loans**	**Formation of business incubators**	**The holding of competitions**
1. Reimbursement of a portion of the costs associated with contracts of financial rent (leasing) 2. Reimbursement of a portion of the costs associated with the payment of interest on credit agreements 3. Reimbursement of a portion of the costs associated with the acquisition of equipment to build and (or) development, modernization of the production of goods 4. Refund of a part of expenses on energy efficiency programs 5. Reimbursement of a portion of the costs associated with obtaining certificates, including international 6. Reimbursement of a portion of the costs associated with participation in exhibition events 7. The provision of certain services or activities (e.g., the creation of tourist accommodation, leisure groups of preschool children, the creation and development of pre-school education centers, folk crafts, car purchase, etc.) 8. Stimulate the development of franchising in the sphere of small and medium-sized businesses 9. Starting subsidies for start-ups entrepreneurs	1. Incentive program of crediting of small and medium-sized businesses from JSC Sberbank. 2. Preferential loans for the development of small and medium-sized businesses from SME's Bank 3. Preferential loans from the Bank of Moscow etc.	1. Rental of premises at a reduced rate. 2. Consulting services. 3. Jural protection. 4. Training, provision for using of office equipment, negotiations, etc.	"The best in the small and medium-size business. "The leader of the small and medium-size business sphere", etc.

Government support for small enterprises is carried out through subsidies from the federal budget to the budgets of the constituent entities of the Russian Federation for reimbursement of a portion of the cost of interest on bank loans, and loans obtained agricultural credit consumer cooperatives of private farms, citizens, leading a personal part-time farm, agricultural consumer cooperatives (except for credit) (Polozhentseva Yulia and Klevtsova Maria, 2015).

4. Public-private partnerships can be extremely effective in the framework of the implementation of the strategy for the development of innovative type of economy. This model involves the effective assimilation of scientific and technological innovation (innovation), new technologies, products and resources, as well as the implementation of the organizational and institutional projects in the sphere of national reproduction. Innovative development becomes not just a product of the functioning of the government, but also achieved through the prism of reconciling the interests of the overall vision of the prospects for science and innovation sphere, its place in the economic system of society, representatives of different segments of the economy and social strata. The most modern and promising institutions of PPP in Russia nowadays are: - Investment Fund; - Development Bank; - public corporations; - special economic zones; - Russian venture company; - concessions (Vertakova Yulia, Polozhentseva Yulia and Klevtsova Maria, 2015).

In foreign practice characteristic of PPP's forms is based on the criteria of clear distribution of responsibility: who and what are the functions of partnership members will perform, who does provide the

resources, who and how does control the use of shared resources and the resulting from joint activities of income and its distribution (Fig.4).

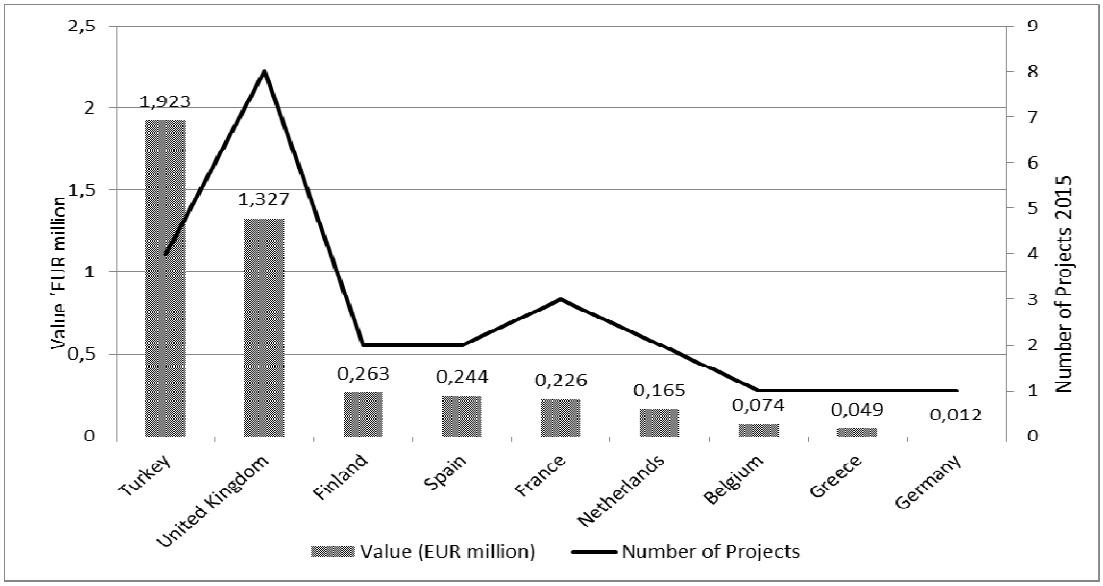

Fig 4. European PPP market in 2015

Source: European PPP Expertise Centre, http://www.eib.org/epec/

According to the European PPP Expertise Centre in the first half of 2015, there is a high level of financing public-private partnership projects in Turkey and the United Kingdom.

Therefore, public-private partnership can be described as strategically important government and business alliance aimed at effective implementation of socially significant projects and programs in a wide range: from economy, science and education to health and culture, capable of promoting the transition of the Russian economy to an innovative type of development. Obviously, this would require to develop specific mechanisms of co-ordination of interests of government, business, science, education and society in order to make optimal and rational attract different resources and their sources, as well as the corresponding adjustment of the Russian jural base. Therefore, to address these challenges, in particular, it would be useful to develop and implement the following activities:

firstly, for qualitative realization of priority national projects and programs to generate meaningful public-private partnerships as an effective mechanism for the integration of public and private resources and their sources for the development of national economy;

secondly, the form and structure of the PPP moreover can be formed on the basis of the existing resource potential of the national and regional economies of Russia, as well as taking into account the patterns and trends of development of the world community;

thirdly, depending on the availability of resources, as well as the factors and conditions of its formation, it is necessary to carry out a qualitative study of internal and external environment of the national economy with a view of developing a set of strategic priorities and directions of innovative development, including through interregional interaction. This requires that these elements are combined with the economic interests of independent economic agents (firms, enterprises, corporations, etc.), as well as the institutions of science and education.

Conclusions

Based on this analysis, we can conclude that the system of government regulation of small business is disjointed, mechanisms of interaction between the State and business representatives on the issues of financial support, tax and priority support areas for development are not fully developed. Currently the basic principles of the financial regulation of small business, financial support instruments are not formulated; there is no method for estimation of efficiency of public financial support for small businesses. Therefore, support for small business needs to be carry out through the conduct of socio-economic, financial and monetary, structural and investment and science and technology policy through the development of targeted programs of tax and tariff policies, system procurement, grants, loans, guarantees, information and marketing collateral.

Thus, the Russian Federation provides for the establishment of investment companies such as SBIC, which should become the main instrument of the government of the Russian Federation in promoting the development of small enterprises.

Small business gradually took a stable leading position in the economy, the most to adapt to crisis situations in the world economic system. The main form of operation of small businesses should be self-development; public participation in the future should be limited to the task of creating a favorable external environment. Public administration small business development at the level of the territory should contribute to the revitalization of the supply and demand in commodity markets, the creation of the required number of new jobs; should reduce the social pressures on the budget. The economic, political and legal conditions affecting the development of small business, certainly, in the greater part are determined by the legislation of the country.

We offer to management of small telecommunication operators organizing activities for the development and implementation of methodologies to analyze management efficiency in external and internal environment conditions, the results of which it is advisable to take into account on making management decisions, and the implementation of the proposed activities will achieve the necessary sustainability indicators of enterprises. In our view, the method of analysis of management efficiency of small enterprise telecommunications industry should be developed in the context of the impact of significant factors of internal and external environment, to take into account all peculiarities of the enterprises of such class (specifics of the industry sector, dynamic business environment, the need for a detailed decomposition of enterprise infrastructure, etc.) to give the company forecast for rational decision-making.

The government support of small business is especially necessary in the crisis so as to ensure that its activities will enhance employment and alleviate the negative impact of the crisis on the economy.

Acknowledgments

This paper was carried out within the state scientific task No 26.2671.2014/K "Theoretical and methodological basis for the development and implementation of a cluster-based policy at the regional level and scientific and methodological foundations of the tools of the structural benchmarks of the regional social and economic system".

Abstract

In 2014-2015 a number of additional problems connected with financing of Russian organizations came to light. External restrictions (the sanction of the western countries) were added to the ongoing structural crisis in domestic economy. The sanctions inflicted by EU countries and the USA substantially affect the sphere of financial provision of the Russian organizations and limit their presence in the international financial markets. Closing of channels of external financing not only aggravates the problem of the financial market, but also threatens prospects of long-term investment growth and development of Russian organizations.

This article describes the features of financing of Russian organizations which have developed under the influence of the crisis in the domestic economy in 2014 -2015 and economic sanctions against Russia.

Keywords: financial resources, external financing, economic sanctions, sectoral restrictions.

1. Introduction

In 2014 - 2015 in the Russian economy signs of economic instability and the crisis phenomena began to be more visible. Together with reduction of prices of raw material resources, strategically important for the Russian economy, there was a falling of national currency, inflation acceleration, reduction of the real income of the population, decrease in GDP growth.

At the present time the economic development of Russia and leading countries of the world, is determined by the background and nature of the global crisis that began in 2008 and continues to the present. The crisis in Russian economy is occurring due to the strengthening of economic and financial sanctions of the USA and the EU inflicted against Russia since 2014. As a result, Russian organizations have serious problems locating financial resources. The plausible solution is connected to the development of the financial and credit system of Russia.

2. Macroeconomic conditions, which have determined the formation of external funding of Russian companies before the economic sanctions introduction

The crisis folding at the current time in domestic economy has some specific characteristics. In 2014 - 2015 Russia faced simultaneous manifestation at once several crisis a component, the most essential financial resources from a position of providing organizations are cyclic (internal conjectural) and external (Mau V. (2015)).

First of all, the current crisis is the internal cyclic crisis connected with change of level of a business environment within the country. From the financial point of view, there are some characteristic signs of it: 1) decreasing growth rates of investments into fixed capital during several years (Figure 1); 2) delay of growth of the bank credits to non-financial sector (Figure 2); 3) growth of share "bad" debts at Russian banks.

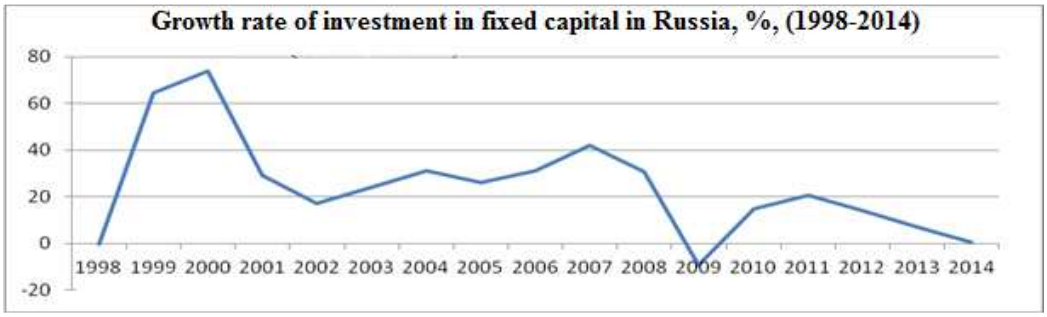

Figure 1. – Rate of a gain of investments into fixed capital in the Russian Federation for 1998 - 2014, % (http://gks.ru)

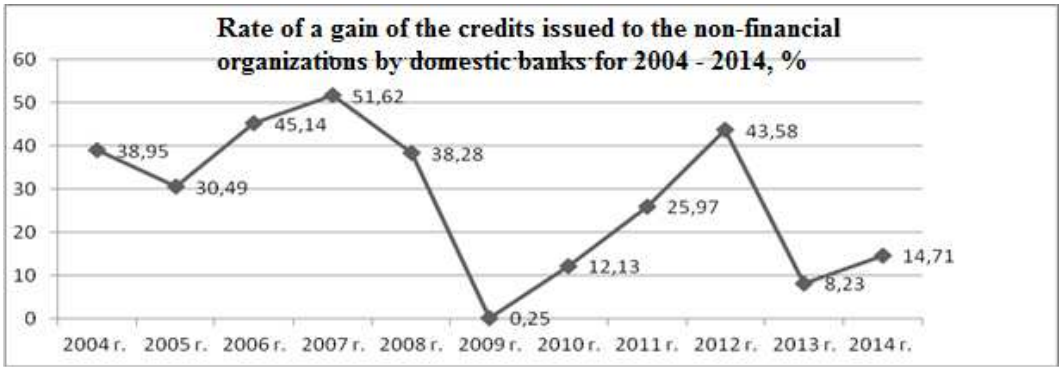

Figure 2. – Rate of a gain of the credits issued to the non-financial organizations by domestic banks for 2004 - 2014, % (http://cbr.ru)

Delay of growth of bank crediting domestic companies is connected, first of all, with growth of interest rates on loans (Figure 3).

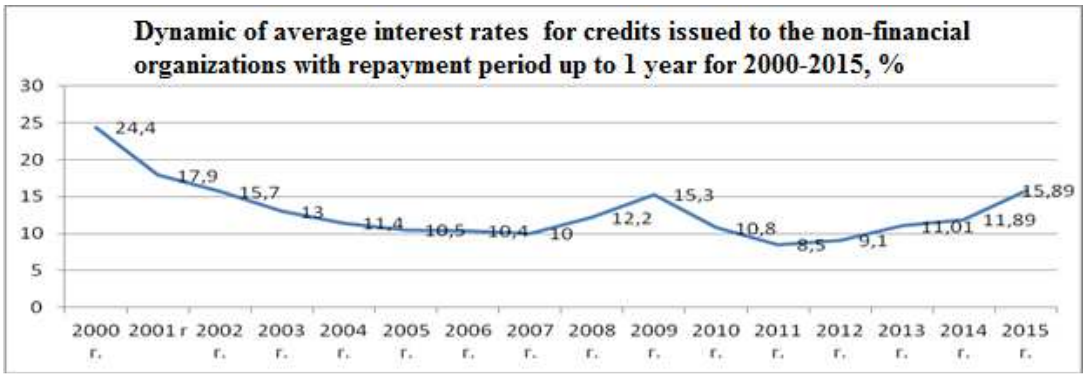

Figure 3. – Dynamic of average interest rates for credits issued to the non-financial organizations with repayment period up to 1 year for 2000-2015 (http://cbr.ru)

Growth of rates on the credits to the non-financial sector organizations is, on the one hand, a consequence of the Central Bank of the Russian Federation policy in the direction of in-crease of key interest rate. On the other hand, the high level of interest rates is caused by continuous decrease in volume of liquidity in economy* (Yershov M. (2014)).

Aggressive dynamics of interest rates for the credits to the non-financial organizations is explained by deterioration of a credit portfolio of Russian banks. According to the Central Bank of the Russian Federation, in structure of bank assets has been observed growth of arrears on the credits issued to the non-financial organizations for the period since 2009 till 2014 (Table 1).

Table 1 – Arrears on the credits issued to the non-financial organizations from 2009 for 2015 (http://cbr.ru)

Years	2009	2010	2011	2012	2013	2014	2015
Volume of arrears, million rubles	607,313	664,694	753,756	850,579	883,538	1,030,497	1,634,256
Rate of a gain of arrears in relation to previous year, %	-	9.45	13.39	12.84	3.87	16.63	58.59

Banks continue to fix the considerable volume of problem debt that is connected with prolongation of the problem credits and their subsequent account on balance for a long time on the balances. The developed conditions force banks to toughen approaches to risk management, and as its tool to use increase of interest rates.

The current crisis is connected with change of an external economic environment. One of negative factors of the external economic environment is change in a trend of the prices of the raw material resources exported by Russia. Falling of prices for oil has reduced a share of financial resources to the federal budget that affected the volume of financing of the domestic organizations. Data on change of dynamics of investments into fixed capital of the organizations financed by receipts from the budget of the Russian Federation are provided in Table 2.

* Restriction of ruble liquidity is considered sometimes as the measure stabilizing the currency market as the ruble credits obtained by the organizations are used for purchase of currency that causes depreciation of ruble and reduction of currency reserves. In such conditions restriction of the provided ruble liquidity for economy in general can block inflow of speculative resources on the currency market. At the same time this measure should be applied extremely carefully as it also limits cash flows for all other types of ruble operations (the credits, deposits etc.) that negatively affects financing of the organizations of real sector of economy.

Table 2 – Investments into fixed capital of the domestic organizations financed by budgetary funds of the Russian Federation into % by the previous year for 2000 - 2014 (http://gks.ru)

Year	Rate of a gain (decrease), %
2000	67.6
2001	23.4
2002	14.4
2003	38.0
2004	-3.6
2005	71.2
2006	32.2
2007	61.3
2008	24.7
2009	28.6
2010	- 4.3
2011	29.2
2012	8.4
2013	9.0
2014	-7.6

Not less important factor having impact on change of financing terms of the domestic organizations is process of financial globalization. As its distinctive feature liberalization of the national financial markets acts. Together with possibility of attraction of financial resources from the international financial markets globalization of the Russian financial market provoked prompt outflow of financial resources from domestic economy. Data on volumes of the financial means which are taken out from the country are presented in Table 3.

Table 3 – Net export / import of the capital by the private sector (banks and other sectors) from 2000 for 2015, bln. dollars of the USA (http://cbr.ru)

Year	Net import (-), Net export (+)
2000	23.1
2001	13.6
2002	7.0
2003	0.3
2004	8.6
2005	0.3
2006	-43.7
2007	-87.8
2008	133.6
2009	57.5
2010	30.8
2011	81.4
2012	53.9
2013	61.6
2014	153.0
2015	56.9

Undoubtedly, capital outflow from the Russian economy significantly reduces possibilities of domestic financial and bank sectors as involves narrowing of money supply. Decrease in level of monetization in economy leads to the corresponding falling of investments and productions, to further deterioration of a financial position and, as a result, bankruptcies of the organizations of real sector (Glazyev Page (2015)).

Process of integration of financial systems and internationalization of the financial markets, promoted emergence and a wide circulation among the Russian companies of the depository receipts (DR) allowing to overcome national borders of stock market and to attract on national stock market the capital of foreign investors (Aseeva M., Gleba O. Azarnikova I. (2014). The Russian issuers issue two kinds of depository receipts: 1) American Depositary Receipt (ADR) which are traded only on stock market of the USA; 2) Global depositary receipt (GDR) which is traded on stock markets of any countries except the USA.

Active use of such financial instrument by the Russian companies as depository receipts, was connected with that it allowed issuers to bypass a ban and restrictions on export of actions abroad in own country and on free circulation of foreign securities in other countries. Release of depository receipts represented a convenient way to bring the securities to the markets of the developed states and to attract additional foreign investments.

Now more than 3000 depository receipts on the stock of various companies more than from 75 countries among which the important place is taken by Russia (http://bnymellon.com) are traded on the world stock markets. The main platforms where shares of the Russian issuers are placed, are: London Stock Ex-change (LSE), New York Stock Exchange (NYSE), Deutsche Boerse (DB).

The active entry of the Russian companies into foreign trading floors through of issue of programs of depository receipts was observed during the period from 2000 to 2007 (Table 4).

Table 4 - Dynamics of the ADR/GDR market on the shares of the Russian companies during the period from 2000 to 2007 (Zhdan A., Aseeva M. (2015))

Exchange	The annual trading volume of ADR / GDR on shares of Russian issuers, billion dollars.							
	2000	**2001**	**2002**	**2003**	**2004**	**2005**	**2006**	**2007**
NYSE	3.95	1.5	1.8	11.3	12.6	17.5	26.8	26.2
LSE	15.31	18.46	19.26	53.4	96.2	134.5	214.3	169.8
DB	10.27	3.66	4.2	4	4.9	12.4	19.7	17.9
Total	**29.53**	**23.62**	**25.26**	**68.7**	**113.7**	**164.4**	**260.8**	**213.9**

Trade in depository receipts on shares of the Russian issuers on LSE especially actively developed in the specified period. First of all, it was caused by lower expenses at their place-ment, and also more liberal requirements of LSE to issuers of the shares placed with use of pro-grams of depository receipts.

New level in development of trade in depository receipts was reached by the Russian companies during 2009-2011 (Table 5).

Table 5 - Dynamics of the ADR/GDR market on the shares of the Russian companies during the period from 2009 to 2014 (Zhdan A., Aseeva M. (2015))

Exchange	The annual trading volume of ADR / GDR on shares of Russian issuers, billion dollars.					
	2009	**2010**	**2011**	**2012**	**2013**	**2014**
NYSE	66.91	81.3	52.85	53.53	36.42	32.63
LSE	407.3	538	419.64	356.86	242.8	217.52
DB	56.74	58.6	42.16	35.68	24.28	21.75
Total	**530.9**	**677.9**	**514.6**	**446.07**	**303.5**	**271.9**

Since 2011 negative dynamics of trade in depository receipts on shares of the Russian issuers which is connected with introduction against them economic sanctions, and also with deterioration of the general economic situation in the country was observed.

Thus, even before introduction of economic sanctions in 2014, in the Russian economy the internal and external tactical conditions limiting possibilities of use of external financing (mainly bank crediting) by the domestic organizations already developed.

3. Influence of the economic sanctions imposed by the EU and the USA on conditions of attraction and use of external financial resources by the Russian organizations

In 2014 the external sanctions of the western countries were added to the above-named negative factors in the Russian economy.

The economic sanctions directed against Russia have various reasons, structure and mechanisms. Characteristic of these sanctions is their dot orientation, i.e. restrictions are imposed not on the state in general, as on uniform geoeconomic subject, but on certain residents of the country: commercial structures and some individuals (http://weic.info, http:// nauchforum.ru).

In general sanctions can be grouped as follows (Table 6).

Table 6 – Group of the economic sanctions imposed by the EU and the USA on object of influence (Perestukin A. (2014), Orlova N. (2014), Klinova M. (2014))

Sanctions	Object of economic sanctions
Sanctions, according to the SDN list (Specially Designated Nationals) ("specially certain companies or natural persons")	Mainly the largest defensive organizations of Russia got to this list. These sanctions assume rigid restrictions because they forbid registering currency payments in advantage or on behalf of the companies. Persons from the USA or connected with the USA are forbidden to perform operations with the persons specified in this list, and all assets of these persons in the American jurisdiction are blocked. Financial risk becomes be the main risk which assumes that all calculations in dollars are traced by the USA. The companies which underwent sanctions can keep accounts only in the Russian banks against

	which there are no sanctions.
"Sectoral" sanctions ("SSI list" (Sectoral Sanctions Identifications) of the American Management on control of foreign assets (Office of Foreign Assets Control (OFAC))	The "sectoral" list includes the Russian banks - VTB, Bank of Moscow, Rosselkhozbank, Gazprombank, Vnesheconombank state corporation (VEB), the Novatek and Rosneft companies. All restrictions extend also on the companies in which belongs to the companies from the "sectoral" list 50% and more shares. The main restriction of the sanctions inflicted on banks and the enterprises is the ban of their entry into the debt markets of the USA and Europe acts, but they can register the payments or payments of the clients. The cooperation which isn't connected with new financing, and operations with securities which are already circulating on the market are allowed. The ban concerns also all companies which own or which are under control to these organizations.

Introduction of "sectoral sanctions", according to the SSI list, assumes certain restrictions on actions of the persons cooperating with the Russian companies (Table 7).

Table 7 – Allowed and forbidden actions concerning the Russian companies which got under "sectoral" sanctions

Allowed	Forbidden
To purchase and sell the existing shares, ADR/GDR and bonds of the companies from the "sectoral" list.	To invest in new issues of bonds of the companies from the "sectoral" list, to grant them the new loans more than 90 days. To refinance the existing debts of the companies if it means extension of the credit more, than for 90 days
To invest in future share issues of JSC Rosneft and JSC Novatek, to participate in the organization of such placements.	To invest in new shares of "VEB", "Gazprombank", "VTB", "Bank of Moscow", "Rosselkhozbank" (if those are let out)
To provide financing to the companies from the "sectoral" list no more than 90 days	To render any services connected with release of new debt obligations "VEB", "Gazprombank", "Rosneft", "Novatek" including the organization of placements
To support correspondent accounts from "VEB", "VTB", "Gazprombank", to provide them settlement and clearing services	
To trade in derivatives on the shares and the bond (futures, options, credit and default swaps of CDS) of the companies from the "sectoral" list irrespective of a date of issue of the papers which are the cornerstone of the derivative tool	
To continue the commercial cooperation with the Russian companies which isn't assuming providing new financing to them	

Source: Management on control of foreign assets of the Ministry of Finance of the USA (OFAC), the analysis of RBC

The sanctions entered by the EU and the USA from the financial point of view are mainly connected with restriction of access of the Russian companies on the international capital market. First of all, possibility

of receiving the long-term financial resources coming to a turn of the domestic organizations in the form of the foreign credits and issue of securities is blocked.

According to data of the Central Bank of the Russian Federation, the corporate sector of the Russian economy for the last several years actively increased volumes of external debt (Figure 4) (http://cbr.ru).

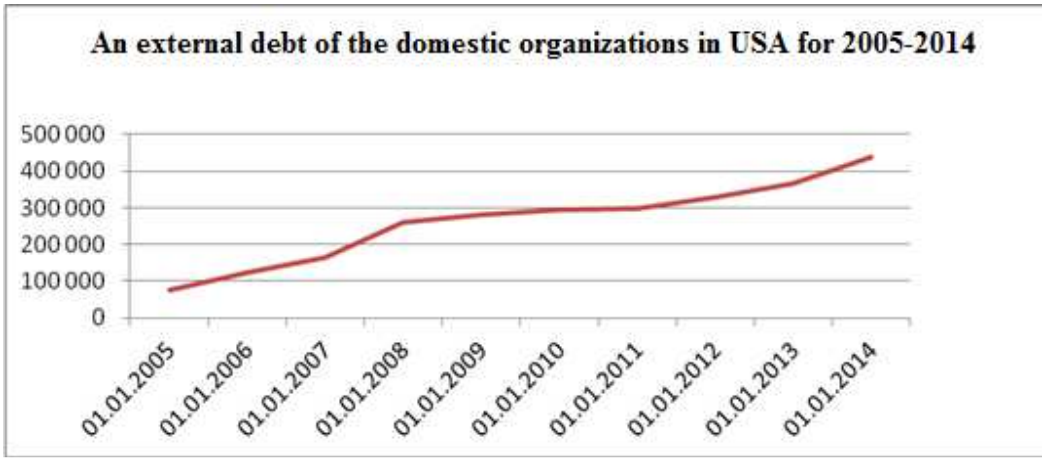

Figure 4 – An external debt of the domestic organizations for 2005-2014

As of 01.01.2014 the external debt of the Russian corporate sector made 651.16 bln. dollars of the USA, for 01.01.2015 – 546.84 bln. dollars of the USA (http://cbr.ru). The essential volume of an external debt and high specific weight of obligations to nonresidents in the general structure of debt are characteristic, generally for most large exporters that is caused by the following reasons: 1) the companies prefer funding in foreign currency for "natural hedging" when the debt share in foreign currency approximately corresponds to its share in revenue; 2) financing cost in foreign markets for the companies having an investment rating, in general, lower, and financing terms – is longer.

The main borrowers in foreign markets are the companies of oil and gas branch. On 01.10.2014 not less than 3.2 trillion rubles that made about 20% of the total external debt of non-financial sector of the Russian economy were the share of three largest Russian oil and gas companies. For the largest oil and gas companies the share of an external debt in the general structure of their debt obligations made 84%. This indicator is the highest in comparison with other branches (http://cbr.ru).

With introduction of the restrictions connected with sanctions of the EU and the USA the Russian corporate sector became have the following problems:1) repayment of an external debt and, as a result, research of possibility of its refinancing was globally designated; 2) rise in price of loan financing; 3) need of search of alternative sources of debt financing.

According to the Central Bank of the Russian Federation, according to the schedule of payments of the largest non-financial organizations for obligations of external financing payments are distributed in time rather evenly: for 2014-2015 only 26% of volume of payments were necessary; the share of repayments falling on the period after 2019 makes 38%. This schedule of payments will allow the Russian companies to satisfy gradually an external debt, using own cash flows and attracting the loans at the Russian banks. The companies of oil and gas and metallurgical branches have a considerable short-term external debt where the share of payments until the end of 2015 made, respectively, 35 and 21% of a total debt. For other branches this indicator doesn't exceed 5 –7%, and the most part of payments fall on the period after 2019. Despite rather big payments until the end of 2015, the risks connected with payments of external obligations of the oil and gas companies by estimates of the Central Bank of the Russian Federation,

remained moderate. In general, "the Russian companies – exporters are able to satisfy independently external debts, using own operational cash flows and refinancing of debts in the Russian banks" (http://cbr.ru).

From March to September, 2014 against some of the Russian credit organizations and their subsidiary banks sanctions of the USA and the EU were imposed. On October 1, 2014 the external debt of the Russian banking sector was 192 billion US dollars (http://cbr.ru). The Russian commercial banks faced a problem of payment for external foreign liabilities. The main volume of an external debt fell on banks with the state participation. Thus the main volume of the planned repayment accounted for more than three years.

In September, 2014 the Central bank of Russia conducted survey of 30 largest credit organizations with the purpose to estimate their actual term structure of assets and liabilities in foreign currency. It was revealed that they had "the net buffer" of foreign currency (a difference between the volume of liquid assets and liabilities with repayment in the IV quarter 2014 – 2015) of 32 billion US dollars. By results of survey Central Bank of Russia confirmed that "in some banks there was a lack of liquidity in foreign currency due to the mismatch of assets and liabilities by maturity, but for the banking sector in general the problem of external debt refinancing is not a systemic" (http://cbr.ru).

Despite the positive opinion of the Central Bank of the Russian Federation on the payment of the external debt of non-financial organizations and financial sector, the payment of the external debt of the corporate sector can cause a decrease in the level of monetization of the economy and, as a result, the restriction of credit resources and increase of interest rates on loans. Besides, arrival on the Russian market of large commodity companies can complicate the process of obtaining credit resources for other domestic organizations..

The imposition of economic sanctions provoked also increase the cost of borrowing, especially for the long term, because the major share of 'long-financing' provided on the external market in previous years. In addition to a direct increase in rates for Russian borrowers an additional negative factor was the high exchange rate risk for loans in foreign currency. Raising the cost of lending, coupled with Exchange rate risk, firstly, reduces investment opportunities for companies; Secondly, it limits opportunities to refinance current debt of companies which imposes restrictions on their operations, as the current financial flows are diverted to repay existing debt.

Economic sanctions affecting the possibility of obtaining Russian banks available credit provoke investment recession in the country. With imposition of sanctions EU stopped financing of a number of the Russian investment projects implemented in cooperation with the European Bank of Reconstruction and Development (ERDB). Some of the measures, in spite of the opposition of Germany and France, affected projects with financial participation of the European In-vestment Bank (EIB).

The suspension of financing new projects in Russia public sector by the EIB has no such implications, as in the case of EBRD, for which Russia is the principal recipient of funds. EBRD shareholders are 64 countries, including Russia (4% of the share capital), and two intergovernmental organizations (the EU and the EIB). Since 2003, EIB has invested in projects in Russia 1.6 billion euro, in 2013 EBRD has allocated 1.8 billion euro and the total investment for all countries — clients of the Bank amounted to 8.5 billion euro. For the first half of 2014 19% EBRD investments fell on Russia, while the Bank lends 35 countries. As of 2014 the Bank participated in 792 projects in Russia, investing a total 24.4 billion euro. The amount of European funding programs of cooperation with Russia until 2020, according to the European Commission (EC) is about 450 million euro. Now the EU can cut it up to 275 million or even up to 98 million euro depending on the rigidity of the decision (Klimova M. (2014)).

With imposition of sanctions concerning Russia also the situation on the market of depositary receipts has changed. The sanctions regime, in fact, discredits the holders of depositary receipts of Russian issuers -

foreign minority shareholders. Introduction of sanctions to the Russian companies creates a risk of losing the asset and non-recognition of shareholdings through depositary receipt at the time of the imposition of sanctions Depositary banks may simply not to carry out orders in relation to sanctions companies.

Already there are some cases when the western banks – holders of the GDR – receive a direct ban from financial U.S. authorities to vote by their package at meeting of shareholders. In the conditions of sanctions regime risks of ownership of the GDR and ADR is significantly in-creasing. So, for the 'sponsored' (i.e. issued on the initiative of the issuer) ADR extension of sanctions can, with high probability, result in the automatic termination of their circulation in the organized markets (if they are admitted to them). This will lead to the risk of loss of liquidity and is likely to decreasing prices. If hypothetically assume that the depositary will forbid any work with the ADR, and their owners will have to re-register the shares in order to sell - there is possible risk of losses due to the spread. Besides, there is still very high risk of losses from the Russian countersanctions in case of deterioration of an international situation. In this case losses of holders of ADR can be up to 100% of their value. Under such circumstances, foreign investors will prefer invest in securities of other countries (not Russian). This will lead to a reduction in investments in securities of Russian issuers, including ADR and GDR (Figure 5) (http:// moex.com are justified; http:// sberbank-cib.ru).

Red - secondary trading in stocks, depository receipts and shares, bln. rub
Green- trading in shares, ADR and GDR at over-the-counter market, bln. rub

Figure 5 – Dynamics of trading volumes of shares of the Russian issuers during 2011 - 2015.

Conclusion

Thus, to summarize, it is possible to tell that the economic sanctions of the EU and the USA imposed in 2014 in many ways have exacerbated the negative and crisis processes developing in economy of Russia earlier. The suspension of obtaining external credit resources provided in the form of foreign loans and Eurobond issue and increasing the cost of external borrowing were major impacts to Russian organizations in terms of their financing. The volumes of financing of Russian organizations through issue of depository receipts have significantly decreased. Reduction and sometimes full suspension for obtaining long-term investment resources, which blocks the implementation of important investment projects, can be described as the most significant negative impact of sanctions.

Abstract

This paper describes the implementation of innovation in education at the University of West Bohemia (UWB) at the Faculty of Mechanical Engineering (FME). The main aim of these innovations is to introduce Project-Based Learning (PBL), which forces students to acquire deeper information about the issues that they are dealing with. PBL is playing an increasingly larger role in technical education all around the world, because this type of education is very advantageous for technical fields and so it is necessary to implement it effectively in our Faculty too. The aim of these innovations is primarily to enhance our students' practical knowledge and make teaching of technical subjects more attractive for students and thereby motivate more applicants to study at FME. 'Today there is a great need to enhance science and math education and to broaden the learning experience to make it more enjoyable.' (Snyder et al., 2014) Implementation of PBL is described here using the examples of reverse engineering and rapid prototyping. These two modern methods are used in engineering practice for digitalization of already produced parts and for production of prototypes. Students at FME have the opportunity to become acquainted with these unconventional methods during their study of certain subjects, within which they can deal with projects similar to those occurring in real practice. These specific subjects provide students with practically applicable know-how which is important for every engineer.

Keywords: innovation of education, project based learning, reverse engineering, rapid prototyping

Overview

The task of every university is to provide high-quality education and thereby deliver to the labour market graduates prepared for their future employment. But according to recent studies and feedback from industry this is not true. 'Today's engineering graduates need to have strong communication and teamwork skills, but they don't. They need to have a broader perspective of the issues that concern their profession such as social, environmental and economic issues, but they haven't. Finally, they are graduating with good knowledge of fundamental engineering science and computer literacy, but they don't know how to apply that in practice.' (Mills & Treagust, 2003) Despite the poor quality of graduates there has been a slight improvement in recent years. 'Technically oriented commercial companies themselves have also made a considerable contribution to this improvement, and are increasingly sending their specialists to lectures and seminars at universities in order to present, in addition to the theoretical fundamentals, practically useful skills. It seems that the key to success is the effective cooperation between practice and education. This should guarantee flexible adaptation of curricula to new trends.' (Petříková, 2014). 'It is clear that universities need to cooperate with engineering companies to produce highly skilled graduates.' (Hynek et al., 2013)

Alongside theoretical education it is also very important to learn and develop practical knowledge in technical fields, because this often determines the employment of graduates in the labour market. 'It is necessary to provide practical information and real applications in class to compensate for the lack of practical experience.' (Hynek et al., 2014) 'It can be said that the ideal engineer must possess sound knowledge of fundamental engineering principles and laws, and must be able to apply the knowledge and convert theory into practice.' (Nguyen, 1998) 'The need to ensure that students gain practical experience of real industrial environments during their studies is therefore extremely important.' (King et al., 2007) 'One of the most important factors in forming the engineering graduate qualities is the practical component of

the engineering curriculum. The professional engineering community expects engineering graduates to develop practical skills during their undergraduate educational experience.' (Nedic et al., 2003) Technical projects are often created on the basis of the solution of a comprehensive problem. The solution always includes a range of activities that are based on significant theoretical knowledge, experience and the practical skills of the investigators. One of the fundamental reasons for implementing Project-Based Learning (PBL) into learning is primarily the current trend in the application of modern teaching methods that are closely tied to modern technologies. 'The pedagogic concept of project-based learning is different from traditional learning in that it tries to develop students into active learners who actively acquire necessary knowledge to resolve problems that appear in the project, not as passive learners who always receive second hand knowledge.' (Thomas, 2000) 'The learning is dynamic as students use various processes and methods to explore the project. The project is generally information rich, but directions are kept to a minimum. The richness of the information is often directly related to the quality of the learning and level of student engagement.' (Capraro et al., 2013) This is why at our university within certain subjects we are extending the use of practical projects focused on real technical problems that students may deal with in their future professional life in any industrial company. Modern methods of rapid prototyping and reverse engineering were selected as suitable examples for describing the implemented innovations. These two methods will be used for explaining how students solve their project on the basis of PBL.

Reverse engineering

First, it is important to explain what reverse engineering actually means. 'While conventional engineering transforms engineering concepts and models into real parts, in reverse engineering real parts are transformed into engineering models and concepts.' (Várady et al., 1997) 'CAD (Computer Aided Design) models are often unavailable or unusable for parts which must be duplicated or modified. This is a particular problem for long life cycle systems for which spare part inventories have been exhausted and original suppliers are unable or unwilling to provide custom manufacturing runs of spare parts at affordable prices and in a timely manner.' (Thompson et al., 1999) The typical procedure of this method can be seen in Fig. 1.

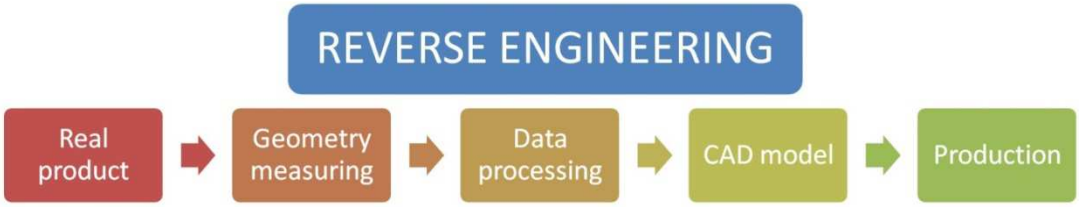

Fig. 1 – Reverse engineering

All of the steps shown in Fig. 1 include several options and methods that can be used to achieve the desired result, and it is only up to the students to consider what fits their project best. Using these basic steps, students will learn different methods and procedures used in measuring and obtaining information about geometry, working with specialized 3D software for editing data gathered from measurements, creation of CAD models, data preparation for further processing in the PC such as drawing documentation, machining programming, 3D printing, etc. At the end of the project students also have the opportunity to manufacture a final product and compare it with the assigned example model.

Rapid prototyping

Another modern method used increasingly in industry is rapid prototyping which applies the technology of Additive Manufacturing (AM) and uses 3D printing. 'Until recently, prototypes had to be constructed by skilled model makers from 2D engineering drawings. This is a time-consuming and expensive process.' (Pham & Gault, 1998) This outdated method of prototype production has largely been replaced by rapid prototyping. 'Rapid prototyping generally refers to techniques that produce shaped parts by gradual creation or addition of solid material, therein differing fundamentally from forming and material removal manufacturing techniques.' (Kruth et al., 1998) 'These technologies significantly improve the present prototyping practices in industry.' (Yan & Gu, 1996) 'Rapid prototyping initially focussed on polymers.

These were later replaced/supplemented by ceramics, metals and composites.' (Kumar & Kruth, 2010) Although 3D printers were originally intended exclusively for the production of prototypes, nowadays their use has expanded significantly. 'While currently used primarily to manufacture prototypes and mockups, a number of promising applications exist in the production of replacement parts, dental crowns, and artificial limbs, as well as in bridge manufacturing.' (Berman, 2012) It is clear that rapid prototyping will continue to play a significant role in industrial production and therefore it is necessary to also include this method in the teaching of technical subjects. 'Interestingly, community colleges have served as an excellent gateway for exposing students to AM techniques, and their courses tend to adapt to recent trends.' (Huang & Leu, 2014) There are several types of 3D printers at our university, so students have the opportunity to learn how to use these printers and determine all the possibilities and limitations of each type of printing. Rapid prototyping can also be used in reverse engineering under the section "production". The procedure for creating a component using rapid prototyping is shown in Fig. 2

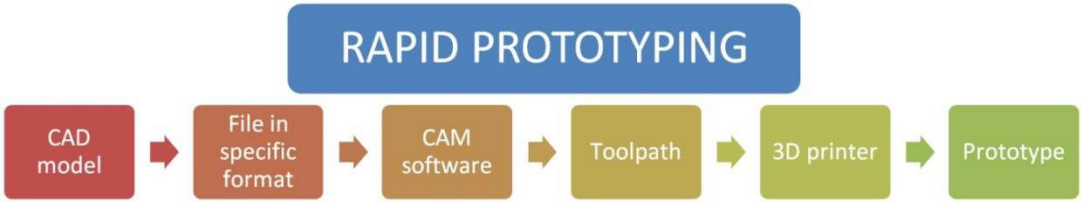

Fig. 2 - Rapid prototyping

Innovation of education at UWB

Innovation of education is being implemented at the UWB and FME for the improvement and modernization of education. One of the major trends in today's teaching is PBL. 'Effectiveness of Project-Based Learning is well recognized.' (Verma et al., 2011) 'In considering the enhancement of student interest to learn engineering and to further increase their positive attitude, influential factors ought to be considered in engineering curricula.' (Tseng et al., 2013) A number of projects were created for several subjects on the basis of this innovation at our Faculty. All projects were designed so that students could complete them in one semester. Project topics were chosen from a wide range of machines, equipment, tools and products. Each project always includes several disciplines, fields or specializations so it is always a very complex task. The simplified procedure for a sample project focused on reverse engineering is as follows:

- Student receives a part with complex shape for which an exact copy must be made on the basis of reverse engineering. At the same time the student receives a detailed assignment with all the requirements which need to be met.
- The first step is digitalization of the geometry of the received parts. The student has to choose the method of measurement according to the shape of the part and according to the requirements of the assignment.
- From the measurements the student obtains a point cloud that has to be cleaned from noise and also logically adjusted for compliance with the geometry of the part.
- By this process the student gains the required CAD model, which is further processed for final production of a copy of the specified components.
- The last step is the final production by selected/assigned technology. There is the option to use conventional machining methods or AM.

Via this process, students learn all the steps of reverse engineering and acquire practical skills in terms of digitalization of parts, CAD data editing and final production of parts.

Benefits for students

PBL means that students themselves must find and acquire information that is often much more extensive than information that could be given to students during traditional classes of individual subjects. 'Students must take responsibility for the learning process by setting goals, monitoring, reflecting, and sustaining

their motivation from the beginning of the project until the end.' (English & Kitsantas, 2013) 'Through practical activities, interactive discussions, independent operation and/or team cooperation, students reach the planned target and establish their own know-how.' (Tseng et al., 2013) Students gain practical know-how that is required from every graduate from a technical university. They also become familiar with modern technologies and procedures used in real industrial practice.

Conclusion

The aim of this article is to introduce innovations implemented at the UWB in the FME. These innovations include the effective implementation of PBL into teaching of several technical subjects. Projects in these subjects were created on the basis of modern methods that are increasingly widespread in technical practice. The methods described in this paper are rapid prototyping and reverse engineering. These innovations have been created on the basis of the need to enhance the quality of teaching and increase the quality of the graduates from our Faculty. Another reason was to make these disciplines and subjects more attractive and increase the number of applicants.

Šimon Pušman, University of West Bohemia, Pilsen, Czech Republic, pusmans@kks.zcu.cz

Abstract

Motivation is the most important thing in education. Without hesitation it can be said that success or failure of studies depends mostly on it. The presented paper is research in progress that is focusing on motivation in the education system. The main points of interest are the student, the teacher and the relationship between them. The aim of the article is to provide teachers with suggestions for key areas that are important and, at the same time, to highlight errors that many of us are making without realizing it.

Keyword: motivation, higher education, learning success, student, teacher

Introduction

'Motivation is love: love to do something or to have something. It is a driving force to carry out actions a person likes or desires' (Teo, 2010). From birth we are affected, or more accurately, educated, by our parents. After a few years, this role is largely transferred to the teacher for a long period of time. Therefore it is necessary to focus on the motivation of the student and the importance of the relationship between the student and the teacher (Abrami, Perry and Leventhal, 1982; Klem and Connell, 2004).

Student

Students are the cornerstone of the educational system and they are important for the labour market too. We must realize that students represent not only themselves but also their university. Therefore, any invested energy is beneficial in the long run. Unfortunately, there are many factors that affect motivation and student achievement.

Important factors include study habits and time spent learning (Nonis and Hudson, 2009). These two habits are learned constantly with each year spent in high school. The big difference for many is the transition to college. Many students cannot handle the freedom of study, optional attendance and only fixed submission deadlines. This means they might gradually lose their learned habits, with the result that the student does not go to lectures, does not have their own notes, making it harder for them to learn from other notes.

Another important factor is cooperation with firms and companies. Each example of possible application of learned knowledge after graduation and potential reward is very motivating, even more so as we draw closer to meeting the expectations of the student. Therefore, it is important to be interested in the expectations of the students and how to eventually satisfy them.

Teacher

"If a teacher educates just to secure livelihoods, his students are bored, are tired and are withering with him" - Konstantin Sergeyevich Stanislavsky.

The quality of education does not depend on the subject which is taught. It depends only on the teacher. Without hesitation it can be said that if the teacher is not able to motivate students to study, s/he is not doing his/her job well.

Teacher qualifications

'Teacher quality matters. In fact, it is the most important school-related factor influencing student achievement' (Rice, 2003), and Darling-Hammond (2000) also have the same opinion, stating that: 'characteristics such as certification status and degree in the field to be taught are very significantly and positively correlated with student outcomes'. Therefore it is necessary for teachers to constantly educate themselves and also to be evaluated (Çeliköz, 2009). If the evaluation is not correct, corrective action must be taken immediately. No student can be motivated enough by outdated information which does not correspond to the present time.

Teaching style

The most common connection between student and teacher is during lectures, seminars and through the teaching materials. Although a teacher may be skilled, and no matter how familiar they are with the subject to the last detail, if they are not able to present their knowledge, they are useless. Over the years, each teacher develops their own characteristic style of teaching and many of them are described in scientific articles (Keefe, 1986; Schmeck, 1988). Modern educational tools can be used to create better teaching materials, inspiring lectures and attractive exercises. Currently the most commonly used are E-Learning and Project-Based Learning. The advantages and disadvantages of e-learning are described in many specialized articles (Kanninen, 2008; Bennett *et al.*, 2012). This tool is very flexible. The education model can be adapted easily for humanities and technical fields (Khasawneh, 2010; Hynek, Grach and Votapek, 2014). Project-Based Learning is the opposite of E-learning, it is more focused on solving a particular problem on a real subject. The main advantage is that it eliminates some of the disadvantages of E-learning, especially in technical fields. Unfortunately, the application of this approach requires the cost of premises, facilities, time and devoted teachers. For example, Lam et al. (2009) stated that:

Project-based learning will have a better chance to bring about the desired benefits, such as improved motivation for students, if teachers themselves have a strong motivation to experiment with and improve it in the classroom.

By correctly combining these two styles, obsolete teaching methods and bad practice from earlier times can be removed. Most importantly, the teachers are motivated to look for new styles and make changes.

Relationship

Even the smallest details affect students' motivation and make big differences between teachers. It is not enough merely to amaze students with knowledge. The outer appearance and confident behaviour of a teacher in class and other characteristics are important factors (Wayne and Youngs, 2003). Even though the teacher is superior to students in the class, it is important to build a personal relationship on a professional level, identify the characteristics of the students, be interested in their interests and use all this information during communication. For building a relationship with students it is appropriate to use practical experiences, personal stories or current events. When posing a question do not ask just one student, but invite more students into the discussion. Do not use sarcasm, criticism, or abusive remarks, and any negative issues and problems should always be dealt with in private, so that they do not feel embarrassed in front of their classmates. Behaviour and body language are also important (Neill and Caswell, 1993). The teacher must look confident, establish eye contact, smile and recognize the current mood of a student from his/her behaviour.

Conclusion

It is certain that if a teacher is motivated enough, this can create the foundation for an educational model that attracts students to lectures and seminars. At the same time, it increases the incentive to pass the subject, to increase the commitment of students to educate themselves in their own free time and set themselves high goals. Therefore, it is necessary to motivate and be motivated. Take advantage of the willingness of parents, teachers, colleagues, classmates and others to help in developing our personality and achieving the stated objectives. Even in the case of failure it is necessary to find new motivation and always continue forward.

Practical Implications of the Weak Signals Concept for Control System of Production Projects Execution

Piotr Wittbrodt, Opole University of Technology, Department of Management and Production Engineering, Opole, Poland, p.wittbrodt@po.opole.pl

Abstract

A weak signal is the carrier of a message to specific parameters of an object, system, process or production project. Activation of this sort of data and its further transformation into useful information (knowledge) allows to anticipate future environment variables and record early symptoms of potential changes in the plan of a project. The concept of weak signals is the starting point for constructing an early warning system as a tool for monitoring possible threats in a control system of production projects execution. An important element of early warning of imbalances/disruptions is a module monitoring production processes. Wear and tear diagnostics of a control system of production project execution requires a systemic approach. The purpose of this article is to present solutions dedicated for constant monitoring of machinery and equipment in a production system, as well as the flow of materials and information in processes. Therefore, a synthetic approach was proposed, based on the use of measuring systems risk analysis, and the earned value method which allows to control the project completion stages (work progress). Early identification of weak signals, their proper assessment and estimation of a forecast of future conditions require taking appropriate real-time actions. Proactive steps translate into effectiveness of production projects execution.

Keywords: weak signals, early warning system, production project, measurement systems, project execution control, risk identification, earned value method (EVM).

Introduction and background

The global economic crisis which started at the beginning of the 21st century reached an unexpectedly large scale and significantly slowed down the world's economy. Together with a relatively high level of synchronicity of business cycles of many of the Western countries and of the emerging markets, the scale of this phenomenon caused a significant decrease of the economic growth. Commonly observed results of an economic crisis, apart from a general economic downturn, also include a decrease of quality, which has a permanent impact on the functioning of an economic system. Nowadays there is a noticeable tendency among production companies to be focused on the external environment of business, which consists of defining company targets in terms of market and customers needs. Global economic political and social processes have necessitated internal reorganisation of most companies and contributed to a flexible reaction to the changing needs of customers. The majority of those changes bring the necessity of implementing new solutions in the area of company management, which, in turn, increases the difficulty of finding suitable approaches towards production management.

The challenges which must be faced today by most production companies are the result of the strategy of diversification, which leads to an increase of the offered goods and the sizes of orders. Nowadays, due to specific requirements of customers, most of the production is realised in MTO (make-to-order) mode, with only a part of the offered goods and manufactured in the MTS (make-to-stock) mode, most of which include standard goods of high demand. In case of mass production and varied production, which is characterised by irregular orders for not only standard but also custom goods, the flow of materials through the production process is organised in non-pipeline forms. Flexible sets of operations logically conditioned in time and space, with a changeable structure

adapted to the quantity-quality characteristics of the manufactured goods, comply with discrete processes in which non-constant flows of energy and materials dominate (Muhlemann, Oakland, Lockyer, 1992). Discrete production is the dominant type of production in Poland. It is dedicated for, among others, cabinet making, car and electronic industries, and it requires preparation of complicated engineering documentation and software controlling the production devices, as well as complex production planning. The greatest problem in managing a mass production with often very limited resources is a high changeability of external and internal conditions.

In the classification of industrial production processes by continuity and duration we find, apart from discrete and repetitive manufacturing, project production which refers to aviation industry defence industry and companies which design product to order and those which use the Seiban production control method (a method which enables a comprehensive management of the structure of commissions and orders. It enables a comprehensive planning and monitoring of production of custom goods in terms of deadline, costs and availability of materials and components). The variability of factors which have effect on individual resources of the production system and the environment dynamics cause numerous deviations from the plan, which calls for proper management of production in order to meet the expected results). In production to order, a production commission is generated after an order from a customer was received, which hinders production control understood as a system of actions which aim at receiving the desired results by the production system and the company (Pająk, 2006).

The development of CE (i.e. concurrent engineering) had a great contribution to the introduction of solutions based on project management paradigms to the practices of companies functioning. Concurrent engineering strategies, evolving towards Concurrent Engineering Environment which takes into account the cross-over of business and engineering activities, are widely applied in the processes of products development. According to the engineering approach, an integrated, concurrent engineering of a product, manufacturing process and auxiliary processes have been the methods more and more often used to reach operational and strategic goals as well as to introduce general improvements in the activity of a company. Parallel and serial-to-parallel performances of development tasks (e.g. in the new product development process) show the essence of this approach and set them apart from the traditional sequential (serial) approach. Thanks to this, already at the initial stages of product engineering the decisions are made concerning the product's quality, costs, meeting customers expectations in all the stages of the product's life cycle. Such projects are realised on the basis of initially incomplete data, starting with the preparation of an offer and a quote, then the preparation of a budget and realisation schedule and finally there is the control and realization of the project and the preparation of accounts for the contracted work. The repetition of orders is close to zero. The order realization process in this sort of environment requires special support in terms of knowledge management. This approach requires team work of specialists from different organizational departments in a company. During each stage, project team members are active participants in the processes of solving problems and making decisions.

In an integrated development of products, processes and production systems, a number of methods are used to facilitate the activities which form information aimed at defining the product, the process and the manufacturing system. One of the more important effects of implementing production systems which allow realisation of modern development strategies is a shorter start up time of new products and faster realisation of orders. The range of the effects depends on the efficiency of the information-decision connections between the stage of the technical preparation of the production and the sphere of the planning of production management systems. An integrated process of production process realisation reflects a network of stages, tasks, activities and the correlations among them. Such correlations between individual stages are the result of the relationships between tasks and the required knowledge at individual stages of project execution.

Problems with managing a mass production in conditions of limited resources

The challenges that must be faced by most manufacturers today who produce to order are focused on many important issues whose sources are, by and large, the result of mass production in conditions of

limited resources. The selection of goods is wide and not stable. It is difficult to foresee the size of potential orders and their timing. High changeability of this type of production results in machinery being placed in groups, e.g. according to type, which creates specialised technological cells, and every realised product requires the use only some of the resources (Knosala et al. 2007). It is also worth stressing that in case of such an organization of production the number of employed blue-collar workers does not match the number of operators necessary for proper functioning of all the machines at the same time. It is economically justified, as the machines are not loaded evenly and it sometimes also happens that some of the machines are used very rarely. However, this has serious implications for production control (Wróblewski, 1993). When planning production, one should remember not only to secure the material demand on an appropriate level but also about proper, economically justified load of the machinery. In the conditions of limited resources, this can mean deciding to use a machine at the right moment at the price of stopping the use of another production resource.

Purchase of resources for production is often forecast, which is usually imprecise; the longer time period the forecast concerns the higher the degree of imprecision. Varied and unstable assortment of goods makes it difficult to foresee the size of potential orders and their timing. Moreover, the average time between the dates of order placement and its realisation is shortened (Knosala et al. 2007). Different realization times of production orders, insufficient production resources and problems with overdue delivery of raw materials cause substantial problems in production planning, and production plans which need constant changes entail the need for flexible, adaptable control. When analysing the situation of production companies, it is worth noticing that there are certain difficulties which occur in almost every company which manufactures a wide range of products in conditions of variable number of irregularly received orders. They include (Trojanowska, Koliński, 2011):

- high costs connected with maintaining materials stocks and intermediate warehouses,
- a long time of material flow through the production system has a negative effect on the quality of the finished product,
- overdue realisation of customers' orders,
- no online information about the current state of the realisation of individual orders,
- plans becoming outdated fast.

High changeability of the conditions and the dynamics of the production environment are a serious problem which hinders production planning, and thus also its control. The foundation of control is the assumption that in case of system ill-adjustment resulting from external and internal factors, there is a deviation from the plan and, in order to achieve the initially planned results, a number of actions is undertaken. It should be noted that the direction of the actions taken must be in accordance with the adopted production strategy. The fundamental tasks of production control are (Śliwczyński, 2008):

- control and current checking of the availability of workforce, machinery and devices, tools, materials necessary to realise the adopted production plans,
- determination of current priorities in the realisation of production tasks,
- tracking and reporting the course or the production process activities and the flow of materials and production deficiencies, stocks, the condition of machines and the use of the workforce,
- securing the flow of information and production documentation necessary to assess and regulate the works in progress, the use of supplies and the flow or materials.

The level of difficulty in the realisation of these tasks depends on the type and form of production organization employed in a given company. Among the factors that affect the realisation of the control function are the following: (1) organisation and flow of production, (2) information and information flow, (3) short-term planning systems, (4) technological process requirements, (5) stable prioritising and (6) system feedback. The major problem of control is the speed and relevance of responses to the occurring disruptions. It is assumed that taking proactive rather than reactive actions greatly improves the efficiency of production processes. Reactive management leads to elimination or maintenance of deviation (which results from past actions) and the undertaken actions usually are a late reaction to the occurred situation. While in a proactive system, potential causes and results are analysed. Still the contemporary production systems are reluctant to design the future. Foreseeing of potential problems, with the view to avoid them, or searching for new solutions to implement them,

aims at proper identification of opportunities and threats. In the new reality, companies more often are facing the issues of adaptation and dynamic and intelligent production control.

The idea of early identification of changes

The purpose of the carried out research and the proposed concepts is the pursuit of early identification of changes during the execution of production projects in order to properly direct the actions and preparation to manage changes in a proactive manner. The context of the analyses was focused on an attempt to gain information on the subject of potential problems and the obtained order control indexes in mass production via early detection typical of the theory of weak signals by H. I. Ansoff (1975). In every organisation, early detection of upcoming changes plays a crucial part. The incoming signals (often a first sign of changes, of little meaning at the moment of their appearance but which can have a decisive effect in the future) carry with them the knowledge about the environment and can become the basis for the decisions about identification of changes taken in the organisation. The information from the signals of the early detection system plays the role of an initiator of readjustment processes. Such processes are indispensible for the organisation to react to changes in advance. In the literature of the subject, early symptoms of changes are referred to as *weak signals* (compare Fig. 1).

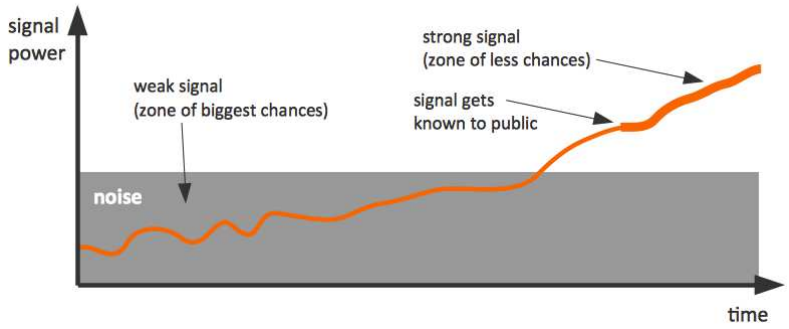

Fig. 1. Conception of a weak signal
Source: (Eckhoff, Markus, Lassnig, Schön, 2014)

The concept of weak signals is the starting point for constructing an early warning system as a tool for monitoring possible threats in a control system of production projects execution (compare Fig. 2). The proposed early warning system consists of three modules: monitoring, diagnostic and predictive. The monitoring module is responsible for observing and collecting data. The diagnostic module is responsible for assessments based on the observed symptoms or comparisons with the standard. The predictive module provides a forecast of future conditions on the basis of the data and observations collected in the monitoring module and the correct assessments in the diagnostic module.

The diagram of a structural early warning system presented in Fig. 2 shows, apart from such input data as: weak signals, thought models, power, norms, resource and output data (including forecasts, future scenarios, assumptions, language, cause and effect relations), also show process connections and their inclusion in the production system. Such conditions require an integrated implementation of the early warning system into the structure of the production project control system. This is substantiated by the process approach understood as action during which resources (i.e. machinery, devices, raw materials, knowledge, data base, workforce, financial resources) are used and which is managed towards proper input-process-output transformation. Thus, the input consists of: customer's requirements (contracts, orders), materials, raw materials, prefabricated products, technical documentation, information, legislation, etc. And the output of the production process we have: the product, service, decision (or a combination of these) and customer's satisfaction.

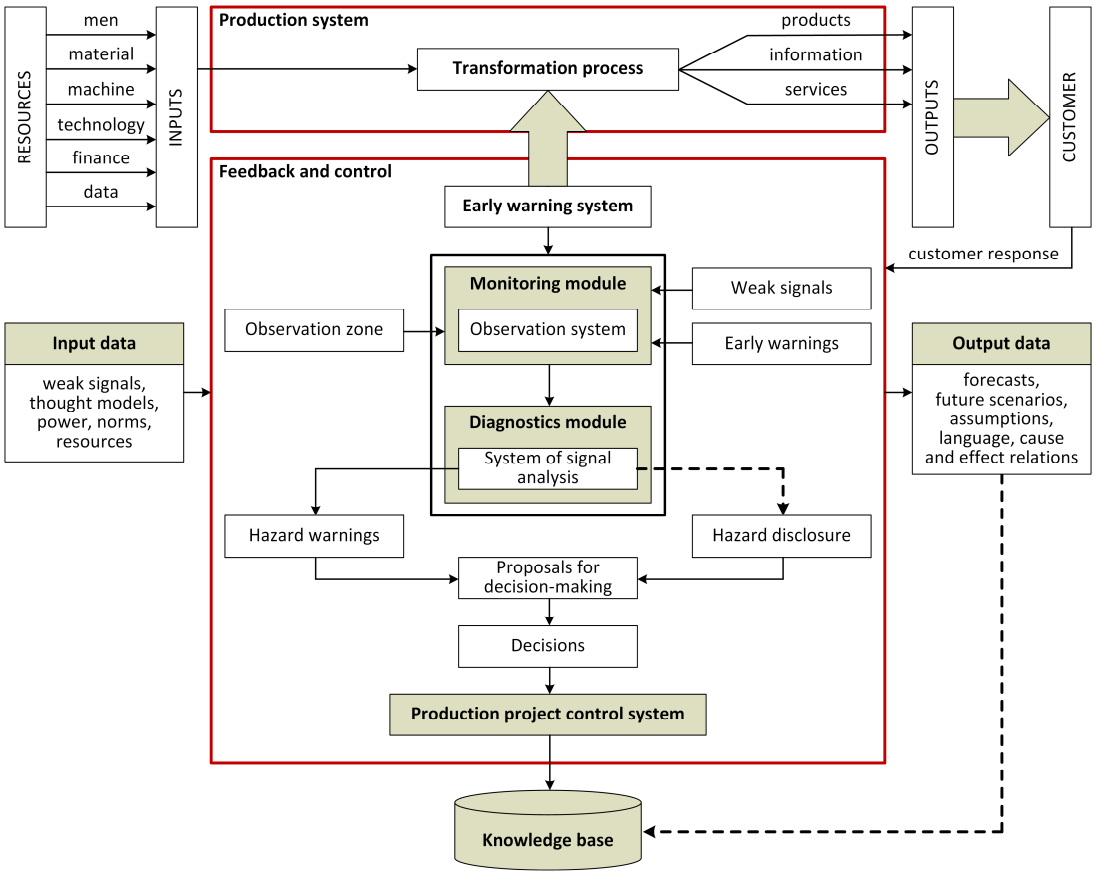

Fig. 2. Implementation of the early warning system into the structure of the production system

Among the innovative technologies used in industrial processes control are:

- techniques of monitoring of the size of typical industrial processes,
- techniques of diagnosing industrial processes,
- wired and wireless network technologies with data transfer synchronisation.
- systems of visualisation of the conduct of industrial processes,
- technologies of automatic identification during production and measurement (such as RFID and similar) in time,
- technologies of so-called real time, e.g. XFC (eXtreme Fast Control),
- systems based on AI algorithms,
- technologies which use non-linear systems of control and analysis,
- technologies which use intelligent control systems.

These technologies have immense impact on early detection of weak signals in the control of production projects execution and are an essential reference point for building an early warning system. The subject in question is also related to a selected group of technologies which relate to automatics, robotics and measuring techniques, as well as the technologies used in transportation and logistics.

An important element in recognising potential threats in a system of project execution control is the module which monitors the production process. It is the core of the early warning system. Wear and tear diagnostics of a control system of production projects execution requires a systemic approach. A final outline of the concept consists of monitoring both machinery and devices in the production system, as well as the material-information flows in the process. The concept of weak signals as the foundation of the structure of the monitoring module is a synthetic formula for the proposed

solutions. Practical implications of the concept of weak signals for the early warning system stem from the consolidation of both technical (static) and organisational (dynamic) elements. Technical (hard) elements of the monitoring module are measurement systems (dedicated for diagnostics of machinery, devices and tools) whose role is to detect weak signals as symptoms of potential disruptions in the production projects execution control. On the other hand, organisational (soft) solutions are based on risk assessment and the earned value method which enables the integration of range management, schedule management and project costs management, at the same time controlling project execution progress.

Detecting weak signals with technologies in process production

Recognition of weak signals in production processes often requires the use of modern technologies and is the result of implementation of appropriate measurement systems. Such innovative technologies which use dispersed measurement systems include:

- distributed processing technologies,
- group communication technologies,
- clock synchronization technologies,
- distributed transactions technologies,
- multiplication technologies,
- distributed processing technologies,
- technologies of failures detection, their tolerating and masking,
- technologies of state reproduction.

Measurement systems are used by almost all production companies. The term *measurement system* has a broad meaning. It is connected with measurements in general, telemetry or monitoring systems. Over a number of years when measurement systems have been present on the market, there have been many solutions, both scientific and industrial. A lot stress is put on quality in production or services; this is why the importance of industrial measurement systems in growing every year. It has been observed that properly functioning measurement systems greatly influence the quality of production processes.

A measurement system is a complex system consisting of one or many measurement tracks. Every measurement track has a driver, microcontroller or a computer which is the control unit (a graphic interface or data acquisition device). In real measurement tracks, it is a rare situation when individual functions are realised by separate measurement devices. Fast development of IT technologies has led to a situation where most currently realised measurement systems can be called computer measurement systems. Such a computer measurement system can have various configurations. According to the type of connection of the elements with the main unit, the configurations are as follows:

- linear (bus) – the exchange of information takes place through the system bus,
- in series (tandem) – the exchange of information take place only between the neighbouring elements,
- star – the control unit communicates with every device independently.

At the moment, all high-quality measurement devices are computerised and have Ethernet network port or at least a USB port and built-in software which enables controlling the device via WAN network. Many executive elements have communication interface which helps avoid problems with configuration and drivers, which may be problematic for a potential user in many situations. The popularity of such solutions also results from a very good customer support by the producers of specialised software, e.g. LabView by National Instruments.

One of the latest solutions widely used in the communication between the elements of a measurement system is the use of cordless communication technology, e.g. Bluetooth, WiFi and GSM. A large part of the measurement infrastructure has the structure of an installation dispersed in a production hall or in a number of production buildings. That is why cordless communication, which ensures the

possibility of easy integration of all sorts of measurement elements, becomes very valuable. Another solution which is becoming more and more popular is the cloud technology used for storing and managing data. This type of data acquisition so-called Big Data application is used in large measurement systems which have multiple measurement points.

The structure of a typical measurement system consists of a controller which controls the activity of the system and a set of functional units. These units include: measurement sensors transforming measurement values, signal acquisition block data processing block and user communication block. The functional units are most often realised through hardware, which entails higher costs of building a measurement base. In order to lower the costs, a concept of virtual measurement instruments was devised. A virtual instrument (most often in the form of software) may be built by the manufacturer as well as by the user. It is their great advantage, as this makes the instrument flexible and reconfigurable. This enables to create a collection of virtual instruments which realise various functions and which reduce the costs of instruments and shorten the time of their preparation and further modifications.

In many companies, measurement systems are regarded as an optimization tool by means of which something can be made more efficient, or production costs may be reduced. Nonetheless, in the proposed early warning system they will mostly have monitoring function which, combined with the organising aspects of the concept (risk analysis, earned value monitoring) offers a holistic approach towards an early detection of distortions in the production projects execution control system.

Early warning as a part of project risk management

The first of the analysed areas aiding in an early warning of potential disruptions in processes and in the production organisation is project risk management. Risk management concentrates on the identification and control of events which may have detrimental effect on project execution, and its main goal is to minimise project failure risks. The process of risk management in projects consists of particular stages. PMI distinguishes individual stages in risk management (PMI, 2013). In practice, this means that risk management is a process of identification, analysis, assessment of various types of risks and monitoring and control of threats which may affect a project positively or negatively. The process of risk management should be an integral part of project management.

Project risk management involves decision-making and carrying out actions that lead to the achievement of an acceptable risk level by the project team. The knowledge of risk involved in the execution of a given project is one of the factors in project success (Lock, 2007). The ability to predict threats and accordingly preparing an effective contingency plan are key in project management. Risk management is focused on identifying and controlling events that can have a negative impact on the execution of a project, its main goal is to minimize the risk of project failure (WSDOT, 2014). Project risk management consists of several stages, as determined by the Project Management Institute (PMI, 2013). In practice, risk management is a process of identifying, analyzing and assessing different types of risks, as well as of monitoring and controlling events that can affect a given project in a positive or negative manner. Risk management should be an integral part of project management (Jaafari, 2001). The main goal of risk management is to identify and assess the risk of a given project. The first step of risk management is risk identification. In this phase all potential risk sources are identified. Potential risk factors, which can have a particular impact on the project, are determined. A number of techniques of project risk identification are used in practice. Potential project risks can be determined through: brainstorming, checklists, questionnaires and interviews, the Delphi group method, cause-effect diagrams (Mojtahedi et al., 2010). Risk assessment constitutes the second stage of risk management. The main goal of project risk assessment is to measure the impact of risks identified for a particular project. To this effect, the following methods are employed: Event Tree Analysis (ETA), Faults Tree Analysis (FTA), the Monte Carlo method, Scenario Planning, Sensitivity Analysis, Expected Net Present Value (ENPV), Decision Trees, Program Evaluation and Review Technique (PERT), Estimations of System Reliability, Failure Mode and Effect Analysis (FMEA), and Fuzzy Set Theory (Elbrahimnejad et al., 2010).

In (Nikander, 2002) a procedure was proposed for early warning which was based on earlier assumptions by Ansoff (1984). Individual stages of the procedure, such as: making an observation, accepting the observation as an early warning, determining the state of knowledge and the time available, identifying the problem and its cause, are regarded as the first phase of project risk management, and called risk identification. The proposed approach to risk analysis dedicated for projects was more widely presented in (Łapuńka, Pisz, 2015).

The need of knowledge acquisition (weak signals, in particular), its structure and proper processing during the entire process of project management are a crucial element of the carried out tests. Adaptation of the concept of weak signals to project market management and its implementation in a system of early detection of chances and threats in the execution of production projects facilitates data control. Such inference, also called progressive, leads from facts, thought rules to the final conclusions. Apart from risk factors predefined at the stage of project initiation, these are early signals registered during the control of project execution that will enable the possibility of proactive response to disruptions which appear during the phase of production project execution. Undertaking proper actions and preparation in advance for an unwanted situation may contribute to increasing the effectiveness of the realised projects.

This aspect of the discussion leads to regarding early warnings in categories of risk identification in the structure of project execution control. The second of the organisational aspects of this discussion leads towards monitoring and control of the production projects processes with the use of the EVM method.

Early warning as a part of monitoring and controlling process

Early warning systems provide IT security for planning and control processes by supplying information reducing the uncertainty of decisive situations, and so they make taking more rational decisions impossible. The EVM method enables the integration of the management of range, schedule and project costs. It is a tool for project state analysis, and it also allows to forecast execution of projects in the future. EVM is the most effective tool of project execution measurement, and thus also of its control. Using the earned value method allows project managers to close a project management cycle in accordance with Deming's PDCA (Plan-Do-Check-Act). The condition for using the earned value method is preparation of an appropriate plan and its realisation prior to the project initiation, as well as management of the project and detailed valuation of work resources. Every project which has its own WBS work plan, defined costs structure and appropriate system of data collection can use the earned value method.

The EVM requires detailed planning and the use of systems of costs monitoring and calculation. Apart from that, an appropriate control system and responsibility for reached targets are necessary. Implementation of the EVM in an organisation may require a change of work practices to a greater degree than just in terms of reports preparation. Higher level of discipline in the planning process will require focusing on objective reporting, integration between planning systems and accounting systems. The process of planning begins with determining of the range through the product breakdown structure (PRINCE2) or work breakdown structure (PMBOK). These structures allow for hierarchical decomposition of the range, but they do not present the logical relations between individual elements. That is why the next step is developing of a network of reliability directly with WBS or indirectly through the product breakdown structure (PRINCE2). During the project planning process, the earned value method requires a PMB (performance measurement baseline). This requirement strengthens the importance of project planning principles, especially those connected with range, schedule and costs. Deviations during the execution of a production project are recorded with respect to this performance measurement baseline.

The project's final product should be broken down into tasks necessary for its production. In this way a WBS (work breakdown structure) is formed, which is an element of project range management plan. An important element here is the OBS (organisation breakdown structure) of a company whose implementation resources realise the project. According to WBS, all the woks in a project should be

thoroughly planned (project schedule). Every task in the work division structure should have allotted appropriate resources (labour and materials). All this will enable proper preparation of costs management plan. Such prepared WBS plans, schedule management plans as an integral element of time management plan, as well as costs management plans, should be recorded (usually using IT tools assisting project management). Such recorded plans, referred to in PMI methodology as base plans, shall be the PMB for the earned value method. Figure 3 presents a PMB for a sample project in EVM.

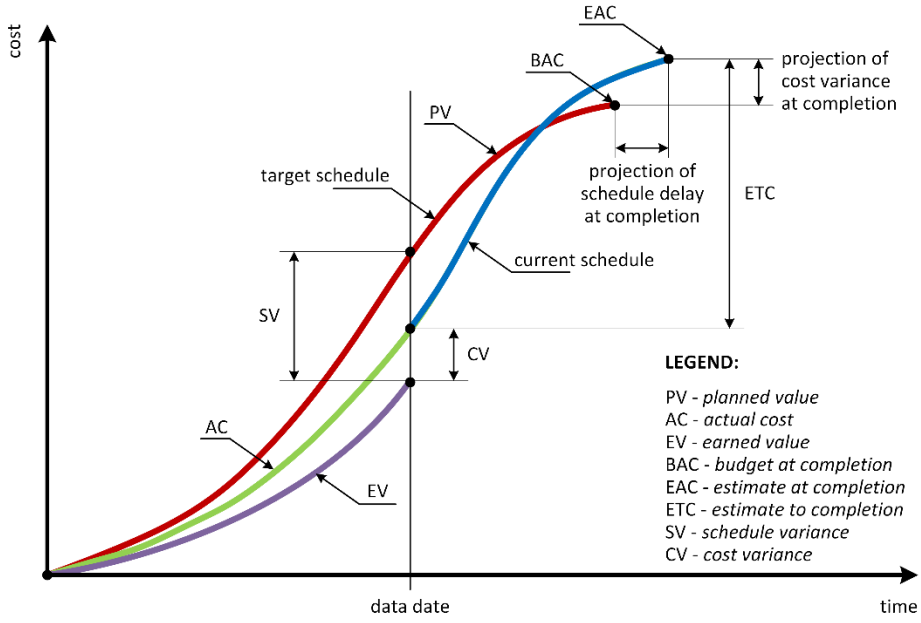

Fig. 3. Elements of EVM

Source: elaboration based on (PMI, 2005)

The basis for measurements of project progress in the earned value method are the following (Kemps, 2000):

1) budgeted cost of work schedule – also referred to as PV (planned value), it is the sum of all the costs planned within the project or its part, calculated from the date of reporting,
2) budgeted cost of work performed – also referred to as EV (earned value); it is the cost of the entire progress achieved in a project or its part calculated from the date of reporting and expressed in the categories of planned costs assumed in the preliminary estimations.
3) actual cost of work performed – also referred to as AC (actual cost), these are the total costs connected with a project or its part calculated from the date of reporting (the sum of expenditure regardless of what was planned or completed).

Precise calculation of the earned vale using the EVM is one of the contentious issues of project control process. EV reporting should be objective and easy to verify. There are several methods of EV estimation (Kemps, 2000), including the following: subjective assessment, measurements-based assessment, practice-based assessment or indirect assessment. When the earned value is plotted on a graph, the difference between that value and the remaining two values can be divided into the part relevant to the deviation of costs of performed work and the part relevant to the work performed within time other than planned (Kemps, 2000; Fleming, Koppelman, 2000):

- cost variance (CV) – the deviation of costs is the difference between the earned value and the real costs at the time of reporting,
- schedule variance (SV) – the deviation of the schedule is the difference between the earned value and the planned costs at the time of reporting.

If the deviation of costs or schedule is a negative value, the project is in a bad condition. On the other hand, if the values of the deviations are positive, the execution of the project is progressing better

than planned. The deviations of costs and schedule can be calculated for cumulative data or individual periods (usually weeks in production projects) of project execution. They should be calculated on the lowest level of detail and summed up increasingly through subsequent stages of the project. Thanks to this, project managers can see where problems with costs and schedule realisation occur and they can undertake appropriate corrective measures. Costs and schedule deviations may change during execution of the project, but mostly they stabilise as the project is about to be completed.

There is a possibility of calculating two indicators which are a measure of the realisation of both costs plans and schedule plans (Kemps, 2000; Fleming, Koppelman, 2000):

- cost performance index (CPI) – it is the quotient of the produced value to the total sum of expenses in a project at a given point in time.
- schedule performance index – it is the quotient of the produced value to the sum of values which, according to the plan, were to be produced at a given point in time in the project.

CPI and SPI values greater than one mean that the execution of the project in terms of costs and schedule is better than planned. If the CPI and SPI values are smaller than one, it means that the performance is worse than planned. Other measurements of plan realisation within the earned value method are presented in table 1.

Table 1: Measurements of project execution within the earned value method (EVM)

Data	BAC		AC		EV		PV
Deviations		VAC		CV		SV	
Indicators		TCPI		CPI		SPI	
Forecasts	EAC		ETC		ATE		
Formulas	VAC=BAC-EAC			CV=EV-AC		SV=EV-PV	
	TCPI (BAC)=(BAC-EV)/(BAC-AC) TCPI (OD)=(BAC-EV)/(BAC-PV)			CPI=EV/AC		SPI=EV/PV	
	EAC=BAC/CPI						
Legend:							
BAC – budget at completion VAC – variance at completion EAC – estimate at completion TCPI – to-complete performance index OD – original duration of the project ETC – estimate to complete ATE – actual time expended to date				AC – actual cost EV – earned value PV – planned value CV – cost variance SV – schedule variance CPI – cost performance index SPI – schedule performance index			

Source: elaboration based on (Łabuda, 2012)

In order to assess the total costs and the date of project completion, assuming that the trends determined at the date of reporting remain unchanged until project completion, we may use the EAC, ETC relation described in greater detain in the literature on the subject of earned value method (Kemps, 2000; Fleming, Koppelman, 2000). Table 2 presents an interpretation of the basic indicators of work performance in the earned value method.

Table 2: Interpretation of the basic indicators of performance in EVM

Performance measurements		Schedule		
		SV>0 and SPI>1	SV=0 and SPI=1	SV<0 and SPI<1
Costs	CV>0 and CPI>1	Ahead of the planned schedule, below the planned budget	In accordance with the planned schedule, below the planned budget	Behind the planned schedule, below the planned budget
	CV=0 and CPI=1	Ahead of the planned schedule, in accordance with the planned budget	In accordance with the planned schedule and the planned budget	Behind the planned schedule, in accordance with the planned budget
	CV<0 and CPI<1	Ahead of the planned schedule, over the planned budget	In accordance with the planned schedule, over the planned budget	Behind the planned schedule, over the planned budget

Source: elaboration based on (Fleming, Koppelman, 2000)

The earned value method has many advantages; it facilitates project management, costs planning and control and project performance. The key good practices of the earned value method include (Lambert, Lambert, 2000; Łabuda, 2012):

1) Establishing the performance measurement baseline for works performance at the planning stage by:
- decomposition of the project range to the determined level of WBS,
- a clear responsibility assignment matrix,
- ascribing an appropriate budget to every task in the project schedule,
- selecting the earned value measurement determined for all tasks in the project schedule,
- maintaining the integrity of the PMB in the project, where integration refers to the range, schedule and the costs of the project.

2) Measurement and analysis of works performance in relation to the determined PMB during controlling:
- recording the use of resources during project execution,
- objective measurement of the works actually performed in the project,
- measurement of the earned value in accordance with the measurement technique adopted for the project,
- analysis and forecasting of costs/schedule performance,
- reporting problems in project execution and/or undertaking corrective measures.

Conclusions

The process of project management requires the use of various forms of information about the environment in the project's life cycle, generation of new knowledge (project knowledge), an increase of the level of organisational learning and taking process-related decisions. In practice, this implies the need to possess such a type of information which is the result of weak signals detection and enabling the anticipation of future conditions of the environment. This is why it is necessary to create early warning systems which are a special type of information systems dedicated for decision-makers, including production projects managers. The information from the early detection system signals plays the role of an initiator of readjustment processes. Such processes are indispensible for the organisation to react to changes in advance.

Undoubtedly, an important element of the carried out tests is to identify the barriers blocking early recognition of changes in a project execution control system at the individual, group and organisational levels. These issues were generally discussed in (Bąk, 2013). Dedicated solutions such as models, programmes, tools will be the aim of our further analyses and verifications of their importance for the dynamic structures of production projects execution control. The awareness of such barriers as knowledge on the subject of possible solutions will allow us to efficiently recognise the symptoms of early changes (potential disruptions), and eliminate the unnecessary background noise and false alarms in the early warning system. As a result, it will enable obtaining of information in advance and will support the process of taking actions in real time whose ideological purpose is the increase of effectiveness in the execution of production projects through proper control.

Abstract

This paper highlights the importance of knowledge, as the basic asset in today's knowledge economies and also as the main support for any sustainable performances of the SMEs. A lot of research has placed accent on what happens in large multinationals, so this study comes to balance the findings and show if there is a link between the basic knowledge processes in a small company and sustainable performance. The study also includes a comprehensive literature review on knowledge management and performace measurement related to knowledge management in SMEs. We found that the processes of knowledge acquisition, knowledge sharing and knowledge implementation or use are directly correlated to the a companies' performance. For sustainable development, knowledge managers must pay attention to the basic processes related to knowledge in their organizations. The study is very usefull for practitioners, because it shows a direct link among operational processes in the organization an performance and also it bring value to researchers because of the literature review and analysis.

Keywords: knowledge management, knowledge organization, SMEs performance, small and medium-sized enterprises;

Introduction

Firm performance was intensively studied in the last decades, but particular results were obtained only in large companies. Moreover, performance is also a complex and multidimensional business phenomenon. Performance can be characterized as “the firm’s ability to create acceptable outcomes and actions” (Ceptureanu, 2014). For many organizations achieving improved performance is not only dependent on the successful deployment of tangible assets and natural resources, but also on the effective management of knowledge (Ceptureanu, 2015a). SMEs have their own roles to play in the economy, as do large organizations. Therefore, not only do large organizations need to improve themselves through knowledge management (KM) in their pursuit for excellence, but so the same should be the case for SMEs.

The concept of knowledge-based economy is widely used in a variety of contexts and with several meanings (Nonaka et al, 1995). Nowadays, the knowledge-based economy is addressed more broadly and is seen as broader than simply overall high-tech industries. Some authors emphasize the key role of "social class creative" in generating competitive advantage (Florida, 2002). The concept of KM has witnessed considerable research during the last decades (Carrillo et al., 2003; Tsai and Shih, 2004; Lin and Tseg, 2005; Young, 2006). Nonaka and Takeuchi (1995), in their theory on knowledge-based organizations, further emphasized the importance of knowledge in the new economy. Their thesis states that knowledge represents one of the sources of sustainable competitive advantages and that knowledge is the basic foundation for economic performance. Knowledge is an important asset for small and medium-size firms in this times of global competition. Knowledge can be considered an important determinant of success for the small and medium-size firms and undoubtedly one of the few sources of sustainable competitive advantage. For these organizations, KM is an innovative management tool that enables them to benefit from the current interest in the subject in academics and business practice. Gloet and Terziovski (2004) describe KM as the formalization of and access to experience, knowledge, and expertise that create new capabilities, enable superior performance, encourage innovation, and enhance stakeholder’s value.

Literature Review

Knowledge is important to any modern organization in the XXI century. Knowledge had witnessed considerable research in the past few years (Bruton et al., 2007). It is widely recognized that knowledge is

an essential strategic resource for a firm to retain sustainable competitive advantage (Ceptureanu, 2015b). As knowledge is created and disseminated throughout the company, it has the potential to contribute to the company's value chain by enhancing its capability to respond to new and unusual situations. Knowledge is "an asset that needs to be effectively managed" (Davenport et al., 1998). Interest in knowledge management has grown dramatically in the recent years, as more researchers and practitioners have become aware of the "knowledge potential to drive innovation and improve performance" (Cavaleri, 2004). Knowledge management is an emerging concept in the field of management and widely adopted in organizations for enhancing performance. It is promoted as an essential cornerstone for companies to develop sustainable competitive advantage and to remain at the forefront of excellence in a level playing field market (Ceptureanu et al., 2015a). Liebowitz and Wilcox (1997) stated that KM can be defined as the explicit control and management of knowledge within an organization aimed at achieving the company's objectives.

Knowledge management is an approach of more actively leveraging "the knowledge and expertise to create value and enhance organizational effectiveness" (Gold et al., 2001; Scarbrough, 2003). It provides a new way for the organization to achieve explicit and tacit knowledge sharing (Ceptureanu et al, 2015b). Knowledge management impacts firm performance through its efficiency in developing the intellectual assets that are a source of competitive advantage (Ndlela & du Toit, 2001). For an organization to remain competitive, it must effectively "practice the activities of creating, acquiring, documenting, transfering, and applying knowledge in solving problems and exploiting opportunities" (Zack, 1999). Further, effective KM entails an "understanding of the interrelationships that may exist among KM processes such as knowledge acquisition, knowledge creation, knowledge documentation, knowledge transfer, and knowledge application" (Lee et al., 2005). Firms that exhibit a greater level of KM capacity experience a learning effect that can reduce redundancy, respond rapidly to change and develop creative ideas and innovation (Gold et al., 2001; Scarbrough, 2003, Ceptureanu, 2015c). The quality of decision making depends on acquisition, sharing, and application of knowledge across individuals and organizational groupings. As described by Bergeron (2003), the KM approach or process consists of eight fundamental components, namely acquisition, modification, use, archiving, transfer, translation, access, and disposal. Scholars have addressed several KM processes or activities, including acquisition or creation, storage, sharing or transfer, and usage or application (Bouthillier and Shearer, 2002; Beckman, 1999; Wiig, 1999). In this research, we look upon three KM processes: acquisition, sharing and application of knowledge.

Knowledge acquisition is one part of KM which, in turn, has been defined as "[...] the process of critically managing knowledge to meet existing needs, to identify and exploit existing and acquired knowledge assets and to develop new opportunities" (Quinstas et al., 1997). Knowledge acquisition is "the process by which knowledge is obtained" (Huber, 1991). Knowledge acquired can be tacit, explicit or a combination of both. Knowledge acquisition results from individual participation and interactions with tasks, technologies, resources, and people within a particular context (Tsoukas, 1996). Several scholars agree that part of managing knowledge within the organization is developing processes that acquire knowledge (Leonard, 1995; Nonaka and Takeuchi, 1995). Two primary means for collecting knowledge are as follows:

(1) to seek and acquire entirely new knowledge;

or

(2) to create new knowledge out of existing knowledge, through collaboration between individuals and between business partners (Leonard, 1995; Nonaka and Takeuchi, 1995). Several researchers also emphasize that collaboration with other organizations is critical to knowledge acquisition (Grant, 1996; Matusik and Hill, 1998).

Firms who can acquire external and internal knowledge would reduce uncertainty and achieve a greater number of administrative and technological distinctiveness (Sarin and McDermott, 2003).

The goal of **knowledge sharing** can either be to create new knowledge by differently combining existing knowledge or to become better at exploiting existing knowledge. It comprises a set of shared understandings related to providing employees access to relevant information and building and using knowledge networks within organizations (Hogel et al., 2003, Ceptureanu et al., 2015d). Knowledge sharing refers to collective beliefs or behavioural routines related to the spread of learning among different

individuals or units within an organization (Moorman and Miner, 1998). It is about how individuals, groups, and organizations communicate and learn from each other. Personal or organizational networks play an important role in accessing knowledge. The sharing of knowledge is facilitated by some kind of personal or virtual network. Without networks there is no opportunity for accessing knowledge. Networks can be maintained by formal or informal face-to-face meetings, or – the latest trend – by physical structures that do not allow individual cubicles, but emphasizes transparent community spaces. Knowledge sharing is critical to a firm's success (Davenport et al., 1998). Knowledge sharing creates opportunities to maximize organization ability to meet those needs and generates solutions and efficiencies that provide a business with a competitive advantage (Reid, 2003).

Another important aspect of the KM process in organizations is **knowledge application**. Wiig (1999) notes that the value of knowledge assets is realized when the assets are being used to create products or deliver services, or when they are sold or traded for value. Knowledge application is a focal element in KM process (Grant, 1996). Knowledge application is defined by some researchers as "the utilization and use of knowledge in an enterprise's value-adding process". It includes adapting, integrating, and applying knowledge to the organization's processes and products. By effectively applying knowledge, individuals might make fewer mistakes or improve their efficiency and reduce redundancy (Gold et al., 2001).

SMEs **performance** is an indicator which measures how well an enterprise achieves its objectives. Ho (2008) defined performance in terms of "how well an organization accomplishes its objectives". Schermerhorn et al. (2002) point out that "performance refers to the quality and quantity of individual or group work achievement". Delaney and Huselid (1996) suggest two ways to assess SME and market performance. Koh et al. (2007) rightly pointed out that although performance is measured by both financial and market criteria, the short-term objectives of supply chain management are to enhance productivity and reduce inventory and lead time. A number of prior studies have measured performance using both financial and market criteria, including return on investment, market share, profit margin on sales, growth of return of investment, growth of sales, growth of market share and overall competitive position (Vickery et al., 1999; Stock et al., 2000). Tippins and Sohi (2003) propose performance measures on four dimensions: relative profitability, return of investment, customer retention and total sales growth. Morales et al. (2011) identifies four dimensions of performance, including:

- Return on assets,
- Return on equity,
- Return on sales and market share
- Growth of sales.

Zack et al. (2009) propose performance measures on five dimensions: innovation, rate of new product development, customer satisfaction, customer retention, and operating costs. Based on the above literature, we focused on three dimensions of performance, including turnover, TQM and stakeholders' satisfaction.

Wolff and Pett (2006) argued that SMEs and entrepreneurial firms are a key segment and driver for most national economies. Successful SMEs have a similar competitive advantage factor that allows them to create a niche in the market by changing their product mix to satisfy customer needs (Gadenne, 1998). SMEs are defined in different ways in different parts of the world. Some define them in terms of assets, while others use employment, shareholder funds or sales as criteria. Some others use a combination of revenue and employment as a hybrid criterion. Current literature suggests that SMEs may be differentiated from larger companies by a number of key characteristics. These are generally described (Ghobadianet al., 1997; Berry, 1998) as: personalized management, with little devolution of authority; severe resource limitations in terms of management and manpower, as well as finance; reliance on a small number of customers, and operating in limited markets; flat, flexible structures; high innovatory potential; reactive, fire-fighting mentality; and informal, dynamic strategies. Lane et al. (2001), suggest that large organizations may suffer from inertia and thus retard learning. This view is also highlighted by some international business and economics studies, which propose that larger organizations may gain less knowledge internally, for example, from foreign parents, than smaller organizations, because they are able to create knowledge by themselves (Minbaeva et al., 2003) or are likely to have more opportunities to acquire knowledge from external sources (Almeida et al., 2003). According to Day et al. (2006), this is because SMEs have a propensity to seek out information more eagerly through interactions with knowledge

possessors than large firms. One important dimension that has an effect on the practice of KM in SMEs is their special characteristics – management structure, markets, systems, culture, etc. – that differentiate them from large organizations. SME characteristics are likely to influence all activities in the life-cycle of knowledge – from the acquisition and capture of knowledge, its organization and storage, and its dissemination/transfer, to its ultimate application. The practice of KM in SMEs differs from that of a large organization because SMEs are not "a little big business" (Wong and Aspinwall, 2004). First, they are a source of innovation in products and services; they supplement a variety of products and services by operating in niche markets (Storey, 1994). Thus, SMEs are an important and indispensable part of a country's growth. Secondly, some of the widely cited potential benefits of KM apply aptly to SMEs. These are improvements in efficiency, decision making, competency, learning, innovation, and responsiveness, among others (Civi, 2000; Frey, 2001; Jarrar, 2002). The vast majority of studies in the literature of KM suggest that KM positively impacts firm performance (Hoopeset al., 1999; Lloyd, 1996; Lubit, 2001, Ceptureanu EG, 2015b). In Jantunen's (2005) research, he states that knowledge is positioned in an organization as a strategic asset which can help the firm maintain its competitive ability in a turbulent environment. Gorelick and Tantawy-Monsou (2005) view KM as a system or framework that integrates people, processes, and technology to achieve sustainable results by increasing performance through learning. The results indicate that KM practices are positively associated with OP as generally suggested by the KM literature, both qualitative (Nonaka, 1994) and quantitative (Choi et al., 2003; Darrochet al., 2002; Schulz et al., 2001; Simonin, 1997; Tanriverdi, 2005, Ceptureanu, 2015a). Given the importance of organizational knowledge, many companies have been trying to influence the acquisition, sharing and application of knowledge (Coombs et al., 1998; DeCaroliset al., 1999; Von Krogh et al., 2001). In fact, knowledge-based assets and KM processes are critical for a firm's performance. Based on the literature review and research objectives, the following hypotheses were derived: KM processes are positively related to SMEs' turnover, TQM and stakeholders' satisfaction.

Research Methodology and Results

The variables in the questionnaire include background information, information on knowledge acquisition, knowledge sharing, knowledge application, turnover, TQM and stakeholders' satisfaction. All independent and dependent variables require five-point Likert style responses ranging from "strongly disagree" to "strongly agree". This study examined a sample of 121 SMEs in Romania. Each company received five questionnaires to answer. The authors request the questionnaires to be completed by entrepreneurs or managers who are familiar with the topic of this study. Out of the 144 SMEs, 121 returned the questionnaires and those were valid and complete for the quantitative analysis (valid return rate is 0.84 percent). The reliability of the measurements in the survey was tested using Cronbach's coefficients. Hair et al. (1998) stated that a value of 0.70 and higher is often "considered the criterion for internally consistent established factors". The Cronbach's coefficients in parentheses indicate the internal consistency reliability of the measures in the six factors are all above the suggested value of 0.70 (Hair et al., 1998). Table I displays the research statistics and Table II presents the results of regression analysis regarding the effects of KM processes on SMEs' performance. Coefficients of knowledge acquisition, sharing and application are positive and significant for turnover ($p < 0.05$, $p<0.01$, and $p<0.01$, respectively). These findings indicate that SMEs would achieve a higher level of turnover if they had well-developed knowledge acquisition, sharing and application. In summary, all three factors of KM processes have the expected signs and also have significant effects on SMEs' performance.

Table 1: Research Statistics

The variables	Mea	SD	1	2	3	4	5	
Knowledge acquisition	5.22	0.82	1	-	-	-	-	-
Knowledge sharing	5.18	0.77	0.22	1	-	-	-	-

F	17.7**	9.7**	14.7**

Note: Significant at: *p<0.05 and * *p<0.01

Discussion and Conclusions

This study examines the role of KM processes on SMEs' performance. The results indicate that KM processes have positive and significant effects on SMEs' performance. So although, KM processes may contribute directly to performance and each resource significant in respect of its construct (Zaim et al., 2007), in some cases the contribution of particular resources may be more indirect through their impact on other factors linked to performance. For example, while the study did not uncover a positive link between performance, and knowledge acquisition and knowledge creation, their study showed both processes were directly related to knowledge application which in turn was related to performance. The practical implication of the results is that entrepreneurs need to actively manage their firm's human capital so as to stimulate managing knowledge acquisition, sharing and application. Furthermore, research suggests appropriate investments in KM initiatives can enhance performance. It is therefore important that firms recognize the variableness of knowledge processes and the need to deploy strategies that lead to the acquisition and deployment of those that are most relevant to the firm's objectives. This study also has some limitations. The first limitation is the number of responses obtained from the survey was rather small. A larger number of responses would probably yield a more accurate finding and so, future research could replicate this study, with the hope that more SMEs have implemented KM. In addition, since this study only investigates Romanian SMEs, hence, the findings and conclusions drawn from this research are representative of the Romanian SMEs, and the findings may not generalize to other geographic regions or cultures.

Abstract

Collaboration systems are a key point in modern Information Systems. They are very useful when companies base their work on “knowledge”. Collaboration systems help knowledge workers to share knowledge and to work together regardless of where they are located. There are several solutions from turnkey solutions, to ad-hoc, as well as customizable solutions. Collaboration systems can be classified as social software and online collaboration tools, and they are useful both for big and small to medium sized companies. The collaboration systems promise to increase knowledge worker efficiency, and this is an important goal for all companies; especially small and medium sized companies. The real problem is that, very often, a knowledge worker does not use the tool. In this paper, starting from an empirical study, the expectations of the knowledge workers and of the companies are defined and a survey of several collaboration based on them will be presented.

Keywords: Collaboration systems, sharing information, survey

Introduction

Companies, especially small and medium sized companies (SME), operate within highly complex situations characterized by very dynamic markets, operating not only locally, but also nationally and internationally. In order to survive, the SME need a flexible type organization, capable of bringing innovation and efficiency. The SME are revolutionizing their traditional modus operandi and initiating the use of new communication tools that let you create real collaboration networks (both inside and outside the company) able to put the company in a position to function within more complex situations. Within this context arises the concept of collaborative e-works, understood as “highly knowledge intensive and involved experts, often with different knowledge backgrounds and from different work organizations who share knowledge in order to arrive at an optimal decision or problem solving strategy”.(Anya et al. 2010)(Nof 2003).
Analyzing the concept of collaboration, we can identify two aspects:

- A purely technological aspect that concerns the use of collaboration tools: instant messaging, video-conferencing, e-mail, file sharing tools, discussion forums, enterprise social networks, online communities etc. We are speaking of e-Collaborations defined by Kock in 2005 as "collaboration using electronic technologies among different individuals to accomplish a common task". (Kock 2005)

- A purely social aspect that concerns the management of "team collaboration" within the company cuts across the company's organization chart, which can be re-configured dynamically as needed. The team collaboration is typically "self-organized". In the software development company, it is possible to intercept these teams, due to the source code repository (Caglayan et al. 2013). When there isn't the possibility to draw on a specific data source (a source code repository), intercepting and then directing the team is very complicated.

To better analyse the concept of collaboration and team collaboration, it is necessary to refer to the concept of knowledge workers who, in this context, take on a leading role. Drucker coined the concept of a "knowledge worker" in 1969 (Drucker 1969). In his book, *The Age of Discontinuity*, Drucker differentiates knowledge workers from manual workers and insists that new industries will employ mostly knowledge workers. The knowledge worker is characterized by several aspects that may be summarized as follows (Kayakutlu & Laurent 2012): the impact of intellectual quality is to be enhanced (Cope & Kalantzis 2009); person-to-person skills or soft skills are to be developed (Warhurst 2008); individual knowledge facilitators are to be motivated and retained in order to achieve effective collaboration (Garcia 2007). Davenport affirms that "knowledge workers have high degrees of expertise, education or experience, and the primary purpose of their jobs involves the creation, distribution or application of knowledge." (Davenport 2005)

The international scientific community has studied collaboration both from the technological aspect as well as the social aspect.

From a technological perspective, there are some interesting surveys on collaboration tools aimed at understanding the technical and functional characteristics (Schauer & Zeiller 2011); the surveys focused on SMEs when selecting tools currently on the market are characterized by communication, information sharing, electronic calendar, and project management in order to identify which of the collaborative tools would be suitable for a particular organization (Abdulrahman et al. 2015). There are studies (Al-Husain & Mirza 2010) that focus on online collaboration tools by identifying the aspect of collaboration, communication and coordination of the main features of the collaboration tool, and assuming that the use of full cooperation tools facilitates teamwork.

From a social point of view, there are studies that analyse the dynamics that exist within the team from a social perspective to discover the dynamics of collaboration and identify patterns that can be repeated in different business contexts (Ehrlich et al. 2007). There are also studies (Wamba & Carter 2014) that highlight the growing importance that these instruments have for SMEs.

The collaboration of the knowledge workers, who can do much more than they could as individuals, leads to an increased interest especially for small and medium sized companies in the use of business tools that enable collaboration.

This push by the companies, however, collides with reality. A study conducted in August 2015 from dimensional research (Alfresco 2015) was conducted on 753 knowledge workers, and highlighted on the one hand, the importance of collaboration for knowledge workers (98%) and the consequent importance of the use of technology. The alarming fact is that 71% of adults between 22 and 35 years of age and 45% of adults over 50 use their own tools and ignore those made available to them by the company. For example: knowledge workers collaborate using their personal e-mail (51%), sharing tools for public documents (51%) and non-approved tools (16%).

All this implies that:

- Corporate security is ignored and therefore relevant business information leaves the business environment in an uncontrolled manner.

- The company has not quite clear what the real business dynamics are and this generates, as will become clear later, more cost.

Therefore, it is not enough to identify a collaboration system and make it available to the between knowledge workers, but it is important to spread the culture of its use within the company. This can be made identifying tools that earn the knowledge workers' approval. You must, therefore, identify what their expectations are with respect to these tools and then choose the ones that are closest to those expectations. Of course, these expectations must not conflict with the companies' needs.

The goal of this paper is twofold:

- Identify the expectations of knowledge workers and companies in reference to collaboration tools.

- Carry out a survey of collaboration tools aimed at figuring out what is the level of coverage of these tools compared to the identified expectations.

In this paper we outlined in section 2 what are the characteristics of the tools that meet the approval of both companies and knowledge workers. What section 3 will achieve, in reference to the identified characteristics, is an analysis of the tools currently available on the market and distinguishes between social software and online collaboration. Section 4 will highlight the gaps present today in the identified systems that effectively limit the use of enterprise collaboration tools. In Section 5 we present the conclusions.

Collaboration tools: knowledge workers' and companies' expectation

To identify the expectations of enterprises and knowledge workers in reference to collaboration tools, an empirical study was conducted on three small and medium-sized companies. In particular, a total of 50 employees in each company were studied, according to a hierarchical organization distributed among 3 levels. The analysis was focused on the one hand to understand what the company expects from a collaboration tool and on the other to understand the uses that knowledge workers intend for the collaboration tools. The study, which lasted one year, focused not only on observations in the field, also in the realization of interviews and questionnaires submitted on a quarterly basis to employees and included a view to a larger study dedicated to understanding the satisfaction of each compared to software tools made available to the company.

The sample companies, operating in the ICT sector and in the textile and clothing sector, had the following features that are easy to find in most small and medium-sized companies:

- **Strong dynamism**: Often, in small and medium companies, skills are not vertically integrated but rather cover a range of different areas, so the dynamism translates into the need of having to take on different roles depending on specific contexts: the same knowledge worker is found to be the coordinator of activities within one project while operating on another project. During a single business day, the knowledge worker performs multiple tasks simultaneously.

- **Strong creativity**: Creativity is the engine of small and medium-sized companies. Often the projects are moving forward thanks to the brilliant ideas of knowledge workers for overcoming the problems, and over the course of the working day of a period of time they may emerge.

- **High level of mobility of workers**: In small companies, as well as large ones, the concept of mobility is increasingly important. Knowledge workers move to meet their customers, to make agreements, or to provide advice on specific tasks.

- **Multiple locations geographically distributed**: Small and medium-sized companies today in Italy and abroad often have more dislocated offices where there is not always a fixed staff. However there are some workspaces for knowledge workers who, for various reasons, need a space in a location different from their usual work location.

Of course for companies in the textile and clothing sector we have been considering only the knowledge workers in the sense that was emphasized in the definition by Davenport; those involved the creation, distribution or application of knowledge. We're not taking into account workers who work directly with textile machines.

From the analysis of interviews and proposed questionnaires, the following key aspects emerged for a collaboration tool from the point of view of a knowledge worker:

- **Mobility**: understood as the possibility to access the tool regardless of the device used (PC, laptop, smartphone, tablet) and have access to all necessary data.

- **Dynamic network**: the possibility of using the chat tool and video conferencing to communicate directly with other knowledge workers regardless of a defined corporate organization hierarchy chart. The tool must provide the ability to create and maintain a team that can easily adapt to deal with specific tasks to be performed. It must be possible to insert the external working team into the staff of the company (customers, new employees, etc.).

- **Integrated tools**: having within a single instrument all the tools that enable collaboration such as email, chat and video conferencing, social networking, corporate wikis, shared calendars, etc.

- **Context awareness search**: ability to always have the information they need to perform their daily work. This means to carry out targeted searches for specific needs, have the research provide the information, and make it possible to extract knowledge from information contained within the tool regardless of the channel used to produce it. Research must be functional in creating contextualized knowledge repositories respecting the skills of knowledge workers, the relationship between the various knowledge workers, the activities in which they are involved, and the data produced and used in the tool.

- **Private account usage**: very often, for simplicity and convenience, each knowledge worker uses his/her own personal accounts (on social networks, on cloud tools, etc.) also for business needs, and therefore should have a single point of access for all these tools.

The important aspects for a collaboration tool for the company are:

- **To enable sharing among knowledge workers**: it is in the company's interest to push for the sharing of data and information in order to allow a continuous exchange of know-how between knowledge workers. The human being is inclined to not share, and this is true both in private life

and at work. Knowledge workers are encouraged to share, but sharing is not a usual fact within the companies.

- **Spread:** it is important that the collaboration tool is used within the company at all levels. The collaboration tool must always be available to the knowledge worker on the move, and must represent the "virtual desktop" of knowledge workers.

- **Dynamicity**: providing a collaboration tool that can support the high level of dynamism of the companies and thus enable and facilitate the creation of teams in order to enable the sharing of knowledge within a company.

- **Private account usage**: to prevent or curb the use of personal accounts for business reasons. This is to prevent important data from being propagated on channels that cannot be controlled directly by the company.

- **Data Security**: to ensure that users' data, which make up the company's assets, are deposited in safe environments.

- **Context awareness search**: Ability to provide at all levels the right information at the right time and in the right context.

- **Cost reduction**: Think of the cost for the company arising from the fact that ideas are likely to be re-invented because the original work is not found or people ignore the existence of this work. This leads to a double cost for the company resulting from time lost unnecessarily by searching for information and from the need to produce already existing information again. Another cost comes from the fact that many times the decisions are based on incomplete or incorrect information and thus entails a business risk. Last but not least, the cost arising from the duplication of work; when two or more business units are working on the same project without knowing what has already been done and end up duplicating the effort.

- **Non-invasive**: The collaboration tools should not change the company's information system and therefore does not require set-up time and extra long information system integration.

The following table shows the relationship between the requirements of the company and those of the knowledge workers. The characteristics indicated in the left column (knowledge workers) find their correspondence, albeit from different points of view, in the right column (company).

Table 1: Comparison of knowledge workers and company's expectation

Knowledge worker	Company
Mobility	*Dynamicity* *Non - invasive*
Integrated tool	*To enable sharing among knowledge workers* *Spread*
Context awareness search	*Context awareness search* *Cost reduction*
Private account usage	*Private account usage* *Data Security*
Dynamic Network	*Dynamicity*

Analysis of social software tools and online collaboration tools

The tools that inhabit the collaboration tool are appointed E-collaboration systems (Al-Husain & Mirza 2010) which is what is meant by "…various heterogeneous system classes. There exists a large variety of open source and commercially available tools for team cooperation and collaboration. Some tools were developed out of former project management or content management systems, others put an emphasis on supporting communication with conferencing tools originated from groupware solutions". In this paper we refer in particular to two types of E-collaboration systems:

- Social Software: Dron defines social software as, "Software that allows individuals to collaborate, groups to self-organize and communities of individuals to evolve into an emergent structure"(Dron 2006). To create a selection of these tools you can analyse the latest report published by Gartner (October 2015) on Social software tools. Which we place in Visionaries/leaders quadrant. (http://www.gartner.com/technology/reprints.do?id=1-2QJAU20&ct=151027&st=sb)

- Online collaboration tools (Al-Husain & Mirza 2010) among which we selected the most popular.

The analysis of the instruments was realized through the study of commercial brochures and, where possible, using the demo installation. Importantly, many of these tools also implement useful functions for project management, but these functions are not taken into consideration for the purposes of this analysis.

With regard to social software tools, the products selected (table 2) are geared towards large companies, but can also be used by small and medium-sized companies.

Table 2: Selected tools

Gartner quadrant	Company name	Solution
Visionaires	SAP	JAM
	Google	Google App
Learders	Tibco Software	Tibbr
	Salesforces	Chatter and Comunities
	Jive Software	Jive
	IBM	Connections
	Microsoft	Yammer

Referring to online collaboration tools, those deemed significant for this paper are:

- Slack
- ASANA
- SOCOCO
- PODIO

Table 2 presents the results of the evaluation of these tools, whether or not they implement the features introduced in the previous section. For each tool we will define if there are (☑) or are not (☒) the specific characteristics.

Social software

Referring to social software, here is a detail of the characteristics defined in Table 3.

SAP JAM is a tool that integrates with SAP products. JAM also available in a mobile version for iPhone and iPad and focuses on collaboration among knowledge workers, providing long lasting working teams not only among members of the same organization, but also different organizations. SAP JAM introduces the concept of "work pattern": a template collection of experiences that facilitate the interactions with the idea that this collaboration takes place around an existing business problem. Real-time communication is integrated, although not natively: Microsoft Lync adds to SAP JAM a real time communication system

with audio-video conferencing. The installation and its management require the presence of the appropriate professionals. The spread is not guaranteed because while mobile it is possible to use only Apple devices. SAP JAM indexes every word file and PDF file and allows you to search among all documents, including events, groups and people. The research is a free type text search, but you can select an advanced filter.

Google app integrates editing tools for documents, communications (shared calendars, e-mail, chat) and file management (Google drive) in one place. Its strength is mobility: Google app lets you manage your files regardless of the device used. Google app, as an additional service from the standard allows archiving of emails and chat specifying which part of the company index, date ranges, etc. This service also allows you to manage the eDiscovery, i.e. conducting information research for legal purposes, far from a context-awareness approach.

Tibbr is a collaboration tool characterized for its simplicity. It can be integrated into various applications such as Share Point, Oracle, SAP and others, and allows you to link together different knowledge workers who work on the same project each with his/her own app. Tibbr allows you to manage your social account directly from the platform. Tibbr implements the concept of mobility allowing knowledge workers to operate with their own devices and to identify the important events around the knowledge worker who is mobile. Tibbr unifies access to files integrating Box, Dropbox, Google Drive and Huddle. Tibbr requires no installation, providing a "turn-key" solution on the Cloud; however, it can be installed on corporate servers. It is not indicated how searches are done.

Chatter and Communication is proposed as a tool designed for mobility. Much attention is devoted to the tools that enable the exchange of knowledge and the ability to create groups within which to give birth to and emergence of ideas. Salesaforce Files, integrated into Chatter, makes files accessible everywhere and continuously updated with the latest version. File searches are based on free text search, or by name, description, owner and file type. With a development effort you can integrate Chatter with Facebook and Twitter. Chatter lets you use integrated messaging tools and use screen sharing. Despite Chatter requiring installation, there are no particular problems of integration with the corporate information system.

Jive is presented as a tool that integrates several tools such as e-mail (outlook and Gmail) mobility applications, apps for Google Drive (storage, Dropbox and others) communication tools, and other third-party tools. Find people, documents, and conversations - whatever you need - with a few keystrokes. Content is prioritized and recommended based on what's important to you, your team and the projects you're working on. Jive supports the OpenSearch API too, so integrating with other repositories is a snap. The management of knowledge worker groups is very simple and intuitive. However, it does not allow integration with personal accounts such as Facebook or LinkedIn. Jive does not require any effort for integration into existing information systems, however, it does require the presence of appropriate professional figures.

Connection includes everything needed for today's Social Business: enterprise-class email on the cloud, instant messaging, online document editing, web conferencing, and file sharing. It is possible to combine your social network platform with web conferencing and collaboration capabilities, like storing and sharing files. IBM integrates all the connections of useful collaboration tools to share knowledge. All documents within the platform are indexed. The content type in which the search is made depend of the application. For example, research in the attachment file content is only performed in the Activities application, file and search Wiki. The compartmentalized channel search effectively excludes the possibility of having investigations context awareness, as it does not integrate information from different channels.

Yammer is a collaboration tool designed to facilitate teamwork and allows for collaboration with users outside the company, such as customers and partners. Yammer integrates instant messaging tools and lets

you share information. Yammer can be used with Apple's mobile devices, Android and iOS. Yammer uses the Open Graph protocol to collect third-party content in a deeper, more structured way than traditional web crawling technology. To protect privacy, Yammer also carries over the access rights and permissions set in third-party applications. For example, only users with access to view a file in SharePoint will be able to see that file in Universal Search. Integration with Facebook is not provided natively, but it need a minimum of development effort. There is, however, integration with other social networks. Yammer is designed as a SaaS application and is not available to install on a local server. The effort towards integration in the existing information system is, therefore, minimal.

Online collaboration tools

The element that distinguishes the online collaboration tools being analyzed is the desire to eliminate the use of e-mail. The universal theme that covers all three of these tools is the fact that “smart” communication is achieved by the use of messaging tools, and can replace email, therefore reducing the management effort and simultaneously shortening the approval procedures.

Slack looks like a classic messaging application, with the added possibility of integrating a long list of services including Dropbox, GitHub, Google Drive, Hangouts, and Twitter. Once registered, the team's users can divide the topics of discussion, exchange files using hash tags, and then create thematic channels. It is possible to use the integrated chat tool even if there isn’t the possibility to create a group chat. Slack does not integrate with Facebook, presenting itself instead as a tool that replaces it. Once you create the domain for a specific company, users are free to sign up with the company's account or a personal account. The free text search allows you to find both the messages exchanged between the various collaborators and the files that contain the keyword. Slack, also available for mobiles, is totally non-invasive with regard to the company's information system.

Asana, again with the goal to reduce e-mail exchange, looks and acts like an email inbox for group projects with the ability to add dates, "likes" and stars for important items in one place. It integrates with a number of other third-party sites including Google Drive and Slack. Asana can be used while mobile and with the personal account of the individual employees. It does not integrate with other social networks, but is itself a social network that helps manage workgroups. Asana integrates with many third-party applications such as Dropbox, Google Drive, Slack and many others.

Sococo creates a virtual workspace for teams to connect as if they were in a real brick and mortar building. Each team member gets their own "office", which even has a door you can shut to have privacy. It's a great way for teams to bond, have spur of the moment meetings (or virtual happy hours) and see who is "in the office" (or online and available). The downside to Sococo is that there is no file sharing inside chat windows. There are not enough restrictions on what they can do with your data. Sococo integrates with Google drive. It also allows integration with Slack, even if it does not natively, and then you can see its characteristics.

Podio is the web and mobile solution for enabling collaboration within the company. It integrates collaboration tools, integrates with Dropbox and Google Drive, as well as with box, OneDrive and other virtual folders. Research can be done on Podio as a keyword search that helps you find documents and materials within Podio. Integration with Facebook is not native, but you can achieve integration with external tools.

Discussion

The table 3 analyses collaboration tools currently in the commercial and in the open source landscape, and analyzed them with respect to the features that from our empirical analysis, both knowledge workers and

companies want. It emerges immediately that all tools may be used in mobility and, although to a different extent, all integrate collaboration tools such as chat, blog, shared calendars, etc. It also shows how online collaboration tools are trying to eliminate the use of email and this goes against the trend compared to the expectations of knowledge workers. On the contrary, they would like to manage the business collaboration tool, even with their own personal email. In this regard, it is clear that only 4 out of 11 analyzed tools allow knowledge workers to use their personal accounts. If this is prohibited by corporate security policies, it may be a factor that determines the non-use of the tools by knowledge workers. All tools are careful about data security and only 2 of 11 require an integration effort into the company's information system: the other tools are simple to install and configure, even without the presence of experienced staff. All analyzed tools allow the exchange of knowledge between the knowledge workers, a key factor for companies that have an interest in capitalizing on the tacit knowledge present in the company.

Information research management is, however, particularly critical.

All analysed tools implement, in fact, a free-text type search that finds the specific post, file, article, etc., which contains your search term. But, this is far from a contextual search, which in turn, both knowledge workers and businesses would like to have in the collaboration tool. In some cases (Google App), the search is implemented to respond to legal requirements; in other cases (Connection) there is a vertically integrated research application (chat, blog, etc.) in the system and therefore it cannot provide integrated information with respect to user needs.

The analysis shows that in order to ensure maximum use by the knowledge worker, it is important that the tool have two key features:

- Use a single tool for both business accounts for personal ones, thus integrating privacy and business life.
- Enhance the search to present the information needed in order to allow the user to always have the right information, at the right time and in the right context.

Another feature, which is not found in the analyzed tools, is linked to the need to reduce the costs related to the management of information. It is obvious that this feature is an immediate consequence of the strengthening of research.

Conclusions

In this paper, focused on business collaboration tools, we have reflected on the main features knowledge workers and companies expect from a collaboration tool.

The presented features are used to compare systems according to functional collaboration and their true coverage of activities within team collaboration setting standards. The evaluation of the reviewed systems deduces that the main shortcoming of the collaboration systems lies in research management. Despite the fact that all the instruments dealt with indexing, the results presented to the user are, at best, a list of files, blog posts, etc. absolutely out of context given the specific task of the collaboration. This clashes with the needs of both knowledge workers who would like a system that would facilitate their daily work, and with companies that would like to preserve the company's know-how and above all to reduce the costs of the management of information.

The impact of CSR on company's stock price: Evidence from Bucharest Stock Exchange

Adina Dornean, Alexandru Ioan Cuza University of Iasi,
Iasi, Romania, e-mail: amartin@uaic.ro

Dumitru-Cristian Oanea, Bucharest University of Economic Studies,
Bucharest, Romania, e-mail: oanea.cristian@gmail.com

Abstract

This paper aims to analyze the impact of Corporate Social Responsibility (CSR) on stock price and other market variables, such as dividends and stock return for the companies listed on Bucharest Stock Exchange (BSE).This study investigates the differences in the market variables of companies that show CSR compared with those that do not. Based on three statistical techniques applied in our analysis, namely: discriminant analysis, probit analysis model and logistic regression, we highlighted that stock price is the main driver for CSR activities of a company, while the others – dividend and stock return – don't have a significant impact. Moreover, the best predicting model is probit analysis model and logistic regression, with an average correct classification of 65.82%.

Keywords: CSR, stock price, company performance, BSE companies.

Introduction

Corporate social responsibility (CSR) attracts considerable attention among academics, practitioners and mass-media. Yet understandings of CSR and the fields of analyses vary across the discussions and groups of those who are interested in.

CSR become in the last decades a "business model" and a "risk management", and also at international level was adopted ISO 26000, which is recognized as the CSR international standard.

Furthermore, the way of implementing CSR into a company varies between the organizations. If some firms prefer to include the CSR responsibility under existing departments such as human resource, public relations or business development, other companies prefer to create a separate CSR department. In the same time, there are also companies without a defined structure and objectives for CSR activities.

The importance of CSR activities is well recognized both by academics and practitioners, because CSR has many benefits for a company, among which we can mention the fact that it helps the company to hire and to retain personnel, brand awareness, improves the relationships with suppliers, and also helps the company to improve its public image. Of course, there are also some criticism in the literature regarding CSR activities, because the main purpose of a business is to bring added value for its shareholders, while CSR will spend this value.

Despites of all this contradictories and different opinions in the economic literature regarding CSR, this is still a very important topic for all companies and this is the reason why we proposed to analyze it in this paper.

The paper is organized as follows: the second section reviews the literature regarding the CSR concept, the impact of the recent financial crisis on CSR and also the relationship between social responsibility and stock

market performance of companies showing different results. The third section presents the methodology used in order to capture the impact of CSR on market variables of the companies and also a descriptive statistics of the main data used in our analysis. In section four we will report the results and the main findings of our research. Finally, we present the conclusions of our study.

This study, which is limited to companies listed on the BSE, has significant practical implications because it can motivate potential investors and/or the public at large to decide to invest in companies that demonstrate a high degree of CSR and improve policymaking through appropriate policies or incentives for CSR activities. This paper is an original research paper that presents new empirical findings and it adds to the literature on this topic because of its policy implications.

The CSR concept

In literature there are many papers about this issue, although not all unanimous, but following we will highlight a few of them. CSR definition is both complex and complicated. According to The World Business Council for Sustainable Development (WBCSD): "Corporate social responsibility is the commitment of business to contribute to sustainable economic development, working with employees, their families, the local community and society at large to improve their quality of life" (Holme and Watts, 2000).

European Commission (2016) considers that "Corporate social responsibility (CSR) refers to companies taking responsibility for their impact on society". Also, the European Commission believes that CSR is important for the sustainability, competitiveness, and innovation of EU enterprises and the EU economy because "it brings benefits for risk management, cost savings, access to capital, customer relationships, and human resource management."

Sheehy (2015) applies a scientific definitional approach of genus, differentia and species to arrive at a definition of CSR as international private business self-regulation.

In other approach (Silberhorn and Warren, 2007), CSR is presented as a comprehensive business strategy, arising mainly from performance considerations and stakeholder pressure. In this context, companies focus on how they interact with stakeholders and how business activities impact on society because most CSR policies addressed community, employee and customer issues. In their opinion, the CSR objective is to increase "quality of life". Their main conclusion is that "business and CSR strategy appear to be on a convergent path, making business and CSR integration across the company the norm in future".

Ratajczak (2015) undertook a research on business opinions on the concept of CSR in the second half of 2013 and included 174 micro, small and medium enterprises from the agribusiness sector engaged in business activities in the rural areas of the Warmia and Mazury (Poland). The results obtained by the author of the study showed that more than half of the surveyed entrepreneurs do not know CSR at all. Thus, there is a need to supplement these shortcomings by providing knowledge and information about CSR.

It is very interesting the Islam perspective (Ahmad et al., 2015) regarding the concept and elements of CSR. The authors explain the CSR and its components: faith, morality and legal rulings. Also, they highlighted that Allah's consciousness is central and focal point to establish the relationship of man with Allah and toward the activities of this world.

Other authors (Argiolas, 2006) tried to delineates the key drivers of Corporate Social Orientation that in some way takes in, includes, and transcends the previous, implying the adoption of social dimension as background reference in defining its way of being and operating.

Thus, we can conclude that CSR is a form of corporate self-regulation integrated into a business model. That is, CSR is the decision-making and implementation process that guides all company activities in protecting

and promoting international human rights, labor and environmental standards, and compliance with legal requirements within its operations and in its relations to the societies and communities where it operates (Carroll 1999).

CSR and financial crisis

The 2007–2009 financial crisis caused many to question the basic premises of the current business system (Kaletsky, 2010) and the financial services industry. Some authors (Porter and Kramer, 2011) suggest that corporations should aim to regain legitimacy by pursuing shared value rather than mere financial value.

In this context, researchers analyzed the effects of financial crisis on CSR practices and they tried to quantify the link between CSR and financial crisis. The results of Stoian (2013) showed various opinions on attitude that companies should undertake in financial crisis: to cancel the CSR actions, to freeze the CSR actions or to be involved more in CSR actions. Despite this, he recommended that companies continue their CSR efforts in periods of financial crisis due to the fact that would mainly bring positive results for involved companies only in mid and long-term basis.

In another study (Yelkikalan and Köse, 2012), the effects of the crisis on CSR activities have been evaluated in the light of the developments following the 2008 global financial crisis and a model is proposed. As a result of the identifications regarding the theoretical background for perception of the crisis as a threat or opportunity for CSR activities, both two situations are presented together in the proposed model and serve the survival or long-term profitability of the business.

Giannarakis and Theotokas (2011) evaluated empirically the effect of financial crisis in CSR performance, based on companies that implement Global Report Initiatives (GRI) reporting guidelines modifying the application level in a point score system. Their results indicate increased CSR performance before and during the financial crisis except for the period 2009-2010. Companies increase their performance in order to regain the lost trust in businesses.

Also, Jacob findings (2012) show us that the financial crisis of 2008 had a clear impact on CSR initiatives in many companies because of the exceptional pressure that they had to face in order to survive and with massive layoffs and expenditure cuts on community involvement programs being the most obvious outcomes of the crisis. However, not all impacts were seen as negative, many CSR issues were pushed forward and gained more depth after the crisis, such as organizational governance and environmental policies, as well as compensation policies. According to his study, the main stakeholders that were affected by the crisis were employees, followed by investors and customers; and labor practices were the most severely impacted.

In Romania, “responsible corporate behavior was initially evaluated based on commercial considerations of image and reputation, and not in terms of sustainable development or stakeholders needs” (Sitnikov, 2015). The author also noticed that recently “there has been a shift towards the implementation of the second approach, responsible practices being associated with long-term success, directly proportional to community development, environmental welfare and practices and connections within the area of influence”. Even so, and taking into account the progress after EU accession, a number of challenges continue to exist, which must be addressed by all stakeholders, including increasing awareness of CSR and of the integrated approach involved by the implementation of responsible practices; increasing awareness of the needs and benefits associated with incorporating responsible practices into business objectives and operations to ensure sustainable success; and increasing transparency, monitoring and assessment of CSR initiatives impact on all involved or affected stakeholders.

Another study (Serbanica et al., 2008) regarding CSR in Romania underline the fact that the concept of CSR is still new and not well-known in Romania and define CSR policies under the concept of sustainable

development and cover economic, social and environmental aspects. In their opinion, the corporations that adopt CSR policies are mainly concerned by their reputation and image but corporations may include in their CSR policies a specific Human Rights commitment, respect of legal obligations, as well as charity.

Thus, Simionescu and Dumitrescu (2014) analyzed the impact of financial crisis on CSR practices and their performance during the financial crisis for the companies listed on Bucharest Stock Exchange that are active in CSR. The results suggests a positive link between CSR practices and companies financial performance. Moreover, this paper underlines the benefits of CSR practices as a strategy for long term business leading to competitive advantage and win-win opportunities.

Another study that aimed to identify the link between CSR and the recent financial crisis, and to determine the main features of the companies' responsible behavior during this period was undertook by Zaharia and Grundey (2011) based on examples of CSR for Romania and Lithuania. The authors arrived at two major conclusions: the first one is that CSR is on a turning point and it is expected that a new orientation toward theoretical and practical approaches regarding the concept will be developed after this crisis. The other outcome reveals the contradiction between discourse and action: companies' priorities in crisis time are more concentrated on financial aspects; even if at the discourse level all companies declare their commitment to responsible actions.

CSR and stock market

There exist a limited number of papers discussing CSR published in recent years in the top academic finance journals, which suggests that this topic does not appear to be a main concern in the finance literature. According to Goss and Roberts (2011, p.1794), "The debate over the merits of CSR revolves around whether such investments are value enhancing or whether they are the value-destroying manifestation of agency conflicts". Much of the discussion of CSR in the finance literature revolves around the argument that where CSR does not directly increase shareholder value, it is an inappropriate misallocation or misappropriation of funds. This idea is according to Friedman's (1970) arguments: he consider the philanthropy in the form of CSR that does not enhance firm value is considered a misallocation because the shareholders themselves should be determining whether and how to donate their funds. Brown et al. (2006) found that giving does enhance shareholder value.

In order to demonstrate this, Waworuntu et al. (2014) analyzed the impact of CSR on ASEAN listed companies and they found that companies are aware of the need to disclose their approach regarding sustainability. Also, they demonstrate a moderate positive correlation between all Corporate Social Performance (CSP) and Corporate Financial Performance (CFP) variables.

In the case of companies listed on the Athens Stock Exchange, Tsaklanganos (2012) indicate that very few of the investigated market variables—stock price, stock returns, earnings per share, and dividends—play a role in discriminating between these two categories of companies (companies with or without CSR), while firm size plays almost no role at all.

In an earlier study, Alexander and Buchholz (1978) analyzed the relationship between social responsibility and stock market performance of corporations in the U.S. for the period 1970-1974 and they found a low insignificant relationship between risk-adjusted performance and degree of social responsibility.

Although prior research has addressed the influence of CSR on perceived customer responses, it is not clear whether CSR affects market value of the firm. Luo and Bhattacharya (2006) developed and tested a conceptual framework, which predicts that (1) customer satisfaction partially mediates the relationship between CSR and firm market value (i.e., Tobin's q and stock return), (2) corporate abilities (innovativeness capability and product quality) moderate the financial returns to CSR, and (3) these moderated relationships are mediated by customer satisfaction. Based on a large-scale secondary data set, the results show support

for this framework. The authors found that in firms with low innovativeness capability, CSR actually reduces customer satisfaction levels and, through the lowered satisfaction, harms market value.

Despite the positive societal implications of CSR, there remains an extensive debate regarding its consequences for firm shareholders. The research of Mishra and Modi (2016) made on a sample of 1,725 firms for the years 2000–2009 indicates that the effects of overall CSR efforts on stock returns and idiosyncratic risk are not significant on their own but only become so in the presence of marketing capability. Furthermore, the results reveal that although marketing capability has positive interaction effects with verifiable CSR efforts—environment (e.g., using clean energy), products (e.g., providing to economically disadvantaged), diversity (e.g., pursuing diversity in top management), corporate governance (e.g., limiting board compensation), and employees (e.g., supporting unions)—on stock returns (and negative interaction effects with these CSR efforts on idiosyncratic risk), it has no significant interaction effect with community-based efforts (e.g., charitable giving).

In this context, in order to add more results to those that are existing, we conducted an analysis on listed companies on Bucharest Stock Exchange.

Methodology

In order to identify if the CSR activities of a company have impact on the stock price, we use three statistical techniques, namely: discriminant analysis (DA), probit analysis model (PA) and logistic regression (LR). The reason in choosing these statistical techniques is that we want besides to see the relationship between CSR activities and stock price, also if the market variable of a firm, such stock price, paid dividend, and stock return can be used as predictors in classifying the companies in those which have CSR and those which don't have CSR activities.
Going further, even if according to Bucharest Stock Exchange (BSE) it is mandatory that each company to apply social responsibility in all its actions, only a part of them are really doing CSR activities, that's why based on these three techniques, we will be able to predict if a company have CSR activities using market variables.
The first method, discriminant analysis, was proposed by Fisher (1932), and shows the best linear regression of independent variables which will best discriminate the groups included in the dependent variable. The implicit assumptions of applying DA require the data to be normally distributed. The discriminant equation which will be estimated in our analysis is expressed by relation (1):

$$CSR = \alpha_0 + \alpha_1 \cdot P + \alpha_2 \cdot D + \alpha_3 \cdot R + \varepsilon \quad (1)$$

where CSR – is the dependent variable, equal to 1 if company has CSR activities and 0 otherwise; P – stock price; D – paid dividend, R – stock return, $\alpha_0, \alpha_1, \alpha_2, \alpha_3$ – the discriminant coefficients and ε is error term.
Based on discriminant analysis we will be able to see if the classification of companies based on CSR activities depends on at least one of the market variables: stock price, paid dividend or stock return.
The second approach, probit analysis model, transforms the linear combination of independent variables to cumulative probability from the normal distribution. In our case the PA will be estimated based on equation (2):

$$prob(CSR = 1) = \phi(\alpha_0 + \alpha_1 \cdot P + \alpha_2 \cdot D + \alpha_3 \cdot R) \quad (2)$$

where CSR – is the dependent variable, equal to 1 if company has CSR activities and 0 otherwise; ϕ - the value from the cumulative normal distribution; P – stock price; D – paid dividend, R – stock return, $\alpha_0, \alpha_1, \alpha_2, \alpha_3$ – the coefficients in linear combination of explanatory variables.

The last approach, logistic regression, is similar to probit analysis model, but the difference between these two techniques lies in the assumption regarding the error distribution. If for PA it states that the error are normally distributed, for logistic regression the errors are standard logistic distributed. In our case the LR will be estimated based on equation (3):

$$(3) \qquad \log\left[\frac{prob(CSR=1)}{1-prob(CSR=1)}\right] = \alpha_0 + \alpha_1 \cdot P + \alpha_2 \cdot D + \alpha_3 \cdot R$$

where CSR – is the dependent variable, equal to 1 if company has CSR activities and 0 otherwise; P – stock price; D – paid dividend, R – stock return, $\alpha_0, \alpha_1, \alpha_2, \alpha_3$ – the coefficients in linear combination of explanatory variables.

Data and descriptive statistics

All companies listed at Bucharest Stock Exchange were selected in our analysis. From these we had to exclude 5 companies due to data availability, so the final sample is formed by 79 companies. From these 79 companies, only 29 of them have done clear CSR activities, which are publically presented on their website or annually reports.

The selected companies, based on the industry classification can be seen in table 1.

Table 1. Companies' classification base on industry membership and CSR activity

Industry Classification	Number of companies	Companies having CSR
Machinery of Industrial Equipment	18	6
Investments fund	9	2
Construction Materials	6	2
Manufacturing rubber products	5	3
Real Estate	5	3
Transportation Services	4	0
Trade	4	2
Hotels	4	1
Banks	4	1
Specialized Chemicals	3	2
Electricity	3	1
Consultancy	3	0
Medical products	3	1
Food and beverage industry	2	2
Manufacturing industry	1	1
Technology – Electrical Office Equipment	1	1
Raw Materials – Aluminum	1	0
Industry Suppliers	1	0
Computer Materials	1	1
Clothes and Accessories	1	0
TOTAL	**79**	**29**

Due to fact that the last available annual reports for the companies listed on BSE are for 2014, all the market data was computed for the year 2014. The stock price of each company was calculated as the average stock price for year 2014, the dividend value is the value of dividend given by each company in 2014. For the

companies which didn't pay dividends in 2014, the value is equal to 0. Finally the stock price return for 2014 was calculated based on the final and initial price from the year, accordingly to relation (4):

$$R = \frac{P_f - P_i}{P_i} \cdot 100 \quad (4)$$

For linearization of the data, we apply logarithmic at the value of stock prices.

The main descriptive statistics for the selected market variables for analysed companies are presented in table 2. At a first glance, we are able to see some differences in the mean of market variable between the 2 groups: companies with CSR and NON-CSR companies.

Table 2. Descriptive statistics for analyzed variables

Variable	Mean	Median	Max	Min	Std. Dev.	Skewness	Kurtosis
CSR companies							
Price	17.0195	1.2786	211.2934	0.0439	42.9804	3.6013	15.9928
Dividend	3.5879	3.2700	12.5500	0.0000	3.8155	0.5917	2.1788
Stock return	8.22%	3.57%	85.49%	-63.06%	30.68%	0.3667	3.4700
NON-CSR companies							
Price	4.6049	0.4521	78.8224	0.0082	13.4292	4.2519	21.7157
Dividend	2.4526	0.0000	13.5600	0.0000	3.5068	1.4245	4.3322
Stock return	11.07%	3.49%	170.49%	-54.73%	43.01%	1.7834	6.3141
ALL companies							
Price	9.1622	0.6545	211.2934	0.0082	28.5078	5.2763	34.7568
Dividend	2.8694	0.0000	13.5600	0.0000	3.6407	1.0739	3.2133
Stock return	10.02%	3.57%	170.49%	-63.06%	38.76%	1.6217	6.6111

The average stock price for the CSR companies (17.02 RON) is 4 times higher compared with NON-CSR companies (4.60 RON). Similar difference we can see also in the dividend value, CSR companies giving an average dividend of 3.6 RON per share and NON-CSR companies give an average dividend of 2.45 RON.

The situation is different when we analyse the stock return of the 2 groups of firms. In this case the higher value of stock return is recorded by NON-CSR companies: 11.07%, compared with only 8.22% for CSR companies.

Table 3. Normality test: Kolmogorov – Smirnov

Variable	CSR companies		NON-CSR companies	
	Statistic test	Prob.	Statistic test	Prob.
Dividend	0.242	0.000	0.318	0.000
Ln(price)	0.124	0.200	0.088	0.200
Stock return	0.135	0.189	0.215	0.000

This is not an abnormal situation, because it can be explain by the economic theory. According to Gordon model (Gordon and Shapiro, 1956), the stock price is the ratio between dividend and expected stock return (if we assume the growth rate for dividend equal to 0). According to data presented in table 2, the ratio between divided and stock price for NON-CSR companies is higher (52%) than the same ratio calculated for CSR companies (21%), so it is understandable based on Gordon model that the stock return for NON-CSR companies, to be higher that stock return for CSR companies.

In order to test the normality, we will use Kolmogorov–Smirnov test. As shown in table 3 stock return and price for CSR companies are normally distributed, while the divided series is not. For the NON-CSR companies, we can see that only price is normally distributed.

Results

The best fitting model is selected by estimated the three statistical techniques mentioned in methodology: discriminant analysis, probit analysis model and logistic regression. The estimated coefficients for each model are given in table 4.

Table 4. Regression models estimation

Variable	Coefficient		
	Discriminant analysis	Probit analysis	Logistic regression
Constant	-0.058	-0.375*	-0.609*
Dividend	0.067	0.022	0.036
Ln(price)	0.406**	0.140**	0.227**
Stock return	-0.004	-0.155	-0.242
Eigenvalue	0.076	0.054	0.054
Correlation	0.266	0.367	0.367
R-squared	5.548*	5.711*	5.658*

*,**,*** - Indicates significant at the 0.1 level, 0.05 level and 0.01 level

In all models only stock return is the only significant and the most discriminating variable and contributes positively.

Having calculated the value for discriminant coefficients for each model, further can be calculated the discriminant scores for each company in the sample, and to assign to one of two groups: CSR companies and NON-CSR companies.

Table 5. Classification Table for Groups (Percentage Correct – Overall Index)[a]

Model		CSR = 1	CSR = 0	Total
Discriminant analysis (DA)	CSR = 1	32	18	50
	CSR = 0	12	17	29
	Total	44	35	79
	Correct	32	17	49
	% correct	72.72%	48.56%	**62.03%**
Probit analysis (PA)	CSR = 1	44	21	65
	CSR = 0	6	8	14
	Total	50	29	79
	Correct	44	8	52
	% correct	88.00%	27.59%	**65.82%**
Logistic regression (LR)	CSR = 1	44	21	65
	CSR = 0	6	8	14
	Total	50	29	79
	Correct	44	8	52
	% correct	88.00%	27.59%	**65.82%**

[a] – Cut-off point: 0.50

In table 5 is reported the classification results using all three models. We can see that both probit analysis and logistic regression, has the best average correct classification (65.85%), compared with the discriminant analysis which has only 62.03%.

Conclusions

The aim of this paper was to analyze the relationship between companies' CSR activities and stock price performance, for listed companies on Bucharest Stock Exchange in 2014.

Even if BSE introduced a mandatory code through each all companies must to adhere to the corporate social responsibility, from 84 listed companies, only 29 of them have clear activities regarding CSR.
Further we wanted to see if the market variables can be good discriminant in order to classify the firms in CSR companies and NON-CSR companies, by using three statistical techniques: discriminant analysis, probit analysis and logistic regression.

Analyzing the descriptive data for each group of companies, we were able to see that the average price and average dividend are higher for CSR companies, compared with NON-CSR companies. In the same time, the stock return is higher for NON-CSR companies.

Based on the estimation of three selected models, we pointed out that stock price is the main market driver for the CSR activity of a company, while the other two variables, dividend and stock return, don't have a significant impact.

Our results are logically through economical point of view, because usually companies having more valuable stocks on the market have the necessary resources to be involved in some CSR activities.

The analysis pointed out that the best predicting model is probit analysis and logistic regression, with an average correct classification of only 65.82%, which can be considered a limitation of the paper. Further research can extend the analysis through the number of discriminants included in the models, by taking into account financial ratios, such as ROE, debt to equity ratio, working capital ratio, and not only.

Abstract

The article focuses on the special properties and measurement of productivity related to these properties in the service sector. The approaches to measurement of public sector workers productivity are recommended. The dependence between the salary of academic staff and the main indicators of universities activity is analyzed. Motivation improving recommendations for employees of services sector are substantiated.

Key words: labour productivity, service sector, labour intensity, motivation, universities performance indicator.

The labour productivity is an integrated characteristic of economic and social development of enterprises and sphere of activities. Therefore, The International Labour Organization recommends using productivity indicators in the manufacturing and non-manufacturing sectors of economy (services, management activities, civil service and business information).

The services sector has a number of distinguishing features compared with manufacturing; in particular, it has a high volume of labour costs directly related to the customer service, low productivity and lack of convincing productivity measuring procedures in some cases, which is not conducive to its growth. The impact of the budget sector of economy on the growth of labour productivity in the real sector determines the necessity of a competent implementation of motivation and stimulation of the state employees work.

Labour productivity growth has become increasingly important in the service sector as a condition for reducing the production costs. All this leads to the relevancy of the issues.

Objective

The main purpose of our article is to offer the approaches to measurement productivity in the public sector. To develop recommendations for labour productivity improvement. To substantiate a hypothesis of predominance in education sector the strong non-monetary motivation to work and to develop recommendations of improving motivation of education sector workers.

Literature review

In modern Russian economic literature, the problems of productivity improvement are considered in the works of Volgin N.A. (2002), Genkin B.M. (2007) Kokin J.P. (2010), and others. The main focus is on the identification of factors and reserves of labour productivity growth. As the labour productivity indicators there were considered the labour intensity and output of production.

The main feature of foreign methodology of productivity calculation is the fact that foreign scientists propose to evaluate and analyze the productivity of all production factors but Russian specialists do the main emphasis, as already noted, on the assessment of the human labour productivity.

Foreign approaches to labour productivity management in the modern economic literature presented in the works of P.F. Drucker, (2003), K. Kurosawa (1980), A. Lawlor (1973), I. Maasaki (1986), M. H. Mescon, S. Moss (1982), F. W. Taylor (1911), J. Devan, A. Millan, P. Shrike (2005) and others.

Recent developments of A. Lawlor (1985) and K. Kurosawa are the most known among foreign techniques of labour productivity calculation. A. Lawlor (a member of the UK Commission for Employment and Skills) considers productivity as a comprehensive indicator of the organization of production efficiency and offers following steps in productivity improvement: goal definition, calculation of efficiency coefficient, effectiveness evaluation, conducting comparability of results and development of specific measures.

Lawlor's concept based on the fact that the purpose of organization proceeds from certain amount of funds that are necessary for production maintenance costs, salary payment, fixed capital investment, profits and tax deductions.

The main estimated indicator in this method is efficiency coefficient, which shows how much of required products are producing from existing resources; in fact it determines the degree of capacity utilization. The production profitability is estimates by this indicator as the ratio between the volume of production (production costs plus profit) and production costs. Determination of the effectiveness is based on a comparison of achieved and design results with more efficient management of resources as the ratio between the volume of production (standard calculated amount that could be achieved) and production costs.

The productivity measurement method of K. Kurosawa (Professor of Tokyo Institute of Technology) based on a system of interrelated indicators characterizing the organization of production effectiveness for the certain period of time. A distinction is made between the individual, overall and total productivity.

In foreign sources, the problem of productivity improvement presented, mainly as a description of quantitative methods for assessing separate productivity indicators (K. Kurosawa, S. Moss etc.) but approaches to its management considered mainly applied to the material production.

Focusing on issues of labour productivity, labour productivity in its classical approach is measured by output, i.e. the number of products produced by one employee per unit of time or per average employee in a calendar period.

The main components of productivity measurement are presented on Fig.1 (Bazarov T.J.,1996)

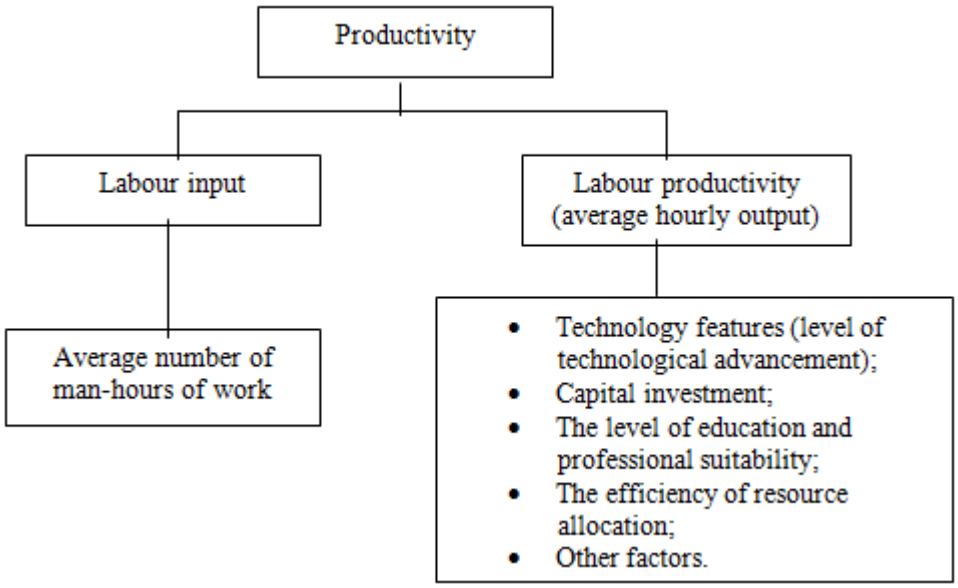

Fig.1. The main components of labour productivity

Productivity is linked to both the amount of labour (for example, the number of man-hours) and the quality of work (for example, the quality of staff) as seen on the fig.1.

It is possible to define the output or labour-intensity of product more or less accurately only in very simple activities, mainly in manufacturing.

The services sector, as noticed before, has a number of distinguishing features compared with manufacturing; in particular, it has a high volume of labour costs directly related to the customer

service. These operations are difficult to mechanize and automatize, what determines the high share of living labour costs in the total costs of services production.

American scientists W.J. Baumol, W.G. Bowen (1966) described the phenomenon that productivity growth in the service sector has generally lagged behind that of the material production sector. This phenomenon called as "Baumol's disease." It is due to the fact that scientific and technological progress and the replacement of human labour with materialized (physical) capital are slower in the service sector, including the social sphere, than in the production of material goods. As a result, the complexity of services in social services is higher than in manufacturing industries.

Indeed, the highest labour productivity in Russia at the moment - in the fields of oil and gas production. Efficiency in this sector exceeds the average efficiency of the country by 7 times. People who work for the state are much less effective than the commercial sector workers.

According to William Baumol, today the costs of health care, education, and live performing arts are rising almost everywhere at a rate significantly greater than the economy's rate of inflation. The disease is chronic, because these activities are inherently inhibit innovation, which saves the labour costs, as the nature and quality of these services require immediate investment of human labour.

It should be noted that not all economists agree with Baumol, explaining their position in following way, that serious doubts arise from labour productivity measurement tool in the service sector, what allowed Baumol to draw conclusions about the "chronic disease."

Service sector is non uniform, accordingly for purposes of productivity measurement, services are classified as follows:

1) mass-market-oriented services, with easily identifiable units of output and simple manner of monetary value (transport, car service, hotels, etc.). In this case, the procedure of productivity measuring is similar to that for material production;

2) services the productivity in the conventional economic sense should not be calculated for (for example, artists and others);

3) services the end result of which is poorly identified, for example - education, health.

Regarding the last subgroup it should be noted that there is no convincing measuring procedure, so we will look closer to the issues of productivity measurement in relation to this part of the service sector.

Collins J., Porras J (1994), Ruddle K., Feeny D. (1998) and many other scientists were working on issues of motivation.

It is subconsciously associated with the Maslow's pyramid (A. Maslow, 1943), which states that every person has five levels of needs satisfaction and while the lower level needs are not satisfied, it makes no sense to motivate a person on the basis of more complex needs. A similar idea underlies the X and Y McGregor's theory (D. McGregor, 2005).

Not without interest are modern theories of motivation (goal setting, justice, etc.) (D.C. McClelland, 1984). However, using western theories of motivation to the Russian practice does not give the desired result, and motivation in the best is monetary.

Methodology

112 universities of Volga Federal District were selected as study objects.

Materials for the research were obtained from open sources.

We used OLS method (ordinary least squares method) to determine the effect of salary on basic indicators of universities activity, which was implemented in two phases:

1) specification problem solving - selection of the most suitable paired dependence on minimum error of approximation and/or a maximum coefficient of determination;

2) analysis of obtained models quality indicators for the statistical significance of paired regression equations coefficients by Student and the reliability of equations by Fisher.

The results can be used to explain the cause-and-effect relationship between wages and quality indicators of higher-education teaching personnel activity, and for the planning of their creative growth.

Results

First of all, it should be stated that the question of necessity to find reserves to increase the labour productivity in the health and education itself sets the wrong strategic benchmark inasmuch as the fact that relating to many of creative (not routinely) types of work the idea of measurement and increasing its productivity in the classic sense is meaningless at all. In addition, we must not forget about the effect of interactivity: efficiency (productivity) of teachers' and doctors labour no less than on them, depends on who they work for - students and patients.

It is much easier to measure the labour intensity of the considered sector workers than productivity. Unfortunately, the two concepts are often confused with each other. Speaking about necessity to increase the labour productivity in the public sector, essentially it means the increasing of labour intensity of public-sector employee. The Minister of Finance in his speech made a call for an intensity increase, offering to link more closely the salaries of teachers and doctors with hourly load and duration of holidays. He stated this during the meeting of the Federation Council, which took place on September 25, 2013. "We have a number of budget sectors, which have the reduced number of hours in a work week. However, wages should be equal to the economy average. But the economy average hours of work week is much more than in any given budget industry ", - said the head of the Russian Finance Ministry.

But, as opposed to productivity, the intensity is a measure of the load, rather than the result of labour. The growth of labour intensity leads to deterioration in quality and vice versa - reducing the intensity to normal levels positively affects the quality of work and the state of psychological climate in the collective. "Greeks and Russians spend more time at work comparing to others all over Europe but the performance indicators in these countries are not very high".

The growth of labour intensity can be highly dangerous in creative activities, where made product is nonstandard and intangible. That product’s quality is difficult to assess. Such activities preponderate in the public sector. Therefore, as a strategic benchmark for public sector development it is better to choose the quality of work results and its effectiveness rather than productivity, not as the ratio of results and costs (efficiency) but as goal achievement level (effectiveness).

Public organizations generally do not produce the commercial products and authors tend to think that the rights to provide limited services on a commercial basis it is an coercive measure, which has a number of medium and long-term negative consequences. Since budget organizations provide variety of administrative and social services with different complexity, it is necessary to develop key performance indicators for each position of each budget organization (KPI).

For the KPI development in the public organizations it is advisable not to focus on the process approach, assumed as description and optimization of company’s business processes, which is worked out for a very small number of Russian companies, but on the functional approach (Fig. 2). In accordance with this approach, efficiency indicators at different levels (organization, department, and employee) are developed based on company objectives and official functions of managers and unit employees. At the organization level the appropriate KPI selected or developed for each target, it gives the possibility to assess the goal achievement level. It is similar at the departments and employees level – there is one or several indicators selected for each function, these indicators directly or indirectly assess the level of function fulfilment. Since the function of units derived from the business goals decomposition and staff functions logically derived from functions of departments, the KPI of staff will provide the KPI of divisions and KPI of departments, in their turn, will "work" for KPI of organization. Indicators of different levels are interlinked as cause and effect. Thus, the organization goals consistently pass "top-down" on the level of departments and employees.

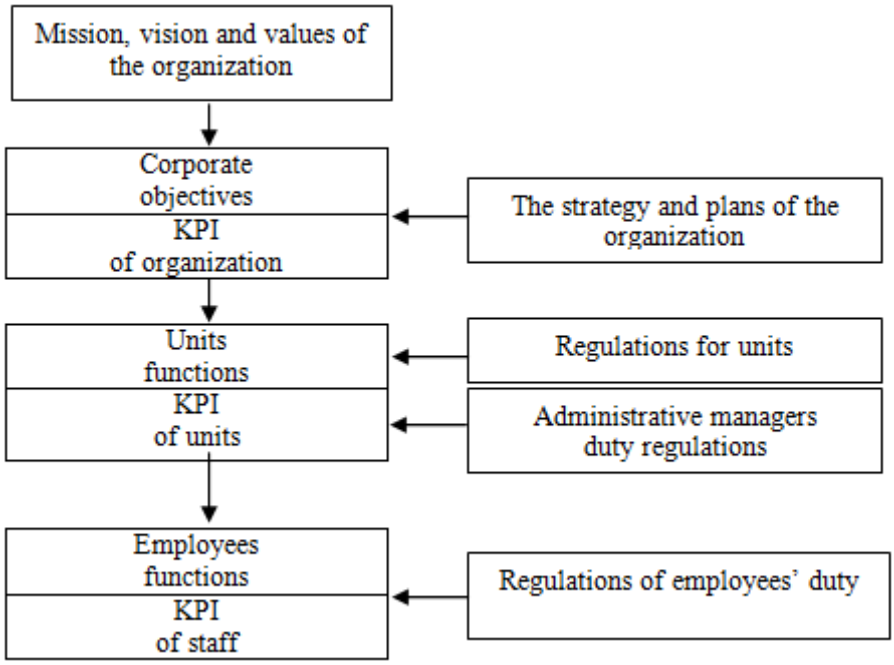

Fig.2. Functional KPI development approach

Developed for each position KPI at the end can be converged to a conditional integral indicator of overall result. This indicator should be considered as labour productivity indicator.

The value of public sector in social services in dealing with the problem of increasing the social labour productivity in the national economy lies primarily in its impact on labour productivity growth in the real sector of the economy; hence there is a need to implement competently the motivation and stimulation of state employees.

It should be said that the system of motivation and stimulation of all employees work mainly oriented towards material forms of encouragement, which satisfy only the primary needs of workers but the higher levels of needs stay unsatisfied. Generally, the main motivation method in organizations is increase in wages. The Minister of Labour and Social Protection of Russian Federation also believes that the salary is the main quality work motivation. In the world competitiveness ranking for 2014-2015 (The Global Competitiveness Index) Russia occupies 53rd place out of 143 countries. Our neighbors on wages are Philippines and Bulgaria.

The constant advance in wages, in our opinion, is not conducive for keeping the labour activity at the appropriate level and improving the labour productivity. This method may be useful to achieve short-term rises in productivity, because as a result, the certain type of adaptation to that kind of impact takes place.

Apparently, to avoid this adaption a variety of incentive pay systems are currently being tested, particularly, sophisticated ones in education field (L. Nadreeva, 2015). For example, one of the normative approaches in the formation of wages - when the salary of an employee or its' part determined by multiplying the price of point on the number of earned points.

This approach to the university teachers' labour assessment lays in the basis of so-called "Teachers portrait". The purpose of implementation of "Teachers portrait" in universities is providing the link between researchers and teachers wages with the results of their work. Teacher acquires a right to receive a premium (surcharge) by achievement of certain results, which are translated into points. The value of the result (amount of work) depends on position - higher position has higher requirements for the employee, and the greater number of points has to be earned for premium (surcharges). Thus, described salary system stimulates the intensification of teachers' work.

In order to achieve the better returns and quality of work of education sphere employees, it is necessary not to encourage the intensification of their work, as unfortunately happens today, but on the contrary, as noted above, unload workers, facilitate their work. The approach associated with the

maximum work load, leads to self-defense mechanisms triggering the work out of class reduction, attention decrease, increase in irritability, indifference to the students, patients comes out, emotional burnouts grow.

In our opinion, a strong non-monetary motivation takes place in creative activities, which can be attributed not only the culture and art, but also the work of academic staff (teachers, researchers), doctors and scientists.

To confirm this hypothesis, an analysis of the interrelation between average wage per one academic staff member and university activity indicators was held:

- Income from R&D per academic staff member, thousand rubles;
- The number of citations in the Scopus indexed system per 100 academic staff members, units;
- R&D volume per one academic staff member, thousand rubles;
- The number of license agreements, units.

112 universities of Volga Federal District were selected as study objects.

Results are included in table 1.

Table 1: Pair correlations of wages and income from R&D, the number of citations in Scopus, R&D volume per one academic staff member, the number of licenses

		Wages	Income from R&D	Citations (Scopus)	R&D per 1 REE	Licenses
Wages	Pearson Correlation	1	,635	,744*	,389	,498
	Sig. (2-tailed)		,066	,034	,300	,172
	N	109	109	108	109	109
Income from R&D	Pearson Correlation	,635	1	,611	,595	,544
	Sig. (2-tailed)	,066		,108	,091	,130
	N	109	109	108	109	109
Citations (Scopus)	Pearson Correlation	,744*	,611	1	,550	,898**
	Sig. (2-tailed)	,034	,108		,158	,002
	N	108	108	108	108	108
R&D per 1 REE	Pearson Correlation	,389	,595	,550	1	,358
	Sig. (2-tailed)	,300	,091	,158		,345
	N	109	109	108	109	109
Licenses	Pearson Correlation	,498	,544	,898**	,358	1
	Sig. (2-tailed)	,172	,130	,002	,345	
	N	109	109	108	109	109

*. Correlation is significant at the 0.05 level (2-tailed).

**. Correlation is significant at the 0.01 level (2-tailed).

The performed analysis allows establishing an interrelation between only two indicators - wages and income from R&D, and this relationship is reversed, that is absolutely logical – when income from R&D increase then wages rise accordingly.

For other factors the correlation dependence between wages and universities activity indicators - number of citations in Scopus, the volume of R&D and the number of licenses - is not revealed, which confirms the conjecture about existence a strong non-salary motivation in creative activities.

Thus, the incentive function of wages in higher education institutions is less relevant than, for example, in many professions that belong to manufacturing. There is the reproductive function come to the foreground: it is not necessary to try to connect as accurately as possible the wages with the immediate results or load fluctuations. It simply must be sufficient for the normal reproduction of worker, in the terminology of the International Labour Organization - dignified, i.e. providing the ability to meet the requirements necessary to maintain the normal state of complex workforce.

Strengthening the stimulative function of wages leads to the fact that:

- Significant part of total labour effort is used unproductively, i.e. not to perform the basic functions and duties (for the treatment, education, scientific problem solving, etc.) but to present their achievements and results of the work in the best way;
- One that redistributes their time fund from basic to representative functions benefits;
- There is an unhealthy competition, envy, deteriorating atmosphere in the team developed.

In creative activities the labour results (which is difficult to measure, as already mentioned) depend primarily on the level of employees professionalism – that what is need to be measured and stimulated by setting the quality grading, underlying the differentiation of wages levels guaranteed to employee providing fulfillment their duties in good faith. As a criterion of permit to work, guaranteeing an appropriate level of payment shall be the rigid conformance to professional standards.

It is necessary to use the other types of motivation, not only economic, for professional and personal growth. For instance, there is a need to consider the system of career advancement of teachers, who have very short career ladder with limited steps - it can only become a head teacher or principal, and these steps are available only for a small number of teachers. Therefore, it is appropriate to look for other options in order to motivate teachers for further career development. It can be offered to implement different statuses, such as teacher - methodologist, teacher - innovator, teacher - researcher. Teacher's activities would change with a new status and would be consistent with the development phase, which can be realized in several ways.

Summing up, some important points should be highlighted. Thus, in June 2014, the Russian Federation government approved a plan to improve labour productivity. The Central Bank of Russian Federation, Bank for Development, Federal Agency on Technical Regulating and Metrology, Russian Union of Industrialists and Entrepreneurs, etc. were considered to be involved to this work. However, the subgroup dealing with issues of improving productivity didn't meet even once during current year. According to the chairman of the Public Association of productivity improvement it is necessary to establish a special institute for program to be effective (V. Bovykin, 1997). Apparently, by analogy with experience of foreign countries. There is a European association of national centers of productivity in the West, which consist of 14 countries. Also, there is an Asian organization of labour productivity actively functioning in the East, with 20 countries as members.

Taking into account the fact that in 1990's all the institutions concerned with improving productivity were eliminated in Russia and that now there are just few qualified and experienced experts in improving productivity, the implementation of the idea of special institution will contribute to productivity growth in material production sphere and in the services sector.

Russian Ministry of Labour and social protection together with The Ministry of Education and Science of Russia, Agency for Strategic Initiatives and number of other organizations are realizing the project which is very interesting from the perspective of improving productivity point of view.

They prepared the reference book, which includes 1620 the most demanded professions and specialties. Identification of these professions and specialties carried out on the basis of the survey more than 13.3 thousand organizations. There were highlighted the requiring vocational secondary education. During the formation the top 50 specialties requiring vocational secondary education, the focus was not only on high-tech industries, but also on services. At the same time the requirements for the competence of competitions participants within the World Skills championships were taken into account. Importantly, the Ministry of Education and Science of the Russian Federation is going to implement the new effective forms and standards of workers training in professions (specialties) from the "top 50" list.

The main conclusions and recommendations

1. In terms of productivity measurement in public sector:

- as a strategic benchmark for public sector development it is better to choose the quality of work results and its effectiveness rather than productivity, not as the ratio of results and costs (efficiency) but as goal achievement level (effectiveness);
- there have to be convincing productivity measuring procedures, therefore we suggest to develop key performance indicators for each of the budget organizations for each position. KPI developed for each position should be kept in a conditional integral indicator of the overall result, which seems appropriate to consider as an indicator of labour productivity.

2. In terms of public sector employees labour motivation improvement:

- we analyzed the interrelation between average wage per one research and teaching employee and basic indicators of universities activity. Furthermore we substantiated the hypothesis of predominance in education sector the strong non-monetary motivation to work. It means that the salary does not need to be linked as accurately as possible with the short-term results. It simply must be sufficient for the normal reproduction of worker, i.e., provide the ability to meet the requirements necessary to maintain the normal state of complex labour. Taking into account the level of wages in the education sector at the moment, it is referred to the need to increase wages of the higher-education teaching personnel.

- we proved the necessity to establish a quality grading underlying the differentiation of salary levels, guaranteed to workers under condition of diligent performance of their duties. The criterion for admission to work, guaranteeing an appropriate level of payment, should be rigid compliance with professional standards;

- we suggest to change the system of teacher career development by introducing different statuses - teacher - methodologist, teacher - innovator, teacher - researcher. Activities of the teacher would change with a new status and would be consistent with the development phase of the teacher, which can be carried out in several ways.

3. In terms of development of recommendations to improve productivity in the service sector:

- to establish the special institutions oriented on the labour productivity improvement;
- to introduce new and effective forms of service workers training standards.

Creation of a modern system of workers training in service sector, using conclusive measurement procedures for productivity assessment, improving the motivation and stimulation system of service sector personnel allows us to look forward for positive changes in productivity of workers in this sector.

Study on Motivating the Involvement of the Companies in Romania, in Social Responsibility Actions

Andrei Radu Iova, Daniela Crețu and Mariana Burcea

-The University of Agronomic Sciences and Veterinary Medicine Bucharest, the Faculty of Management, Economic Engineering in Agriculture and Rural Development – Calarasi Branch, Country Romania, e-mail andrei_anglia@yahoo.com; danielacretu5@yahoo.com; burcea_mariana2003@yahoo.com

Abstract

The present analysis, aims at identifying the motivations which are the basis of the involvement of the companies in actions of social responsibility and the managers awareness on the effects of these activities among the employees and the community. As a research method the quantitative study was used, by means of the questionnaire, applied to the managers, at the company location, by the interviewers. In evaluating the data in the survey, the association test was used, (Chi, Hi or $\chi 2$, theoretical). This statistical indicator implies to verify the association hypothesis between the answers obtained from the questionnaire to the alternatives of a question and to verify a particular set of data which can follow a known statistical distribution.One of the major problems that concern the managers relates to the question whether it is fair to make known the actions of social responsibility. It results that one of the disadvantages of the social responsibility programs is that they are not interconnected with the specific of the business. The companies are not able to identify, to prioritize actions that have the greatest impact. Through this study, we consider that we contributed to the managers' awareness on the financial and moral effects resulting from the initiatives of social responsibility. It is time for a new corporate model, driven by a new type of leader, model in which the creation of a value in business also means creating value for the society. The initiatives of social responsibility are closely related to the level of managers' education and to the company seniority they manage.

Keywords: motivation, social responsibility, social impact.

Introduction

There are still many difficulties in adopting a responsible behaviour of the companies managers in Romania, who need to understand that the initiatives in the field of the social responsibility can turn into marketing strategies. The fact that the benefits generally occur only on long term, discourages many companies. Kotler, (2000) recommended in his book "If the organizations used in the actions of social responsibility the same principles that guide also the choices they make in business, they would find that the social responsibility will transform from cost or charitable action into a source of competitive advantage on the market".

On short term, these activities determine the cost of the company, but on long term the company has benefits, both financially and in terms of consumer confidence and strengthen a positive image among them. People are connected and make connections; they judge the companies not only for the quality of services or goods purchased or shares owned, but also in terms of footprint which they have in the community and how this has impact on their welfare.

Materials and methods

For the study elaboration, 2 types of methods were used: 1.Methods of data collecting: specialised literature review; getting information from administrative and secondary sources; individual interview; focus group; case study; on site survey. 2. The method of questionnaire for data collecting and interpreting. Depending on the type of questions – closed or open – each repondent was free to formulate answers and could choose

from a series of pre-defined statements. The questionnaire was elaborated by interview and was addressed directly to legal entities and natural persons, that were involved. In evaluating the data in the survey, the association test was used, (Chi, Hi or $\chi 2$, theoretical). This statistical indicator implies to verify the association hypothesis between the answers obtained from the questionnaire to the alternatives of a question and to verify a particular set of data which can follow a known statistical distribution. The test is applied to the issues in the social and economic area and is calculated after forming some contingency tables, where the data are clasified according to one, two or more segmentation variables, mentioned by Mihăiţă (2013) in his study.

This test allows to highlight the existence/non-existence of some association links between the sub-groups created by the studied segmentation variables.
As the test expression $\chi 2$ is obtained based on observations, it results that it is a statistical value and so it is not a parameter, that is why it is also named non-parametric statistical test or free distribution test, namely a test that does not depend on the form of the initial, basic law, mentioned by Mihăiţă (2013) in his study**.**

The stages are the following:
1. *Formulating the null hypothesis H0*, which states that the two variables-segmentation questions there is no cause or association link between : X – company seniority (up to 5 years, between 5 and 10 years, between 10 and 25 years, over 25 years) and Y – managers' education involved in social responsibility actions (high school, higher, post university education)
2. Choosing the meaning level of threshold α and calculating the number of freedom degrees of the table, according to the formula (r-1)*(c-1); (ex: (3-1)*((4-1) =6); based on these data, it is taken from distribution table $\chi 2$ its value, $\chi 2$ theoretical.
3.Calculating the expected theoretical frequencies (hoped for, in case of a homogeneity test). The calculations were carried out with Microsoft®EXCEL and are included in the superior part of table 1.

Table .1. Respondents' structure according to education and company seniority

Company seniority	UM	**Managers education**			Total	
		High school education	Higher education	Post univers education	No	%
Up to 5 years	nr	6	12	4		
Between 5 – 10 years	nr	8	10	11		20,10
Between 10 - 25 years	nr	12	24	8		8,79
Over 25 years	nr	13	19	4		9,05
Total	nr	39	65	27	131	100,00
	%	30	50	20	100,0	X
Indicators	Test $\chi 2$	Meaning threshold				
	≤	0,2	0,1	0,05	0,01	0,001
CHITEST (value Sig)	7.47E-02					
Freedom degree	6					
CHIINV (Chi theoretical)	≥	8,56	10,64	12,59	16,81	22,46

CHIINV (Chi calculated)	38,91					
Pearson Co-efficient	0,30					

Source: Processed according to data in the applid questionnaire

4. *Comparing the results obtained*, for which there are the following situations:
- if the null hypothesis is rejected and so there is an association or potential relation between the studied variables;
- if a null hypothesis is accepted and so there is no association or potential relation between the studied.
5. *Calculation of C contingency co-efficient*, has the role to measure the association degree between the variables of the contingency table, are included in the lower part of the table (Table 1).It is compared CHIINV (Chi calculated) respectively 38.91 with CHIINV (Chi theoretical) for different probability thresholds. Thus, it is find out that CHIINV (Chi calculated) of 38.91 is placed more over 22.46, which corresponds to a risk of 0.001, respectively, a probability of 99.99%. This means that the initiatives of social responsibility are closely related to the level of managers' education and to the company seniority they manage.

Pearson co-efficient, is calculated regardless of the nature of variables (continuous or discrete) and regardless of the nature of their distribution (normal or not), at the population subject to research, according to the mathematical model proposed by the statistician Karl Pearson. The closer the *C* value is to 1 (but it never reaches equal to 1), the more correlated the variables are. In our case it has the value of 0.30 and it is very significant ,Pascu as also mentioned in 2011.

Results and discussions

The spread of the concept of corporate social responsibility generated controversy on the ethics of their involvement in the community life, asa cum mentioneaza the speciality literature, seeing Catherine J.M (2006), Charter et all. (2002), Mohr (2009). Besides the economic considerations, managers must consider also the moral arguments in favour of the social responsibility actions. They, through the work they carry out, generate social problems, and therefore they have the responsibility to solve them and prevent the occurrence of new problems, namely: extinction of certain occupations and hence unemployment increase; labour migration; environmental pollution, exploitation of non-renewable resources, mentioned by Coors (2005) and Zadek (2000) in their studies**.**

The study regarding the social responsibility– pillar of the company strategy was conducted on a sample of 131 companies, with activity in the agriculture and food industry, operating in South Muntenia Development Region. The questionnaire consists of 11 questions, including: filter questions, knowledge of notion and of initiatives of social responsibility, the company's involvement in such initiatives, the main reasons for which the managers practice social responsibility, ways of involving the companies, causes that should be supported by the companies in the context of this concept, other aspects.

In the structure of the organizations subjet to the study (figure 1) it is remarked the fact that micro-enterprises predominate with a percent of 50, followed by the big and medium size enterprises with a percent of 48 and the state enterprises, with a percent of 2.

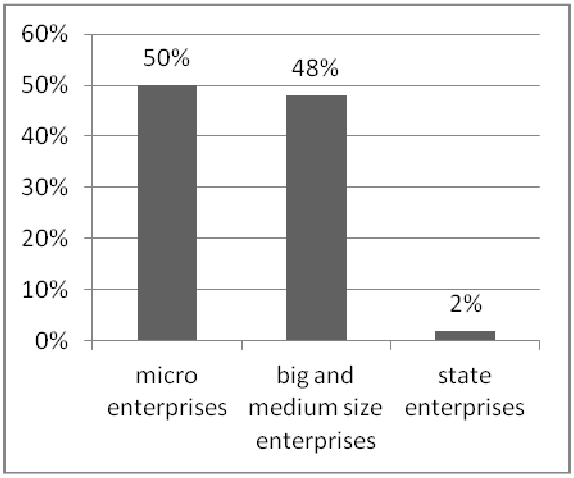

Figure 1. Structure of the economic agents in the studied sample

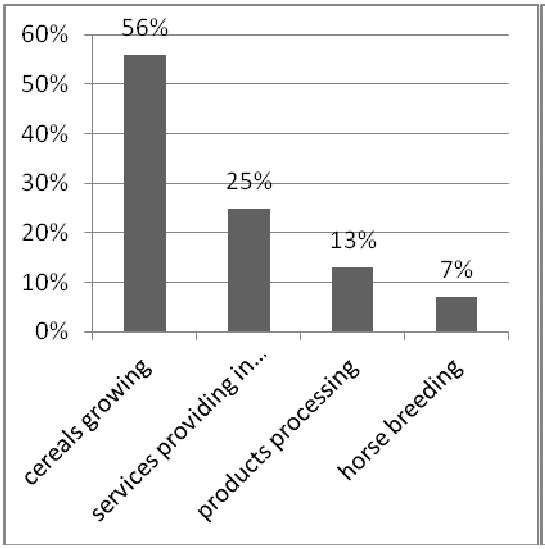
Regarding the activity sector, a percent of 56, has as activity - cereals growing; 25 percent – services providing in agriculture; 12.5 percent – meat and milk products processing; 6.5 percent, horse breeding (figure 2).

Because the interviewed persons are part of the superior management sample, the predominant level of their studies, is at the faculty level - percent of 50 (figure 3).



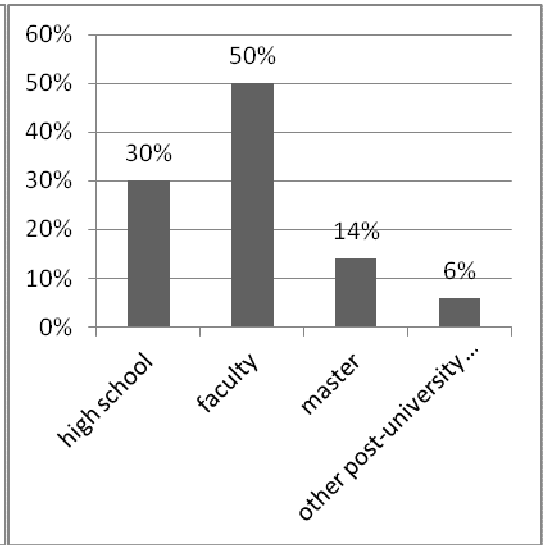


Figure 2. Activity sector of the economic agents **Figure 3. Level of the respondents studies**

The respondents age (figure 4), is contained between 18 and 65 years old. The share, on age categories, is represented by the segment 35- 59 years old, with a percent of 60. Persons with different positions and studies were interviewed, just to show an image closer to the reality of the conceptions regarding the perception on the concept of social responsibility (figure 5). The share is represented by the companies administrators, with a percent of 26, followed by the technical manager of the company, with a percent of 16, by the general manager, economic manager and other staff categories.

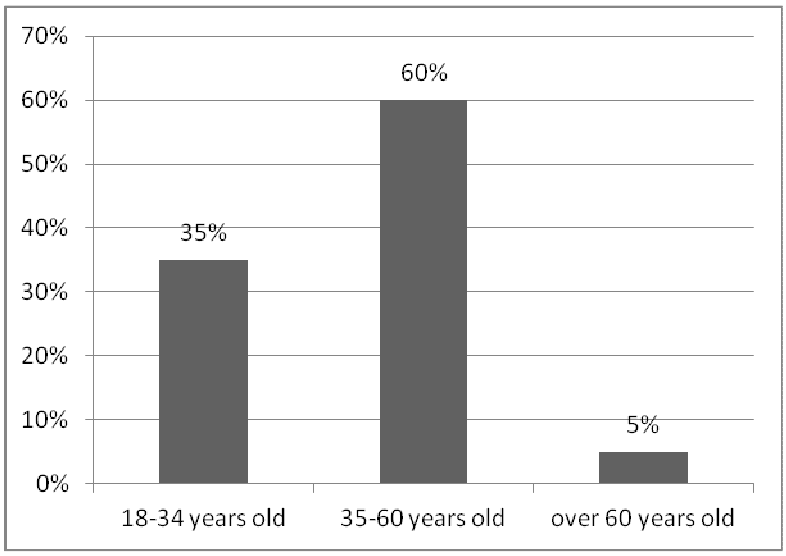

Figure 4. The respondents age

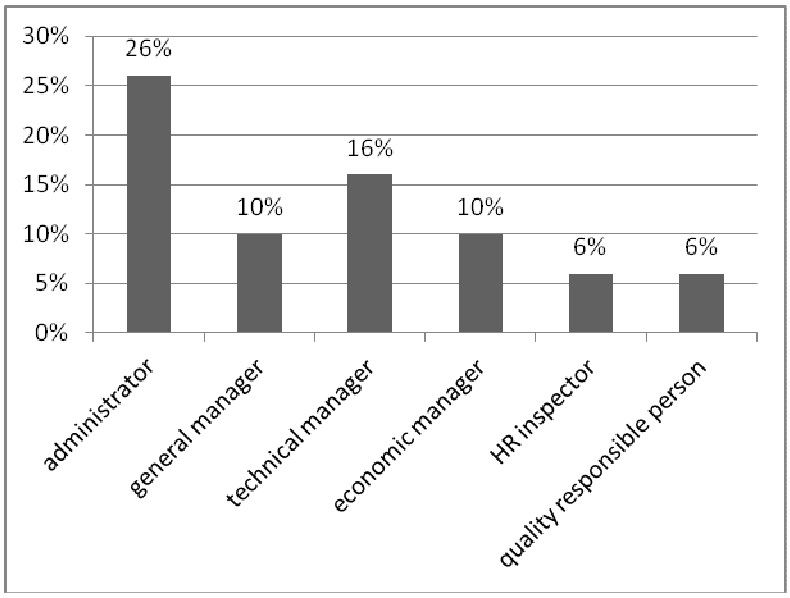

Figure 5. The respondention position within the company

At the question "Do you know the concept of social responsibility", 89 percent of the respondents said YES, and a percent of 11 said NO.

At the question "In your opinion, social responsibility must be practiced rather by ": a) companies; b) NGOs; c) state institution, a percent of 61.66 answered that this responsibility is rather to NGOs (figure 6).

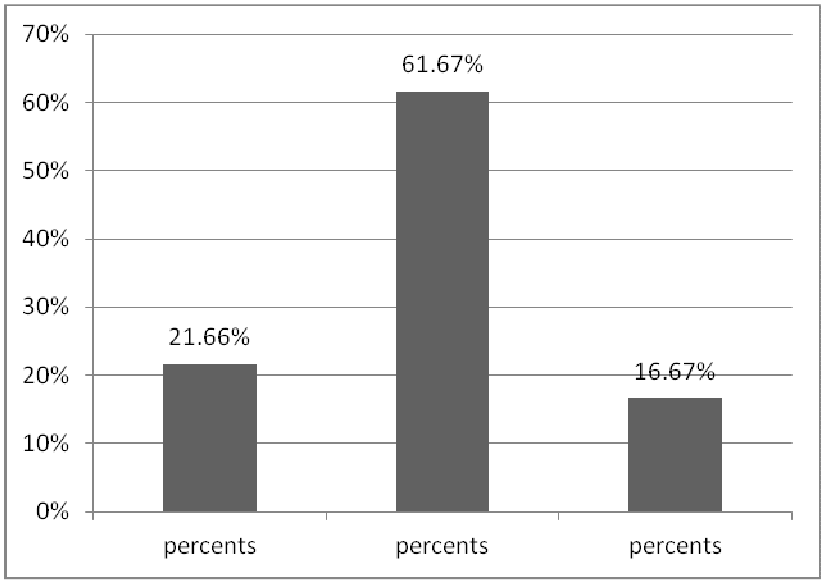

Figure 6. The structure of answers regarding the social responsibility

At the question "Were you involved in initiatives of social responsibility", 81 percent answered YES and 19 percent answered NO.

At the request: "Evaluate the modalities for which you develop actions of social responsibility, according to a scale from 1 to 5 (1= the least important motivation, 5= the most important motivation) depending on the importance you give to it", from the managers responses it resulted that they do not have a unique motivation for taking responsibility but rather, it is about a mix of reasons that lead them to do good deeds and motivations are as diverse as managers and management itself.

The result is that 21 percent do actions with social impact to compensate the pollution and the negative effects of its production, this response came especially from companies that have the object activity meat processing. Other managers, 11 percent, said it is a matter of pride and it shows the status acquired. There are managers, 29 percent which do not make a secret of the fact that they initiate actions of social responsibility due to tax facilities. Other managers, 9 percent feel a moral duty to customers and employees and they realize they would have not been there without the support of those who have bought the products and then, they feel compelled to return to the community some of the profit obtained under the form of projects with a positive impact. There are also managers, 23 percent initiating such actions due to the pressure exerted by NGOs. Last but not least, there are the managers who practice social responsibility for the undisguised need to increase profits (table 2).

Table 2.Evaluation affirmations

No.crt	**Affirmations**	**Evaluation**				
		1	2	3	4	5
1	Environment protection, in order to compensate pollution and the negative effects of their won productions	2%	6%	2%	30%	60%
2	It is a matter of pride and of showing the status obtained	4%	4%	20%	20%	52%

3	Fiscal facilities	6%	8%	4%	42%	40%
4	Pressure made by NGOs	6%	6%	10%	24%	54%
5	Promotion, in order to increase profit	2%	8%	12%	10%	70%
6	Pressure of clients and providers	80%	4%	4%	6%	6%

At the request: "Evaluate the following initiatives, according to a scale from 1 to 5 (1= the least important initiative, 5= the most important initiative) depending on the importance you give to it", among the managers initiatives of social responsibility, 21 percent considered as priority actions aimed at environment protection, 19 percent actions in favour of their employees, 9 percent those that support talents, 27 percent of those that support contests and other activities in the education sector, 14 percent supporting actions in health sector, 9 percent those that support people in situations of poverty and social exclusion (table 3).

Table 3.Evaluation affirmations

No crt	**Affirmations**	**Evaluation**				
		1	2	3	4	5
1	Environment protection	2%	6%	2%	30%	60%
2	Talents support	4%	4%	20%	40%	32%
3	Contests and other actions in educational sector	6%	8%	4%	42%	40%
4	Action for their own employees	6%	16%	14%	30%	34%
5	Actions in health sector	22%	16%	16%	20%	26%
6	Persons found in poverty situations and social exclusio	80%	4%	4%	6%	6%

At the question "Actions of social responsibility serve the interest of": a) employees; b) community; c) organization, a percent of 53.33 answered they serve the community interest and a percent of 31.66 answered that they serve the organization interest, to make known and to increase the sales. A percent of 15 answered that the actions serve the employees interest, who become proud of the organization they work with (figure 7).

At the question "Management in the organizations in Romania, implies the employees in drawing and developing actions of social responsibility": a) not at all; b) to a small extent; c) to a large extent, a percent of 38.33 answered that they are not involved at all and a percent of 25 answered that they are involved to a large extend, this answer resulting from the managers of the large companies, who have staff qualified in this kind of (figure 8).

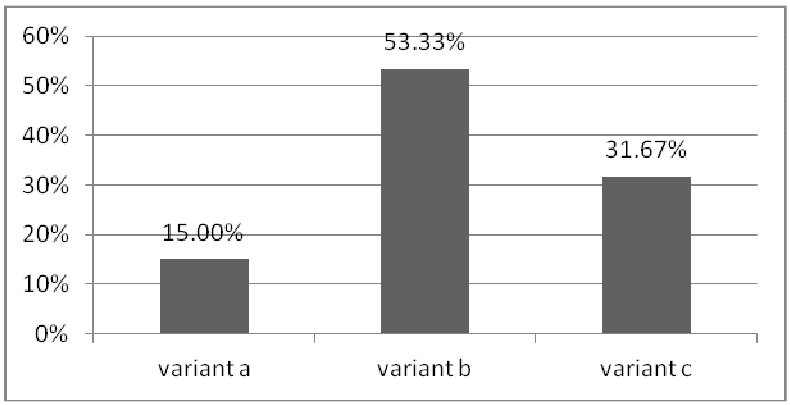

Figure 7. Answers quantification

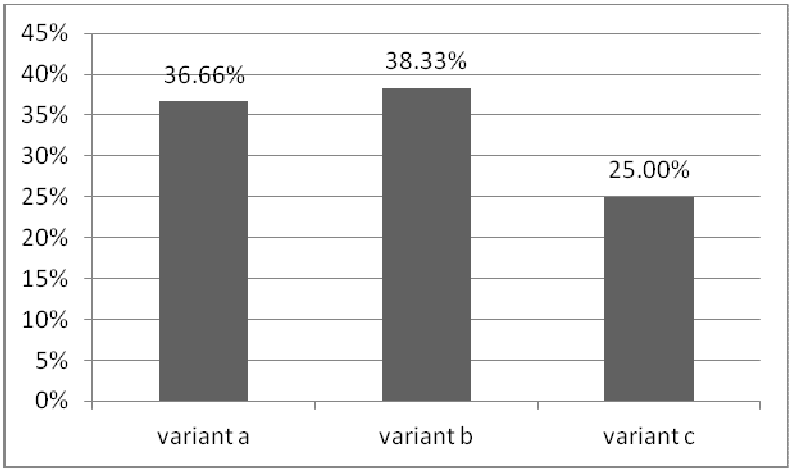

Figure 8. Answers quantification

At the request: "Make a hierarchy of the below factors, which could encourage the actions of social responsibility (1= the least important factor, 5= the most important factor) depending on the importance you give to it", a percent of 53 considers that the most important factor that could encourage the actions of social responsibility is represented by the fiscal facilities, followed by the priority access to financial resources (27 percent), promotion on the market (15 percent), better dissemination of information (3 percent) and only 2 percent, mentioned the factor "argument of ethics in business" and "programs of social responsibility certification" (table 4).

Table 4.Evaluation affirmations

No crt	Affirmations	Evaluation				
		1	2	3	4	5
1	Better dissemination of informatio	8%	16%	12%	30%	34%
2	Programs of social responsibility certification	4%	4%	20%	60%	12%
3	Fiscal facilities	6%	8%	4%	32%	52%
4	Priority access to financial resourc	6%	6%	10%	24%	54%
5	Promotion, organization visibility the market	12%	12%	16%	10%	50%

6	Arguments of ethics in business	80%	4%	4%	6%	6%

Conclusion

Although the managers' role is to manage the company's money, we must keep in mind that corporate social responsibility is a marketing tool that can bring profit. It is ethical that part of the company profit to return to the social group who participated, even indirectly, to achieve it.

A healthy society needs healthy companies and vice versa. No social program can rival the business sector when it is about creating jobs and improving living standards. Moreover, we must not underestimate the sense of involvement of employees of a company, who after such actions feel they are part of a major and impact action.

No business can solve all the problems of the society and cannot cover all the costs of such actions. Therefore, the companies must carefully select the specific problems that interfere with their activities, Archie B (1991) as mentioned in the study.

In the current socio-economic context, the old ways of doing business no longer work. The traditional leadership roles fail. It is the perfect time for a new corporate model, driven by a new type of leader, model in which the creation of a value in business also means creating value for the society beyond the present markets and products. The countless researches conducted over the past decade highlight the importance of responsible and sustainable corporate behaviour, because any action of a company reaches the community it operates, creating positive or negative effects. Therefore, social responsibility must become an important pillar in the company's strategy.

L'Impact de la Mise en Scène de l'Emotion Dans la Publicité Selon le Profil Psychologique des Récepteurs

Sonia Ktari Alioui, Assistante, Institut Supérieur de Langue de Nabeul, Tunisie, Membre du Laboratoire Entreprises et Recherche Marketing (ERMA), soniaktari@yahoo.fr

Mustapha Zghal, Professeur émérite, Faculté des Sciences Economique et de Gestion de Tunis, Tunisie, Mustapha-zghal@gnet.tn

Résumé :

Cette recherche s'intéresse à la mise en scène de l'émotion dans la publicité, ses effets et ses modes de fonctionnement. Une expérimentation fondée sur 256 entretiens, nous a permis de vérifier que l'émotion perçue pendant l'exposition publicitaire, pouvait jouer un rôle important dans la formation des réponses à l'égard de l'annonce et de la marque. Cependant, ce processus se réalise à condition que les consommateurs associent l'émotion perçue à la marque émettrice ou sa consommation. Par ailleurs, nous avons établie des différences d'efficacité entre les annonces magazines, selon la façon dont elles mettent en scène l'émotion. Nous étudions en particulier les aspects de l'intégration émotionnelle dans la publicité, à savoir la saillance de l'émotion montrée dans l'annonce, la présence d'information centrale sur la marque et la clarté du message publicitaire à propos des attributs hédonistes de la consommation. De façon intéressante, l'impact des caractéristiques de mise en scène de l'émotion est modéré par les variables individuelles des répondants, notamment leur besoin d'émotion, leur tolérance à l'ambiguité, leur besoin de structuration et leur besoin de cognition.

Mots clés : réactions émotionnelles, intégration émotionnelle, variables psychologiques, efficacité publicitaire.

Abstract:

This research focuses on the staging of emotion in advertising, its effects and functioning. An experiment based on 256 interviews supports the hypothesis that emotion perceived during ad exposure can play an important role in the formation of responses toward the ad and the brand, on the essential condition that it is associated to the announced brand or consumption experience. We also provide evidence of effectiveness differences between print advertisements based on how they stage the emotion. Various creations are observed according to the emotional integration in advertising, in particular the salience of depicted emotion, the presence of central information related to the brand and the explicitness of message about hedonic attributes of consumption. Interestingly, the impact of ad characteristics appears to be moderated by some individual variables, especially the need of emotion, the tolerance of ambiguity, the need of structure and the need of cognition.

Keywords: emotions reactions, emotional integration, psychological variables, advertising effectiveness.

Introduction

Au cours des années 80, les théoriciens du comportement du consommateur ont redécouvert le concept d'émotion, en s'opposant à l'approche cognitive qui avait dominé la recherche dans la décennie 70. En matière de communication, cette démarche s'est soldée par un intérêt croissant pour le rôle des émotions dans la publicité, et la prise en compte de l'émotion comme médiateur de persuasion publicitaire, parallèlement aux croyances (Lajante, 2015). La mise en cause des modèles de persuasion publicitaire à dominance cognitive constitue alors le point de départ du regain d'intérêt pour l'émotion en publicité. Les recherches publicitaires soulignent l'importance de l'émotion comme système indépendant de la cognition, et s'intéressent par conséquent à l'ensemble des "états affectifs" manifestés spontanément par les consommateurs en réponse à l'annonce. Différentes études (qui varient dans leurs résultats empiriques,

leurs méthodologies, et les stimuli publicitaires qu'elles emploient) ont contribué à montrer le rôle suffisant des réactions affectives spontanées pour expliquer l'efficacité publicitaire. (Batra et Ray, 1986 ; Derbaix et al, 2012 ; Aaker et al, 2008 ; Holbrook et al, 1991)

Mais en dépit du nombre important d'études relatives à cette thématique, L'étude du concept de réaction affective en publicité s'est caractérisée par des visions qualifiées le plus souvent de réductrices, concentrées sur un ou certains éléments au détriment d'autres (Bakalash et Riemer, 2013) d'où le constat de plusieurs zones d'ombre qui restent jusqu'à aujourd'hui non éclaircies. En effet, on remarque que face à une même publicité émotionnelle, les réponses individuelles peuvent varier considérablement d'un individu à un autre. De même une même personne peut être fortement touchée par une publicité émotionnelle et être totalement indifférente face à une autre publicité qui utilise le même registre émotionnel. La majorité des travaux ont cherché la réponse soit dans les caractéristiques intrinsèques des stimuli publicitaires (Becheur et al, 2009), soit dans les caractéristiques personnelles du récepteur (Dafonte-Gomez, 2014 ; Poncin, 2004). Notre recherche a essayé de pousser encore plus loin la réflexion, en combinant ses deux axes de recherche et en essayant de voir quelle mise en scène de l'émotion en publicité affecte le plus chaque profil du consommateur selon ses caractéristiques psychologiques.

Notre recherche veut montrer que la façon de mettre en scène l'émotion dans l'annonce a un impact sur la nature et l'intensité des réactions émotionnelles des récepteurs mais aussi sur les variables de l'efficacité publicitaire. Notre intérêt se porte plus particulièrement sur les caractéristiques de mise en scène de l'émotion qui donneraient une opportunité plus ou moins grande aux consommateurs de détecter des stimuli émotionnels dans l'annonce mais surtout d'utiliser l'émotion ainsi perçus dans la construction de leur attitude envers l'annonce et la marque mais aussi leur intention d'achat en associant l'émotion ainsi perçue à la marque. (Kemp et al, 2013)

On s'est intéressé plus particulièrement à la variable intégration émotionnelle qui est définie comme une caractéristique particulière de la mise en scène de l'émotion dans la publicité. Elle désigne les publicités dans lesquelles un ou plusieurs personnages expriment des émotions, ces émotions étant dues à la consommation du produit sponsorisé par la publicité (MacInnis et Stayman, 1993). On va étudier les trois notions qui relèvent de l'aspect intégré et/ou ambigu de la mise en scène de l'émotion dans l'annonce (Esparcieux, 1995), à savoir la saillance de l'émotion montrée dans l'annonce, la présence d'information visuelle sur les produits de la marque et la clarté du rôle de l'émotion dans le message publicitaire et leurs impacts sur les variables de l'efficacité publicitaire.

Nous tentons également de montrer que les récepteurs ne réagissent pas tous de la même manière face à une publicité émotionnelle et que cela dépend grandement de leurs profils psychologiques. Pour se faire nous allons étudier l'impact des variables psychologiques des récepteurs, à savoir leur besoin d'émotion, leur besoin de structuration, leur besoin de cognition et leur tolérance à l'ambiguité, sur le processus déclenché par un stimulus publicitaire émotionnel.

Cadre Conceptuel et Hypotheses

1. Les variables indépendantes, les caractéristiques de la mise en scène de l'émotion dans l'annonce :

Les études antérieures (Allen et Padgette, 1997) ont montré que la façon de mettre en scène (ou décrire visuellement) l'émotion dans l'annonce a un impact sur le mode de traitement émotionnel de la publicité. Notre intérêt se porte plus particulièrement sur les caractéristiques de mise en scène de l'émotion qui donnent une opportunité plus ou moins grande aux consommateurs : de "détecter" des stimuli affectifs dans l'annonce ; d'utiliser l'émotion ainsi perçue dans les raisonnements intellectuels au sujet du contenu publicitaire. Deux concepts paraissent intéressants à considérer dans ce but : l'aspect intégré de l'annonce et son aspect ambigu. (Olson et Reynolds, 1983)

La variable intégration émotionnelle est définie comme une caractéristique particulière de la mise en scène de l'émotion dans la publicité. Elle désigne les publicités dans lesquelles un ou plusieurs personnages

expriment des émotions, ces émotions étant dues à la consommation du produit sponsorisé par la publicité. Il ne s'agit plus d'étudier la réaction émotionnelle du consommateur pendant l'exposition publicitaire, mais plutôt la façon dont le consommateur peut percevoir une réaction émotionnelle chez les personnages dans la publicité, et peut traiter cette réaction émotionnelle comme une information portant sur l'expérience de consommation du produit. (MacInnis et Kamp, 1995)

Premièrement, l'annonce possède un aspect intégré lorsque le contenu publicitaire est organisé autour d'un ou plusieurs thèmes principaux. Cette disposition vise à faciliter la compréhension du message publicitaire, mais également à mettre en avant les aspects les plus importants dans la communication. L'émotion peut faire partie des thèmes mis en exergue par la publicité, ce qui doit faciliter sa prise en compte par les consommateurs lors du traitement de l'information publicitaire. (Evrad et Aurier 1996 ; Holbrook et al. 1984 ; Holbrook et Hirschman, 1982).

L'aspect intégré d'un stimulus augmente généralement sous l'effet de trois caractéristiques : (Streufert et Schroder, 1965)

(a) Le caractère saillant (c'est-à-dire apparent, évident) des informations relatives aux thèmes centraux.
(b) Le caractère confirmatoire (redondance entre les éléments d'information qui se confirment les uns les autres). (Karlins et Lamm, 1967)
(c) L'aspect structuré, de telle sorte que toutes les informations communiquées sont rattachées et expliquées par rapport aux thèmes principaux, et hiérarchisées en fonction de leur degré d'importance par rapport à ces thèmes. (Neimeyer et al, 1983)

Deuxièmement, l'annonce possède un aspect ambigu lorsque le message publicitaire est libellé de manière équivoque plutôt que de manière claire (Sieber et Lanzetta, 1964). En choisissant l'ambiguité, l'annonceur évite d'imposer "trop" directement ses arguments aux consommateurs. Il les laisse faire preuve d'"imagination" ou d'"abstraction". Ainsi une émotion peut être montrée dans l'annonce (par exemple une émotion vécue par un personnage), sans que son rôle (notamment son rôle par rapport à la consommation de la marque) ne soit clairement défini. Ce type de communication incite les consommateurs à donner eux-mêmes un sens à l'émotion montrée dans la publicité. Un message est plus généralement considéré comme ambigu lorsque qu'il est équivoque (admet des sens ou interprétations multiples), fragmenté, incomplet, ou incertain (s'exprime comme une fonction de probabilité quant à sa signification et ses implications). (Norton, 1975)

Dans une étude sur le rôle du produit dans la publicité, MacInnis et Stayman (1993) ont défini et mesuré le concept d'intégration émotionnelle, qui est définie par "la mesure dans laquelle l'utilisation, la non-utilisation ou l'utilisation abusive ou mauvaise du produit est décrite comme une cause des émotions ressenties par les personnages humains, animaux ou dessinés, dans la publicité" (Espacieux, 1995). MacInnis et Stayman (1993) puis MacInnis et Kamp (1995) distinguent les annonces dans lesquelles la marque est clairement montrée comme la cause de l'émotion de l'utilisateur (annonces à forte "intégration émotionnelle"), et celles dans lesquelles le lien entre l'émotion de l'utilisateur et la marque n'est pas clairement établi (annonces à faible "intégration émotionnelle").

Dans le cadre d'une communication qui montre de l'émotion, l'information sur le produit est critique, car elle permet de montrer l'existence d'un lien entre l'émotion décrite dans l'annonce et la consommation de la marque (Braun, 1999). A cet effet, le produit doit occuper une place centrale dans la publicité pour que celle-ci soit efficace. Pour prendre en compte la question du degré de centralité du produit dans le contenu publicitaire, MacInnis et Stayman (1993) définissent un concept d'***intégration focale***, ce dernier désigne "la mesure dans laquelle le publicitaire assigne au produit un rôle de premier plan dans l'action, l'argumentaire, ou la présentation publicitaire" (forte intégration focale), ou au contraire un "un rôle d'arrière-plan, d'élément contextuel" (faible intégration focale). Cette définition se fonde sur les rôles joués par le produit dans la vie des consommateurs établis par Holman (1986), dont la publicité fait l'écho.

Holman (1986) a décliné les rôles que le produit peut jouer dans la vie des consommateurs. Il accorde

au produit un degré de centralité d'autant plus élevé que la possession du produit est un moyen pour l'individu d'exprimer sa personnalité, ou qu'il développe à l'égard du produit une relation exclusive. Il est à signaler que le produit est central lorsqu'il entretient un lien étroit avec le "soi" du consommateur.

Le concept d'intégration focale tel qu'il est défini comporte plusieurs limites : Premièrement, le produit (ou une partie du produit) peut être occulté du visuel publicitaire, et pourtant son absence ne fait que souligner l'importance de ce dernier dans la compréhension du message. Deuxièmement, la centralité du produit définie sur la base des rôles de Holman (1986) s'applique seulement à des publicités, où une tranche de vie de l'utilisateur est représentée (et dans laquelle le produit joue un rôle). A la place des effets de l'intégration focale, il est préférable d'étudier les effets de la présence (plutôt que l'absence) d'information visuelle sur les produits de la marque dans l'annonce. Celle-ci a des répercussions importantes sur le traitement de l'annonce, en particulier sur la mise en relation de l'émotion vécue ou perçue dans l'annonce avec la marque. (Braun, 1999)

En troisième lieu, on considère le problème de ***clarté du rôle de l'émotion dans le message publicitaire***. Cette notion permet d'observer les effets des annonces qui utilisent clairement l'émotion comme un argument publicitaire, contre celles qui suggèrent (mais sans le clarifier) un rôle pour l'émotion dans le contenu publicitaire. La clarté du message peut venir de son contenu univoque (ou sans ambiguité). Elle peut également venir de son contenu intégré, lorsque la présence des différents éléments d'informations publicitaires s'explique par un thème commun (ainsi le fait de montrer de l'émotion est justifié par une idée que l'annonceur veut faire passer et qu'il met par ailleurs en évidence). (Esparcieux et Ben Miled, 1997)

Une information est claire lorsqu'il n'a y a pas d'équivoque concernant son contenu ou sa signification. A l'évidence, il n'existe pas de clarté absolue de l'information, mais seulement des niveaux de clarté plus ou moins importants selon la façon dont l'information est communiquée. Le concept de clarté est intéressant, dès lors que le manque de clarté d'un message renforce sa complexité, et laisse place à l'abstraction, à la créativité des individus pour compléter l'information. Il a donc des répercussions sur l'élaboration des consommateurs face à l'annonce. (Sawyer et Howard, 1991)

MacInnis et Stayman (1993) et MacInnis et Kamp (1995) ont montré que les annonces à forte intégration émotionnelle génèrent des réactions émotionnelles plus fortes et sont généralement plus efficace que les annonce à faible intégration émotionnelle, bien que MacInnis et Stayman (1993) n'obtiennent pas de différences significatives d'attitude à l'égard de la marque face à ces stimuli, lorsque l'émotion montrée dans l'annonce est positive. Le fait que l'information publicitaire soit focalisée (ou centrée) sur la marque semble être une condition importante pour que les consommateurs construisent une représentation favorable de cette dernière (Baumgartner, Sujan et Bettman, 1979). Néanmoins, les résultats que l'on tire de cette étude empirique sont relativement limités, dès lors que l'intégration émotionnelle n'a pas été manipulée expérimentalement mais simplement mesurée, de même que la tonalité des publicités.

Nous allons entreprendre, dans le cadre de cette recherche, une étude des mécanismes de persuasion de la publicité sous des conditions d'intégration émotionnelle forte versus faible (Esparcieux, 1995). Il s'agit d'investir le rôle de l'intégration émotionnelle dans la persuasion publicitaire, et de le distinguer du rôle des sentiments personnellement ressentis par le consommateur pendant la publicité. Par rapport à l'analyse de MacInnis et Stayman (1993), on cherche à formaliser les liens entre l'intégration émotionnelle et les variables de persuasion : émotions ressenties pendant l'exposition, attitudes à l'égard de la publicité et du produit et intention d'achat. On propose alors de confirmer cette même relation dans un contexte tunisien à travers des publicités magazines sur un même parfum.

Au final, nous supposons que les publicités qui possèdent un aspect intégré engendrent des émotions positives plus fortes et seraient donc plus efficaces que les publicités qui possèdent un aspect ambigu.

2. Les variables psychologiques individuelles :

Les effets d'interaction entre l'affectif et le cognitif ouvrent des possibilités de segmentation des cibles de communication, et ce à partir du croisement des besoins de cognition (fort/faible) et d'affection (fort/faible) des consommateurs. Sojka et Giese (1997) définissent quatre profils de répondants: (1) les "penseurs" traitent l'information de manière rationnelle, et se fient par conséquent aux informations objectives; (2) les "sentimentaux" jugent un objet sur la base des sentiments qu'il évoque ; (3) les "combinateurs" sont sensibles à la fois aux arguments affectifs et cognitifs, de telle sorte qu'une communication qui combine ces deux types d'informations est plus persuasive qu'une communication qui s'appuie sur une seule dimension ; (4) les "passifs" sont des individus non impliqués (indifférents), que les modes de persuasion affectif et cognitif ne parviennent pas à convaincre. Il y a lieu de retenir dans cette recherche quatre types de caractéristiques individuelles modératrices des réponses affectives des récepteurs face à une annonce publicitaire : le besoin d'émotion, le besoin de cognition, la tolérance à l'ambiguité et le besoin de structuration. (Vanhamme et Chumpitaz Caceres, 2003)

Les styles cognitifs sont définis comme des "tendances individuelles stables. Ils s'expriment dans la manière dont les individus abordent et traitent l'information qui leur parvient" (Sternberg et Grigorenko, 1997). Dans l'étude actuelle, il est envisagé, précisément, un style cognitif lié au traitement de l'information ambiguë : ***la tolérance à l'ambiguité***, ou la tendance à ne pas être troublé par une situation ou un stimulus ambigue et à le considérer comme étant plus désirable, ils sont donc attirés par ce type de stimulus (Budner, 1962). Celle-ci permet de comprendre comment les consommateurs peuvent réagir aux annonces qui mettent en scène l'émotion de manière plus ou moins saillante, qui fournissent un message explicite ou implicite à propos du rôle de l'émotion dans la consommation de la marque, ou omettent de donner une information importante à propos des produits.

Par ailleurs, il est à considérer deux besoins de rationalisation de l'information complexe ou problématique : ***le besoin de cognition***, ou tendance à s'engager, par plaisir, dans un processus de raisonnement poussé (Cacioppo et Petty, 1982); ***le besoin individuel de structure***, ou la tendance à produire des raisonnements simplifiés pour sortir d'une situation problématique (Neuberg et Newsom, 1993). Il est à noter que les besoins de rationalisation de l'information sont en partie instables, car ils subissent des variations intra-individuelles ou contextuelles : au cours de sa vie ou selon les situations rencontrées, un individu peut se positionner différemment sur un même besoin de rationalisation. (Cacioppo et Crites, 1996)

Le besoin d'émotion désigne la tendance des individus à utiliser l'émotion dans leurs rapports avec le monde. Par rapport aux autres caractéristiques individuelles liées à l'émotion, ce concept présente l'avantage d'être le plus englobant car il traite à la fois (Raman, Chattopadhyay et Hoyer, 1995) : (a) du rôle de motivation de l'émotion (le besoin d'émotion oriente les préférences et décisions des individus par rapport à des situations/objets qui contiennent de l'émotion) ; (b) de son rôle d'état affectif subjectif (le besoin d'émotion détermine la volonté de manifester des réactions affectives plus ou moins intenses face aux événements) ; (c) et de son rôle d'information (le besoin d'émotion intervient dans la perception et l'évaluation des événements sous un angle émotionnel). Le besoin d'émotion présente donc un double intérêt pour cette étude : il influence à la fois les réactions affectives spontanées des consommateurs face aux annonces qui mettent en scène de l'émotion, et la prise en compte de l'émotion le long du processus de traitement de l'information publicitaire.(Safraoui, 2008 ; Kidwell, Hardesty et Childers, 2008)

Nous considérons le style cognitif de tolérance à l'ambiguité, les besoins de rationalisation, et le besoin d'émotion comme étant indépendants. Ainsi, l'intolérance à l'ambiguité peut engendrer une tendance à rationaliser l'information et ce, pour résoudre l'incertitude rencontrée : celle-ci peut s'exprimer par des stratégies de simplification de l'information (qui découle d'un fort besoin de structure), ou par des stratégies d'élaboration cognitive et ce, pour contrôler l'incertitude (qui découle d'un fort besoin de cognition) (Vannoy, 1965). Cependant, l'intolérance (plutôt que la tolérance) à l'ambiguité inclut deux autres composantes sans rapport avec les stratégies de traitement de l'information : (1) une tendance à vivre l'incertitude de manière négative (plutôt que positive) sur un plan émotionnel (Budner, 1962) ; (2) une fermeture (plutôt qu'une ouverture) d'esprit. (Rydell et Rosen, 1966)

Il est à constater que les individus qui ont une faible tendance à la simplification (besoin de structure)

peuvent avoir une forte tendance à l'élaboration (besoin de cognition) et inversement. Néanmoins, cette opposition n'est pas systématique : les individus peuvent choisir une troisième tendance, qui est l'évitement de l'information (c'est-à-dire ne pas la traiter), auquel cas, leur besoin de structure est faible, ainsi que leur besoin de cognition. Il est à noter que Neuberg et Newsom (1993), obtiennent empiriquement des résultats qui montrent que les besoins de structuration et de cognition sont partiellement (et inversement) corrélés. Il a lieu de remarquer qu'il n'existe pas d'opposition entre le besoin d'émotion et le besoin de cognition, mais plutôt une possibilité de combinaison de ces éléments. (Raman, Chattopadhyay et Hoyer, 1995)

Pour résumer, la définition de la tolérance à l'ambiguité est la tendance des individus à ne pas être troublé par un stimulus ambigu, à le considérer comme étant plus désirable et ils sont donc attirés par ce type de stimulus. Cette variable est mesurée dans le cadre de cette étude grâce à l'échelle d'Espacieux (1995). A ce titre, nous supposons que la tolérance à l'ambiguïté du récepteur agit sur le lien intégration émotionnelle et réaction émotionnelle du récepteur mais aussi sur le lien réaction émotionnelle du récepteur et efficacité publicitaire.

Le besoin d'émotion est aussi définit comme la tendance à apprécier des situations émotionnelles, des stimuli émotionnels, et la tendance à préférer l'utilisation d'émotion dans les différentes communications avec les autres. Cette variable est mesurée dans le cadre de cette recherche grâce à l'échelle de Raman et al (1995). Le besoin d'émotion influence à la fois les réactions émotionnelles spontanées des consommateurs face aux annonces émotionnelles, mais aussi la prise en compte de l'émotion tout au long du processus de traitement de l'information publicitaire (Poncin, 2004). Par conséquent, le besoin d'émotion est supposé agir sur le lien intégration émotionnelle et réaction émotionnelle du récepteur mais aussi sur le lien réaction émotionnelle du récepteur et efficacité publicitaire.

En ce qui concerne le besoin de rationalisation, on va étudier deux types de relations, ceux qui sont rattachées au besoin de structuration et ceux qui sont rattachées au besoin de cognition. Le besoin de structuration est la tendance à produire des raisonnements simplifiés pour se sortir d'une situation problématique. Cette variable est mesurée dans le cadre de cette recherche grâce à l'échelle PNS par Neuberg et Newsom (1993). Les recherches ont montré que face à des annonces désintégrées, les individus qui possèdent un fort besoin de structuration devraient ressentir des émotions plus intenses envers l'annonce que les individus à faible besoin de structuration. (Batra et Stephens, 1994). Nous supposons alors que le besoin de structuration du récepteur agit sur le lien intégration émotionnelle et réaction émotionnelle du récepteur mais aussi sur le lien réaction émotionnelle du récepteur et efficacité publicitaire.

Le besoin de cognition se réfère quant à lui à une tendance et à un plaisir intrinsèque à s'engager dans un traitement de l'information qui demande des efforts (Baumgardner, 1993). Les recherches ont montré que les individus qui ont un besoin de cognition élevé, procèdent à un traitement systématique des arguments du message, et que les individus à faible besoin de cognition s'engagent dans des traitements peu élaborés et préfèrent les éléments périphériques et holistiques de la communication (Ferraz De Souza, 2006). Par conséquent, le besoin de cognition est supposé agir sur le lien intégration émotionnelle et réaction émotionnelle du récepteur mais aussi sur le lien réaction émotionnelle du récepteur et efficacité publicitaire.

L'ensemble des relations que nous venons d'expliciter, est repris au niveau du modèle que nous proposons de testé dans le cadre de cette recherche. (Figure 1).

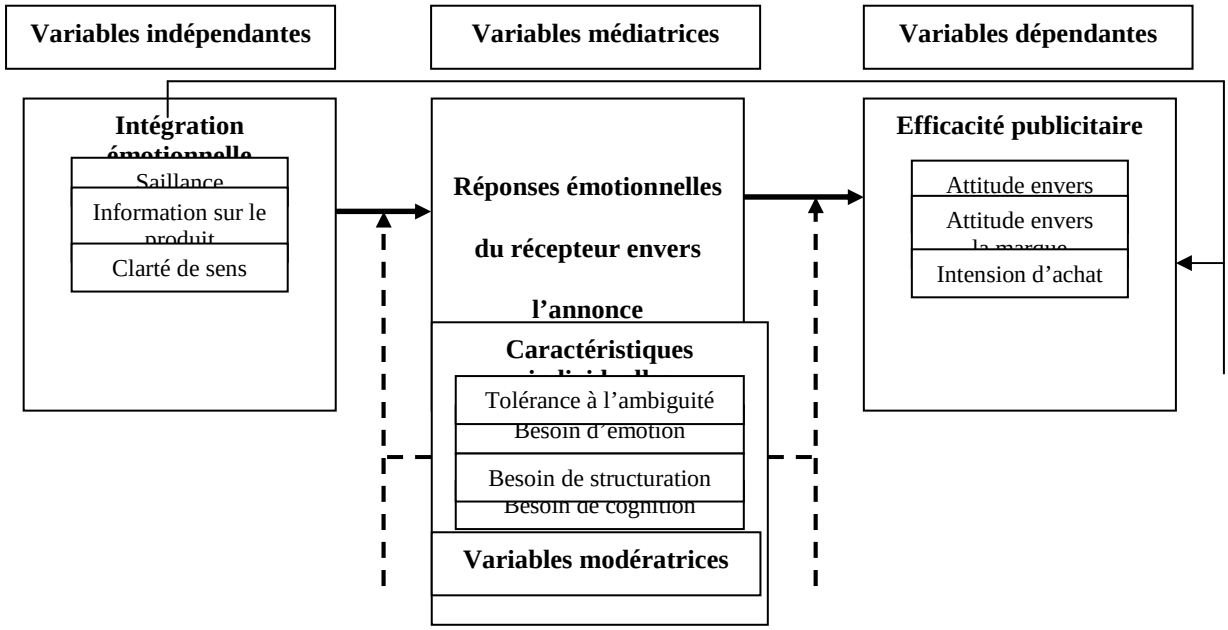

Figure 1 : Modèle conceptuel de la recherche

Methodologie

Avant de présenter les résultats, nous exposons ci-après les stimuli utilisés, les échelles de mesure, ainsi que les tests préliminaires relatifs à la validation des mesures et la vérification des manipulations.

Les Stimuli

En combinant les trois caractéristiques de la variable Intégration Emotionnelle, à savoir, la saillance de l'émotion, la présence d'information centrale sur le produit et la clarté du rôle de l'émotion dans le message, nous avons obtenu cinq catégories d'annonces comme l'illustre le tableau suivant :

Tableau 1 : Le contenu visuel des publicités testées et ses conséquences sur la façon dont l'émotion est montrée dans l'annonce

	Saillance forte		***Saillance forte***
Présence ou absence d'information central	**Absence de personnage d l'annonce**	**Représentation d'un personnage (utilisateur) train de consommer le pr**	**Représentation d'un personnage (utilisateu potentiel) qui ne consom pas le produit**
Présence du packshot d produit dans l'annonc	**(1)** L'annonce montre q l'émotion positive fait parti qualités intrinsèques du pr (ou du contexte de consommation)	**(2)** L'annonce montre clairement les conséquen hédonistes de la consomma du produit par l'utilisate	**(3)** L'annonce montre l'ém positive de l'utilisateur pote du produit, le produit lui-m mais ne décrit pas de lien e ces éléments

Absence de représentati visuelle du produit dar l'annonce	**(5)** L'émotion vient d'un c ou d'un contexte congruent le produit ou sa consomma mais le produit lui-même r pas montré		**(4)** L'annonce montre l'ém positive ressentie par u personnage (qui peut faire f d'utilisateur du produit

Clarté forte ***Clarté faible***

Trois experts ont été mis à contribution, dont deux enseignants en marketing et un créatif publicitaire, afin de sélectionner les publicités à tester à partir de 211 publicités magazines pré-sélectionnées. La majorité des jugements s'est effectuée au cours d'un seul et même entretien individuel de plusieurs heures. Un guide fourni aux trois juges a permis de clarifier le travail de classification qui leur était demandé. Notre méthode de classification des publicités s'est inspirée du système de caractérisation des annonces émotionnelles proposé par De Pelsmacker et Geuens (1997).

Dans un premier temps, la tâche des experts a consisté à différencier les annonces en fonction de leur contenu visuel. Les juges ont dû classer les publicités étape par étape en fonction des trois critères de l'intégration émotionnelles. Dans un deuxième temps, les experts évaluent le contenu émotionnel des publicités. Ils doivent d'abord déceler si l'annonceur a voulu mettre (ou non) de l'émotion dans l'image publicitaire. Puis ils doivent caractériser les images dans lesquelles l'annonceur a souhaité mettre de l'émotion, en spécifiant leur valence et leur intensité.

La difficulté réside dans la sélection des annonces, dans le fait de choisir pour le maximum de catégories d'annonces définies grâce aux choix d'opérationnalisation, des caractéristiques de mise en scène de l'émotion. Le choix final s'est arrêté sur cinq versions de la publicité d'un même parfum : (Annexe)

(1) La publicité utilisée dans la condition expérimentale n°1 est une publicité à forte intégration émotionnelle. Cette publicité est caractérisée par la présence d'information visuelle du produit (présence du packshot du parfum), par une forte saillance de l'émotion (présence d'une actrice qui exprime des émotions positives) et par une forte clarté du message (l'actrice est clairement montrée en train de vivre de l'émotion positive pendant l'utilisation du parfum).

(2) La publicité utilisée dans la condition expérimentale n°2 est une publicité à moyenne intégration émotionnelle. Cette publicité est caractérisée par la présence d'information visuelle sur le produit, par une forte saillance de l'émotion mais par un manque de clarté du message (l'annonce ne fait que suggérer l'existence d'un lien entre l'émotion positive de l'actrice et l'utilisation du parfum puisqu'il n'y a aucun contact physique entre les deux).

(3) La publicité utilisée dans la condition expérimentale n°3 : est une publicité à faible intégration émotionnelle. Cette publicité est caractérisée par l'absence d'information visuelle sur le parfum (absence du packshot du parfum), par une forte saillance de l'émotion mais par un manque de clarté du message.

(4) La publicité utilisée dans la condition expérimentale n°4 : est une publicité à faible intégration émotionnelle. Cette publicité est caractérisée par la présence d'information visuelle du parfum, par une faible saillance de l'émotion (absence de la femme qui exprime des émotions positives) et par un manque clarté du message.

(5) La publicité utilisée dans la condition expérimentale n°5 : est une publicité ambigue sans aucune intégration émotionnelle. Dans cette publicité, l'émotion vient d'un objet ou d'un contexte congruent avec le produit. A savoir, une main qui tient une boule de lumière qui suggère le parfum sans le montrer. Cette publicité est donc caractérisée par l'absence d'information visuelle du parfum, par une faible saillance de l'émotion et par un manque de clarté du message.

Mesures :

Pour tous les items de mesure, nous avons choisi d'utiliser des échelles de type Likert en 5 points (1 : Pas du tout d'accord, 2 : Plutôt pas d'accord, 3 : Ni d'accord ni pas d'accord, 4 : Plutôt d'accord et 5 : Tout à fait d'accord). Pour mesurer les réactions émotionnelles des récepteurs lors du visionnage des publicités, nous avons utilisé l'échelle de De Barnier (2002) qui est une traduction et une adaptation de l'échelle de Richin (1997), le Consumption Emotion Set (CES) et qui se compose 43 items. L'attitude envers l'annonce des récepteurs a été mesurée par l'échelle de De Barnier (2002) qui est composée de 6 items et qui a été inspirée de l'échelle Machleit et Wilson (1988). L'attitude envers la marque a été mesurée par l'échelle de De Barnier (2002) qui comporte 3 items et qui a été inspirée par l'échelle d'Edell, Goodstein et Moore (1990). Nous avons évalué l'intention d'achat des répondants par l'échelle d'Esparcieux (1995) qui se compose de 4 items. Le besoin d'émotion des répondants a été mesuré par l'échelle développée par Raman, Chattopadhyay et Hoyer (1995) et traduite par Safraoui en 2008 (6 items). Le besoin de cognition des répondant été évalué grâce à l'échelle de Cacioppo, Petty et Kao (1984), traduite et testée en 2005 par D'Astous et Deschênes (6 items). L'échelle PNS (Personal Need for Cognition) de Neuberg et Newsom (1993) traduite en français par Espacieux en 1995 (6 items), nous a permis d'évaluer le besoin de structuration des répondants. Pour finir, la tolérance à l'ambiguité a été mesurée par l'échelle de Budner (1962), traduite en français par Ben Miled (1992) (9 items).

L'échantillon

Un échantillon de convenance constitué de 260 personnes a été interrogé dans l'enquête finale. Toutefois, pour des raisons de non-conformité des questionnaires, nous avons dû éliminer quatre observations ce qui réduit la taille de l'échantillon à 256 personnes. Les répondants ont été invités de manière aléatoire à chacune des cinq cellules du traitement.

Le déroulement de l'expérimentation

Les annonces étudiées ont été incorporées dans un extrait de magazine de divertissement, ainsi que cinq publicités "leurres". Les annonces étudiées ont été insérées en page de droite faisant face à un article, conformément aux principes de mise en page généralement pratiqués dans les magazines. Certaines doubles pages peuvent, néanmoins, être occupées par des séries d'images ou d'articles. Cette procédure a été répétée cinq fois pour prendre en compte l'ensemble des annonces manipulées (cinq magazines factices ont été produits). La place des articles et des publicités leurres n'a pas été modifiée, mais seulement celle des publicités étudiées. Celles-ci sont insérées selon un ordre aléatoire, de manière à éviter les effets d'ordre et de récence. Les publicités "leurres" portaient sur des catégories de produits différentes de celles qui sont testées. Celles-ci sont choisies de façon à posséder un faible contenu émotionnel : elles servent alors de publicités de "contrôle". Cette manipulation permet d'augmenter la crédibilité de l'enquête en présentant la publicité comme une annonce réelle et d'introduire un certain univers de concurrence publicitaire et plus généralement un univers informatif.

L'expérimentation finale s'est déroulée comme suit : Une première partie du questionnaire est administrée au répondant afin de mesurer ses tendances individuelles à l'égard d'un stimulus, à savoir son besoin d'émotion, son besoin de structuration, son besoin de cognition et sa tolérance à l'ambiguité. Une fausse revue est feuilletée par le répondant dans un ordre chronologique. L'enquêteur s'arrête sur la dernière annonce du magazine. Une deuxième partie du questionnaire est administrée dans les secondes suivantes à l'exposition publicitaire, afin d'évaluer les réactions affectives ressenties spontanément face à l'annonce. Le répondant est invité à répondre de manière spontanée et sans réfléchir. Le questionnaire auto-administré est un moyen d'obtenir des réponses anonymes, favorisant la sincérité. Une troisième partie du questionnaire est présentée au répondant afin de mesurer son attitude envers la publicité, son attitude envers la marque et son intension d'achat.

Mesure de la fiabilité et la validité des échelles :

L'analyse exploratoire a été conduite sous SPSS 11. La dimensionnalité des échelles de mesure a été évaluée par une analyse en composantes principales (ACP) avec rotation Varimax. Les items qui ont une faible contribution factorielle ou ceux dont les contributions sont partagées entre plusieurs axes, ont été éliminé. Tous les items retenus ont des contributions factorielles supérieures à 0,7. La fiabilité et la cohérence interne des items constituant une seule dimension ont été évaluées par le coefficient alpha de Cronbach. Toutes les variables étudiées ont des coefficients alpha acceptables. Les échelles de mesure des variables attitude envers l'annonce, attitude envers la marque et intention d'achat sont tous unidimensionnelles. L'échelle de mesure des réactions émotionnelles est composée de trois dimensions avec des valeurs propres supérieures à 1, respectivement 14.012 ; 4.990 et 1.656 ; qui expliquent plus de 73.781 % de la variance totale de l'échantillon. La première dimension regroupe les items relatifs aux réactions émotionnelles positives. La deuxième dimension regroupe les items relatifs aux réactions émotionnelles d'éveil. (Formel et Larker, 1981)

Dans une deuxième phase, une analyse factorielle confirmatoire a été réalisée sous Lisrel 8.3 afin de tester les validités discriminante et convergente des construits (Roussel, Durrieu, Campoy et Akremi, 2002). À l'issue de cette étape toutes les variables ont été retenues vu que les contributions factorielles sont acceptables. Les analyses de la validité des construits donnent des résultats acceptables. Les indices d'ajustement sont considérés comme bons, étant donné la complexité du modèle et la taille de l'échantillon relativement faible par rapport aux autres études faites sur le TAM. Le premier indice (*Chi-2/ddl*) satisfait le seuil préconisé de 2 à 5. Le RMSEA est inférieur au seuil plafond de 0,08. Le CFI est supérieur au seuil critique de 0,9. Le GFI peut être considéré comme satisfaisant dans la mesure où sa valeur est supérieure au seuil préconisé de 0,9. L'ajustement du modèle de mesure est par conséquent considéré satisfaisant. (Bergkvist et Rossiter, 2008)

Resultats

Impact de l'intégration émotionnelle sur les réactions émotionnelles des répondants et sur l'efficacité publicitaire :

Afin de vérifier l'effet de la mise en scène de l'émotion dans la publicité à travers la variable intégration émotionnelle sur les réactions émotionnelles des répondants et sur les variables de l'efficacité publicitaire, nous avons eu recours au test d'égalité des moyennes. Ce test permet de tester l'égalité de la moyenne d'une variable sur deux groupes d'observations définis par une variable qualitative. On émet deux hypothèses : l'hypothèse H0 selon laquelle il y a égalité des moyennes et l'hypothèse H1, selon laquelle, il n'y a pas d'égalité des moyennes entre les deux populations.

Nous calculons, ensuite, le test de Student en partant des caractéristiques des deux groupes d'expérimentation. Si ce test est significatif, nous pouvons procéder au test d'égalité des moyennes. Dans ce cas de figure, nous relevons que si la différence de moyenne appartient à l'intervalle de confiance, l'hypothèse neutre H0, selon laquelle il y a égalité des moyennes est rejetée et l'hypothèse H1, selon laquelle il n'y a pas égalité des moyennes, est acceptée. Si par contre la différence de moyenne n'appartient pas à l'intervalle de confiance, l'hypothèse H0, selon laquelle il y a égalité des moyennes, est acceptée et l'hypothèse H1 est rejetée.

Afin de mieux cerner l'impact de la variable intégration émotionnelle, nous avons étudié séparément l'effet de chaque composante de la mise en scène de l'émotion, à savoir : la saillance de l'émotion, la clarté de l'émotion et la présence d'information visuelle du produit, sur les réponses émotionnelles positives des répondants et sur les variables de l'efficacité publicitaire.

L'effet de la saillance sur les réactions émotionnelles et sur l'efficacité publicitaire :

Afin de vérifier l'influence positive de la saillance de l'émotion sur les réactions émotionnelles des répondants et sur les variables de l'efficacité publicitaire, nous avons réalisé un test d'égalité des moyennes

de la variable émotions positives et des variables de l'efficacité publicitaire entre le groupe d'expérimentation n°2 et le groupe d'expérimentation n°4. En effet, l'expérimentation n°2 est caractérisée par : la présence d'information visuelle du produit, la forte saillance de l'émotion et la non clarté de l'émotion montrée dans l'annonce. Par contre, l'expérimentation n°4 est caractérisée par : la présence d'information visuelle du produit, la non saillance de l'émotion et la non clarté de l'émotion dans l'annonce. La seule variable qui différencie ces deux groupes est la variable saillance de l'émotion.

Suite au test d'égalité des moyennes, nous remarquons que les différences des moyennes des émotions positives et des variables de l'efficacité publicitaire appartiennent tous aux intervalles de confiance. L'hypothèse neutre selon laquelle il y a égalité des moyennes est donc rejetée. En effet, il y a bien une différence des moyennes pour la variable émotions positives et pour les variables de l'efficacité publicitaire, à savoir l'attitude envers l'annonce, l'attitude envers la marque et l'intention d'achat et ce, entre le groupe d'expérimentation n°2 et le groupe d'expérimentation n°4. On peut donc conclure que les publicités qui montrent les émotions de manière saillante engendrent plus d'émotions positives et provoque des attitudes envers l'annonce, des attitude envers la marque et des intention d'achat plus favorable que les annonces qui montrent l'émotion de manière peu saillante.

L'effet de la clarté du rôle de l'émotion sur les réactions émotionnelles et sur l'efficacité publicitaire :

Afin de vérifier l'impact positif de la clarté du rôle de l'émotion sur les réactions émotionnelles des répondants et sur les variables de l'efficacité publicitaire, nous avons réalisé un test d'égalité des moyennes des émotions positives et des variables de l'efficacité publicitaire entre le groupe d'expérimentation n°1 et le groupe d'expérimentation n°2. En effet, l'expérimentation n°1 est caractérisée par : la présence d'information visuelle du produit, la forte saillance de l'émotion et la clarté de l'émotion dans l'annonce. Par contre, l'expérimentation n°2 est caractérisée par : la présence d'information visuelle du produit, la forte saillance de l'émotion et la non clarté de l'émotion dans l'annonce. La seule variable qui différencie ces deux groupes est la variable clarté de l'émotion.

Suite au test d'égalité des moyennes, nous remarquons que les différences des moyennes des émotions positives et des variables de l'efficacité publicitaire appartiennent tous à l'intervalle de confiance. L'hypothèse neutre selon laquelle il y a égalité des moyennes est donc rejetée. En effet, il y a bien une différence des moyennes pour la variable émotion positive et les variables de l'efficacité publicitaire entre le groupe d'expérimentation n°1 et le groupe d'expérimentation n°2. Nous pouvons donc conclure que les publicités qui montrent les émotions de manière claire engendrent plus d'émotions positives et provoque des attitudes envers l'annonce des attitude envers la marque et des intention d'achat plus favorable que les annonces qui montrent l'émotion de manière peu claire.

L'effet de la présence d'information visuelle sur le produit sur les réactions émotionnelles et sur l'efficacité publicitaire :

Afin de vérifier l'effet positif de la présence d'information visuelle sur le produit sur les réactions émotionnelles des répondants et sur les variables de l'efficacité publicitaire, nous avons réalisé un test d'égalité des moyennes des émotions positives et des variables de l'efficacité publicitaire entre le groupe d'expérimentation n°2 et le groupe d'expérimentation n°3. En effet, l'expérimentation n°2 est caractérisée par : la présence d'information visuelle du produit, la forte saillance de l'émotion et la non clarté de l'émotion dans l'annonce. Par contre, l'expérimentation n°3 est caractérisée par : l'absence d'information visuelle du produit, la forte saillance de l'émotion et la non clarté de l'émotion dans l'annonce. La seule variable qui différencie ces deux groupes est la variable information visuelle du produit.

Suite au test d'égalité des moyennes, nous remarquons que les différences des moyennes des émotions positives et des variables de l'efficacité publicitaire appartiennent tous à l'intervalle de confiance. L'hypothèse neutre selon laquelle il y a égalité des moyennes est donc rejetée. En effet, il y a bien une différence des moyennes pour la variable émotion positive et les variables de l'efficacité publicitaire entre le groupe d'expérimentation n°2 et le groupe d'expérimentation n°4. Nous pouvons donc conclure que les publicités qui présentent une information visuelle sur le produit de la marque engendrent plus d'émotions

positives et provoque des attitudes envers l'annonce des attitude envers la marque et des intention d'achat plus favorable que les annonces qui ne présentent pas d'information visuelle sur le produit.

Pour conclure, nous pouvons affirmer que l'impact positif de l'intégration émotionnelle sur les réactions émotionnelles des répondants et sur l'efficacité publicitaire est confirmé. En effet, les publicités qui possèdent un aspect intégré engendrent des émotions positives plus fortes, des attitudes envers l'annonce et la marque plus favorables et des intentions d'achat plus importantes que les publicités qui possèdent un aspect ambigu.

Impact des réactions émotionnelles sur l'efficacité publicitaire :

Afin de vérifier l'influence positive des réactions émotionnelles des répondants sur les variables de l'efficacité publicitaire, nous avons calculé le coefficient de corrélation des rangs ou le Rhô de Spearman. C'est un indice statistique compris entre -1 et 1 qui exprime l'intensité et le sens (positif ou négatif) de la relation monotone entre deux variables qualitatives. Il s'interprète de la même manière qu'un coefficient de corrélation de Pearson, mais contrairement à lui, il permet de mesurer non seulement les corrélations linéaires simples mais toutes les corrélations quelque soit leurs formes. Une valeur positive du Rhô de Spearman (maximum = +1) indique une variation simultanée dans le même sens, une valeur négative (minimum = -1) indique une variation simultanée en sens inverse.

Les coefficients de corrélation des rangs ou Rhô de Spearman entre les variables réactions émotionnelles positives, attitude envers le message, attitude envers la marque et intention d'achat sont tous entre 0.6 et 0.9. C'est des coefficients qui sont proche de 1, ce qui dénote des corrélations significatives entre les quatre variables et en plus ils sont positifs, ce qui indique des variations simultanées des quatre variables dans un même sens. Nous pouvons donc conclure que plus une annonce provoque des émotions positives et plus les attitudes des récepteurs envers l'annonce et la marque ainsi que leurs intentions d'achat sont élevées. De même, plus les récepteurs ont des attitudes favorables envers le message plus leurs attitudes envers la marque et leurs intentions d'achat seront élevées. Pour finir, plus les récepteurs ont des attitudes positives envers la marque et plus leurs intentions d'achat sont élevées.

Nous pouvons donc affirmer que plus une publicité provoque des émotions positives et plus l'attitude du récepteur envers l'annonce et la marque, ainsi que son intention d'achat seront favorables. De même plus le récepteur a une attitude favorable envers le message plus son attitude envers la marque et son intention d'achat seront élevées, et plus il aura une attitude favorable envers la marque et plus son intention d'achat sera élevée.

Impact des variables modératrices :

Afin de d'étudier l'impact des variables psychologiques des répondants sur la relation entre la variable Intégration Emotionnelles et les réactions émotionnelles des répondeurs mais aussi leurs impact sur la relation entre les réactions émotionnelles des répondants et les variables de l'efficacité publicitaire, nous avons eu recours à l'analyse de covariance multivariée (MANCOVA).

Cette analyse a permis de dégager une différence significative entre les groupes. Cette différence est relevée au niveau de l'impact des variables modératrices, à savoir le besoin d'émotion, besoin de cognition, le besoin de structuration et la tolérance à l'ambiguité, sur la relation entre les réponses émotionnelles positives des répondants envers l'annonce et les variables d'efficacité publicitaire des répondants, mais aussi sur la relation entre les réponses émotionnelles positives des répondants et les variables de l'efficacité publicitaire. Cette différence significative est montrée par :

- Le Lambda de Wilks : Il s'agit d'une statistique utilisée par l'Analyse Factorielle Discriminante dans le but de tester si plusieurs groupes d'observations multivariées ont des moyennes significativement différentes. Cet indicateur examine donc les différences inter-groupes au regard de l'ensemble des dimensions disponibles et prises en compte par l'analyse. Il joue donc, dans le domaine multivarié, le même rôle que la statistique *F* de l'ANOVA univariée. Les Lambda de

Willks sont tous inférieurs à 0.90 ce qui prouve qu'il existe donc des différences significatives entre les groupes.

- La plus grande racine de Roy : En effet, cet indice est acceptable dans toutes les analyses réalisées et il permet de mesurer les différences inter-groupes sur la base de la variable ayant la plus grande valeur propre parmi l'ensemble des variables.
- La trace de Pillai et la trace de Hotelling : Ces deux indicateurs sont considérés comme des extensions du Lambda de Wilks dans le sens où leurs mesures intègrent l'ensemble des variables et peuvent être approchées par la statistique F.
- Une significativité acceptable pour les relations entre les variables étudiées.
- Une différence remarquable au niveau des scores, des sommes des carrés, entre les modèles qui met en relation les réactions émotionnelles du récepteur et les variables de l'efficacité publicitaire d'une part et les réactions émotionnelles et les variables de l'efficacité publicitaire d'autre part et le modèle où les variables modératrices sont intégrées.

A la lumière de ces résultats, nous pouvons conclure que les variables psychologiques des récepteurs jouent un rôle modérateur dans la relation entre la variable intégration émotionnelle et les réactions émotionnelles des répondants mais aussi dans la relation entre les réactions émotionnelles des récepteurs et les variables de l'efficacité publicitaire.

Afin de mieux cerner le rôle modérateur des variables psychologiques des répondants, nous avons réalisé en premier lieu une classification des nuées dynamiques en fonctions de ces variables, à savoir, le besoin d'émotion, le besoin de cognition, le besoin de structuration et la tolérance à l'ambiguité. Cette classification des nuées dynamiques a permis de diviser les répondants en quatre groupes homogènes qui sont : Les Emotifs, les Cognitifs, les Emotifs/Cognitifs et les Passifs.

Afin de savoir s'il y a une différence au niveau des réactions émotionnelles des récepteurs et des variables de l'efficacité publicitaire et ce, entre les quatre groupes de classification dans les cinq conditions expérimentales, nous avons eu recours au test d'égalité des moyennes. La différence des moyennes des réactions émotionnelles, des attitudes envers l'annonce, des attitudes envers la marque et des intentions d'achat des récepteurs des quatre groupes de classification dans les cinq conditions expérimentales appartiennent tous aux intervalles de confiance. Nous pouvons donc conclure que l'hypothèse neutre selon laquelle il y a égalité des moyennes entre les différents groupes de classification est rejetée dans les cinq conditions expérimentales et ce, pour toutes les réactions émotionnelles et les variables de l'efficacité publicitaire. En effet, il y a bien des différences significatives entre les quatre groupes de classification pour les variables réactions émotionnelles et efficacité publicitaire dans les cinq conditions expérimentales. En suite, et par une étude des moyennes de chaque groupe, nous avons pu établir les conclusions suivantes :

- ***Les Emotifs :*** Ceux sont des personnes qui sont caractérisés par : un grand besoin d'émotion, un faible besoin de structuration, un faible besoin de cognition et une faible tolérance à l'ambiguité. Ils sont donc attirées par les stimuli émotionnels, vu leur fort besoin d'émotion. Ils sont incapables d'élaborer des structures cognitives simples pour comprendre des annonces complexes ou ambigues. Ils n'éprouvent, par conséquent, aucun plaisir à s'engager dans un processus de raisonnement poussé et ils rejettent donc les messages ambigus ou complexes. Les résultats trouvés confirment ce profil, vu que ce groupe a obtenu les moyennes les plus élevées au niveau des émotions positives et des variables de l'efficacité publicitaire suite au visionnage des publicités intégrées. Nous pouvons donc conclure que le groupe des Emotifs sont des personnes, pour lesquelles, la présence visuelle du produit et de son consommateur potentiel exprimant des émotions positives de préférence pendant la consommation du produit, est très importante pour que la publicité génère des émotions positives et pour être efficace. Il s'agit, par conséquent de personnes qui aiment les publicités où l'émotion est montrée de manière saillante, c'est-à-dire, des publicités qui montrent des acteurs qui expriment des émotions positives. Mais il faut aussi que cette publicité soit claire au sujet des conséquences émotionnelles de la consommation de la marque, c'est-à-dire, que l'utilisateur potentiel est clairement montré en train de vivre de l'émotion pendant la consommation de la marque. C'est ce qui explique pourquoi les Emotifs n'ont pas du tout aimé les publicités ambigues. Ils ont éprouvé suite au visionnage de ces publicités le moins

d'émotions positives, le plus d'émotion négatives et d'éveil. Donc, l'attitude envers la publicité, l'attitude envers la marque et l'intention d'achat les plus défavorables. Nous pouvons conclure que les Emotifs sont très sensibles aux publicités émotionnelles surtout lorsqu'elles sont intégrées.

- ***Les Cognitifs*** et les ***Emotifs/Cognitifs :*** les premiers sont caractérisés par : un faible besoin d'émotion, un fort besoin de structuration, un fort besoin de cognition et une grande tolérance à l'ambiguité. Les deuxième ont les mêmes caractéristiques que les Cognitifs sauf qu'ils ont aussi un fort besoin d'émotion. Les individus appartenant à ces deux groupes sont capables d'élaborer des structures cognitives simples pour comprendre des annonces complexes ou ambigues. Ils éprouvent du plaisir à s'engager dans un processus de raisonnement poussé. La seule caractéristique qui différencie ces deux profils c'est que les premiers préfèrent les stimuli émotionnels tandis que les seconds préfèrent les stimuli rationnels. D'après les résultats obtenus, nous avons remarqué que les deux groupes de personnes ont une préférence pour les publicités ambigues, à savoir, la publicité n°5 qui est une publicité dans laquelle l'émotion n'est pas exprimée par une consommatrice potentielle mais par un objet inanimé et congruent avec le produit mais le produit en lui-même n'est pas montré, et la publicité n°3 qui ne montre pas le produit mais une consommatrice potentielle du produit qui exprime des émotions positives. La seule différence entre les deux groupes est que les Emotifs/Cognitifs sont beaucoup plus sensibles aux publicités émotionnelles. Ces derniers éprouvent des émotions positives plus intenses suite au visionnage des publicités que les cognitifs. Ils ont de ce fait des scores plus élevés au niveau des variables de l'efficacité publicitaire. Nous constatons aussi que les Emotifs/Cognitifs sont des personnes qui peuvent apprécier, certes à moindre mesure, des publicités intégrées, pour lesquelles ils ont des moyennes assez élevées, au niveau des émotions positives et des variables de l'efficacité publicitaire. Nous pouvons conclure que les Emotifs/Cognitifs sont attirées par toutes les publicités émotionnelles, surtout lorsqu'elles sont ambigues.

- ***Les Passifs :*** Ils sont caractérisés par un faible besoin d'émotion, un faible besoin de structuration, un faible besoin de cognition et une faible tolérance à l'ambiguité. Ils ont un profil psychologique totalement à l'opposé des Emotifs/Cognitifs. Il s'agit d'individus qui n'aiment pas les situations et les stimuli émotionnels. Ils n'arrivent pas à élaborer des structures cognitives simples pour comprendre des annonces complexes ou ambigues. Ils n'éprouvent, par conséquence, aucun plaisir à s'engager dans un processus de raisonnement poussé et ils rejettent les situations ou les messages ambigus ou complexes. D'après les résultats obtenus, nous avons remarqué que les Passifs ont obtenu les moyennes les plus élevées au niveau des réactions émotionnelles positives et des variables de l'efficacité publicitaire pour les publicités où le packshot du produit est clairement montré, mais où il n'y a pas de consommatrice potentielle du produit qui exprime des émotions. Ces résultats montrent que les Passifs sont des personnes pour qui la présence visuelle du produit est indispensable pour que la publicité soit efficace, vu qu'ils n'aiment pas les publicités complexe et ambigues où l'image du produit n'est pas montrée mais suggérée. Il s'agit de personnes qui préfèrent les publicités avec une faible connotation émotionnelles, où on ne montre pas d'acteurs exprimant des émotions positives. Nous pouvons conclure que les Passifs sont attirés par les publicités faiblement émotionnelles et intégrées.

Discussion, Limites et Voies Futures de Recherche

Conformément à ce que nous postulions, les résultats obtenus confirment l'effet de la variable intégration émotionnelle, à savoir, la saillance de l'émotion, la clarté du rôle de l'émotion et la présence d'information visuelle du produit, sur les variables de l'efficacité publicitaire et ce à travers le rôle médiateur des réponses émotionnelles positives des répondants.

En effet, une publicité Intégrée qui est caractérisée par une forte saillante, c'est-à-dire où les acteurs expriment des émotions positives, où le packshot du produit est mis en valeur et surtout qui montre clairement les conséquences émotionnelles de l'utilisation de la marque en montrant que l'émotion positive exprimée par les acteurs est due à la consommation ou l'utilisation de la marque, est une publicité qui a une

probabilité plus importante de provoquer des émotions positives et par conséquent d'induire une attitude envers l'annonce et la marque, ainsi qu'une intention d'achat plus favorable qu'une publicité ambigue.

Ces relations sont néanmoins modérées par les variables psychologiques des récepteurs. En effet, ces derniers ont des perceptions différentes de la mise en scène de la publicité en fonction de leur besoin d'émotion, leur besoin de cognition, leur besoin de structuration et leur tolérance à l'ambiguité. Afin de mieux cerner l'impact de ces variables modératrices, nous avons réalisé une classification des nuées dynamiques, qui nous a permis de segmenter les récepteurs en quatre segments distincts en fonction de leurs profils psychologiques. Nous avons remarqué que ces quatre segments ont des préférences très distinctes en termes de mise en scène de l'émotion dans la publicité.

Nous avons remarqué que les publicités émotionnelles fortement intégrées sont très appréciées par le segment des Emotifs. Ceux sont des personnes qui préfèrent les publicités qui montrent clairement des acteurs qui expriment des émotions positives suite à la consommation du produit. Les publicités émotionnelles ambigues sont plutôt appréciées par les Cognitifs et les Cognitifs/Emotifs qui préfèrent les publicités qui stimulent leur imagination et qui satisfassent leurs besoins de cognition en remplaçant par exemple la marque ou l'acteur par une atmosphère ou un objet congruent (dans notre cas une boule de lumière, une main tendue, etc.). Le dernier segment qui est composé des Passifs est surtout attiré par les publicités intégrées et faiblement émotionnelles. Ceux sont des personnes qui préfèrent les annonces avec une faible connotation émotionnelle où les acteurs qui expriment des émotions positives ne sont pas montrés mais sont remplacés par un objet congruent (exemple une main tendue) mais il faut surtout que le packshot du produit soit clairement montré pour que la publicité soit efficace.

Les publicitaires ont donc intérêt à bien réfléchir à la mise en scène de leurs publicités émotionnelles et surtout de l'adapter au profil psychologique de leur cible. Cette recherche essaie d'offrir donc une aide précieuse aux publicitaires et ce, pour deux raisons :

- Elle propose une segmentation de l'audience en fonction des caractéristiques psychologiques des récepteurs.
- Elle donne une attribution des préférences de chaque segment pour chaque type de mise en scène de l'émotion dans la publicité, et ce, à travers le concept d'intégration émotionnelle.

Si cette étude permet la compréhension du processus de persuasion des communications publicitaires et ce, par l'intervention des émotions suscitées par les caractéristiques de mise en scène de l'émotion, à travers le concept d'intégration émotionnelles. Il n'en demeure pas moins qu'elle représente quelques limites, qui vont déboucher sur des voies futures de recherche.

Il est à souligner que les conditions d'exposition forcée aux publicités des magazines sont loin d'être des conditions réelles d'exposition, bien que nous avons essayé de se rapprocher de la réalité. En effet, l'annonce étudiée a été incorporée dans un extrait de magazine de divertissement, ainsi que cinq publicités "leurres".

Il est à relever que le média publicité magazine ne permet d'éveiller que le sens de la vue. Tandis que la télévision, par exemple, permet non seulement d'éveiller le sens de la vue mais aussi le sens de l'audition. En effet, dans le cas de média faisant appel à un seul sens, l'appel aux émotions est plus complexe à réaliser.

En outre, dans un souci de clarté, certaines variables influentes n'ont pas été intégrées dans le modèle de persuasion publicitaire. Il semble que plusieurs variables peuvent éclairer de manière intéressante l'impact des émotions, en particulier l'implication du sujet ou son humeur ou son attitude vis-à-vis de la publicité en générale.

En ce qui concerne les variables de mise en scène de l'émotion dans l'annonce utilisé, nous nous sommes limités à la manipulation de la variable intégration émotionnelle avec ses trois composantes à savoir, la saillance de l'émotion, la clarté de l'émotion et la présence d'information visuelle du produit. Une

investigation des autres variables de mise en scène de l'émotion serait une voie future de recherche intéressante.

Abstract

Selection, pre-processing, transformation, evaluation and interpretation of information is crucial for nowadays business. One modern approach to dealing with information processing is based on fuzzy theory. This paper suggests the usage of fuzzy approach for evaluating a bank´s client. In the article fuzzy inference systems based on Mamdani implication is offered for this task.

Keywords: fuzzy sets – fuzzy rules – fuzzy inference system – mortgage

Introduction

In the world of business, knowledge of information is becoming increasingly important. Despite living in a world which is very unstable, complex and hardly deterministic, we need to have exact and precise information for decision making. That is why, we need to investigate a better solution for selecting, pre-processing, transforming, evaluating and interpreting data. This paper is aimed at information processing in the banking sector.

Due to a market collapse in 2007 when created credit derivatives allowed banks on the Wall Street worked with the obligation secured by inadequate and poor quality mortgages nowadays banks very carefully chosen their clients. The situation is even more complicated when the Czech National Bank set negative interest rate as its policy again weak Czech currency. Thus banks need very fast and precise evaluation of bond´s and stock´s market to estimate future development as well as evaluating each of their clients.

Employees in the bank make numerous decisions every daily, related with client´s mortgages, loans and investments. In most cases, banks have very imprecise and vague information about the client. For processing and evaluating data, we can use basic approaches based on probabilistic theory and Boolean algebra and algebraic model as vectors, matrices and tuples (Golitsyna & Maksimov, 2011).

Concerning the importance of discussion about evaluating large dataset in banks, it seems necessary to think about using a fuzzy approach method in order to determine all criterions and key factors because the complexity is only increasing and effectively analyze the client data is become key of the bank-client relationship management.

The literature is rich of research used instruments of statistical and econometric type. The paper of Afshari at. al (2011) proposed for evaluating bank´s function in organization balanced score card model. During the evaluation four aspects of BSC were used for evaluating and assessing banks that have been designated through studying perspectives, missions, solutions, banks' aims, overview of research literature, criterions, and sub criterions. After gathering data related to every criterion, decision matrix was formed and banks were ranked by utilization of SAW, VIKOR, and TOPSIS techniques. The paper of Rost and Tlusty (2013) compares two different classification tools for evaluation of the bonity clients. In this paper is compared SRM (mix of neural network, SVM and other modern tools) methodology represents by Knowledge extraction engine analytical network (KXEN) and classical data mining method CRISP (Cross-Industry Standard Process for Data Mining) represents by programming environment R Recently literature brought new approaches based on fuzzy logic and neural networks. The recent work of Magne and Kaymak (2001) discusses extension

of fuzzy clustering algorithm and its next application for example target selection from large databases for direct marketing purposes. The article published by Che, Wang and Chuang (2010) focuses on small and medium enterprises, by using Fuzzy Analytic Hierarchy Process (FAHP) to choose the important index in loaning evaluation, to establish a complete and efficient loaning decision-making module with its weights and Data Envelopment Analysis (DEA), and make effective protection against high ratio of overdue loaning. In the paper by Facchinetti and Mastroleo (2005) it is proposes two fuzzy methods (a fuzzy expert system and a fuzzy cluster method) for bank evaluation of clients in lending credit, based on qualitative attributes. Based on the model of service quality of commercial banks, according to Chinese current situation, the paper from Liu and Chen (2013) puts forward an evaluation method using the FAHP-FUZZY model of service quality evaluation, in order to promote the continuous improvement of commercial banking service quality. Baetge and Heitmann (2000) introduces a fuzzy rule-based expert system that replicates mathematically the expert knowledge of a loan officer. Fuzzy logic (FI) model can be an effective tool in assessing and evaluating of e-banking security performance and quality. Aburrous et al. (2008) proposed an intelligent performance assessment model for evaluating e-banking security websites based on FI operators and produces four measures of security risk attack dimensions: direct internal attack, communication tampering attack, code programming attack and denial of service attack with a hierarchical ring layer structure. The recent work of Rajeh, Koudehi, Seyedhosseini and Farazmand (2014) instroduced a new approach based on fuzzy theory for segmentation customers based on loyalty in Iranian Bank. They proposed a new procedure using the indexes of RFM model with two new additional indexes joining k-means algorithm with k-optimum according to davies - bouldin index in order to estimate customers' loyalty numbers and then classifying customers in for groups based on expanding the Dick- Basu model with using fuzzy concept.

Methodology

The founder of fuzzy theory is Lotfi Askar Zadeh. He introduces fuzzy theory in his paper Fuzzy sets in 1965. Zadeh came up with an idea of using fuzzy logic rather than a probabilistic model for the processing of information (Zadeh, 1965). Nußbaum (1975) wrote in his book proclamation: "Probability does not exist. It is a subjective description of a person´s uncertainty. " Nußbaum (1975) also mentioned calculus of probability which can say absolutely nothing about reality. For this reason interpretation of calculus would lead to an incorrect or misleading solution. The uncertainty within natural language appears because of problems with complexity, ignorance, various classes of randomness, the inability to perform adequate measurements and lack of knowledge or vagueness in the natural language (Ross, 2010). Despite accurately applying uncertain data we achieve dubious results. When Lotfi Askar Zadeh offered fuzzy sets for the first time, the fuzzy theory represented a framework which provided a natural way of dealing with problems in which the source of imprecision is the absence of sharply defined criteria of class membership rather than the presence of random variables (Zadeh, 1965). There are a small amount of problems in the world, which are clearly defined. Hence, fuzzy sets provide a mathematical way to express vagueness and fuzziness in humanistic systems (Ross, 2010). We use fuzzy sets in a situations when we cannot precisely define borders according to which we will decide which set a given object belongs. A nice example is the sorites paradox (the paradox of the heap). The sorites paradox starts with the question asking for how many grains of sand is a heap of sand. Is it one grain? No. Is it two grains? No. Is it three grains? No. etc. So how many grains do we need to have a heap? We cannot mathematically express how many grains we need. Further examples are which of these numbers are close to zero or how many people is a crowd. In contrast to classical sets theory, where elements belong/not belong in a set, and fuzzy theory measures elements in the sets by a membership function. The value of membership function is called membership value (Dubois, Prade & Yager, 1996).

A fuzzy set contains elements with varying degrees of membership to the set and is characterized by the membership function, which assigns each element its degree of membership between zero and one (Zadeh, 1965). If we have element x in the universe 'U' and is a member of fuzzy sets A it is visualized as $\mathbf{A = \{(x, \mu A(x)) \mid x \in U\}}$. The degree of membership is symbolized by $\mathbf{\mu A(x) \in \langle 0, 1 \rangle}$.

Fuzzy rule: IF antecedent THEN consequent, is important for description fuzzy system. Both antecedent and consequent are expressed by fuzzy sets. Hence, IF-THEN rule shows fuzzy implication, which express the relationship between statements. The consequent is a result of fuzzy implication. Statement´s value belongs to <0, 1>. A fuzzy statement consists of two parts. The first part is input for fuzzy variables, the second part is output which is fuzzy set. Statements could contain logical operators such as AND and OR. Thus obtain statements is called complex statement (Holecek, Talasová & Müller, 2012). According to Dubois and Prade (1992) we have four basic types of fuzzy rules.

Fuzzy system

The importance of a fuzzy system is shown in the situation where it is addressed in text in natural language to an intelligent machine based on binary logics. When probabilistic theory will be used during evaluating text, the inherent fuzziness in the text will be removed as well as the statements being precisely defined. Hence, the originality (uncertainty) of nature language will be lost (Ross, 2010). The fuzzy system is specified by fuzzy sets, rules and methods. In fuzzy systems some of the variables (at least one possibly all) gain values, which are not easily characterised by real numbers. Fuzzy systems are very useful on two main situations - we have highly complex systems whose behavior is not well understood and in the situation where an approximate but a fast solution is wanted (Ross, 2010). The most common use fuzzy system is based on Mamdani or Takagi - Sugeno - Kang method (Sugeno, 1985). This article recommends the fuzzy system based on Mamdani fuzzy inference. Algorithm of the fuzzy inference system contains three following steps (figure 1): fuzzification → fuzzy inference → defuzzification. Crisp value is inserted during the first step into the system. Input is in the canonical (atomic) form (Mamdani, 1977).

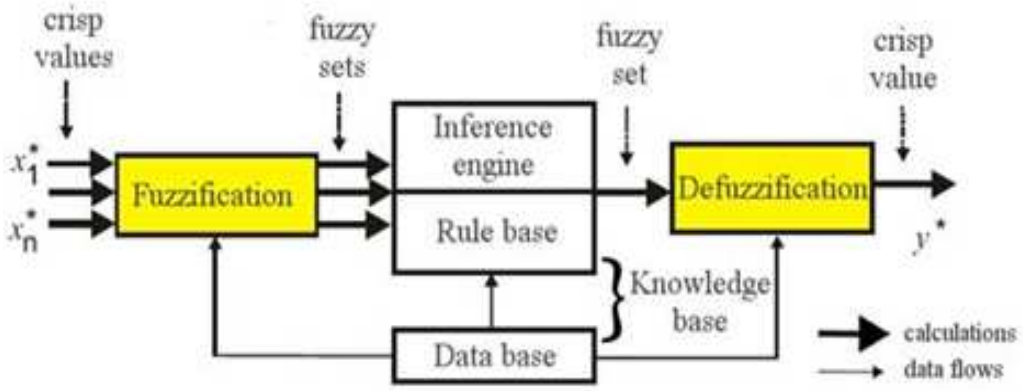

Fig. 1: Fuzzy inference system, Source: Center for inVestigations into Information Systems (Smolova & Pech, 2010)

Fuzzification is a process of taking the inputs and estimating the input´s degree of membership to the appropriate fuzzy sets by a membership function. Thus, the result of fuzzification is a fuzzy degree membership in the qualifying linguistic sets with the interval between 0 and 1. The next step includes the creation of rule bases which describe outputs when the input has the exact value. While using the fuzzy inference mechanism based on Mamdani implication we gain from the fuzzy input and rule base fuzzy value output. Next step, defuzzification is a process where a single number is matched to all fuzzy sets create during fuzzy inference. Despite the fact that in the whole process performing fuzzy sets, the output is a single crisp number. To the most useful methods of defuzzification belong centroid (method returns the center of area under curve), bisector (method returns a vertical line that divide the area into two equal sub-areas, in some cases centroid is the same line as the bisector line) and largest, middle and smallest of maximum (three methods assumed the maximum value by the aggregate membership function). Choosing the methods depends on which input methods have been

used, but generally the centroid method generates adequate results. While using the Fuzzy Logic's Toolbox for defuzzification, you can change the used methods and the results can be seen from a different perspective.

Application of fuzzy system

This paper suggests using fuzzy inference system for evaluation clients who take a mortgage. The potential value of clients is the intangible and prospective value of clients (Zheng and Dong, 2006). There are several aspects of interest to banks such as age (young, productive, retire), height of the salary (low, average, high, very high), property type (house, flat, cottage) and value (low, average, high), additional income (shares, bounds, other), type of employer (small-size business, middle-size business, multinational business, entrepreneurship), type of contract (permanent part-time job, permanent full-time job, fix part-time job, fix full-time job) and previous payments of loans (on time, small delay, big delay). Thus banks have a large amount variation of the value of each aspect. From this combination, the bank can create rules which are used in a fuzzy system. Some rules are shown in table 1. The rule base is growing with every single client. The rule base has IF antecedent THEN consequent character. An example of a rule is: IF client is in a productive age, has average income, has a cottage average value, additional income and works in a small-size business and has fix full-time job THEN his chance to get a mortgage is high. Not all aspects have to be involved in the rule. The rule can be defined by few statements. Antecedent represents complex statement and logical operators (AND or OR) connects each single statements. Chance of getting a mortgage represents consequent.

Table 1: Examples of IF-THEN rule Source: Own work

Age	Salary	Ps' type	Ps' value	Adition. Income	Employer´ s type	Contract type	Paying history	Chance getting mortgage
Retire	Law	Flat	Aver.		Middle-size business	Fix, part-time job		Very law
Youn.	High	Flat	Aver.		Middle-size business	Permanent, part-time job	Big delay	Law
Prod.	Aver.	Flat	Aver.	Other	Small-size business	Fix, full-time job	On time	High
Prod.	Very high	House	High	Bounds	Middle-size business	Permanent, full-time job		Very high

Each bank has its own criteria and evaluation. Table 1 does not cover all variations and aspects of a bank. In Fig.2 is example of evaluating client based on three basic rules (IF - THEN). The evaluating process embodies several stages. Firstly the bank´s employee gains all the data from a client and acquires input for fuzzy inference system. The next step is fuzzification where the input of real numbers is converted to fuzzy sets. The third step is fuzzy inference. During fuzzy inference, all the fuzzy rules are combined or aggregated into a single fuzzy set, whose membership function assigns a weighting for every value of chance of getting a mortgage. During next stage on the gain the fuzzy

set is applied to the chosen method of defuzzification. Hence the bank (client) reachs the single number representing the chance of getting a mortgage as it is shown in fig.2.

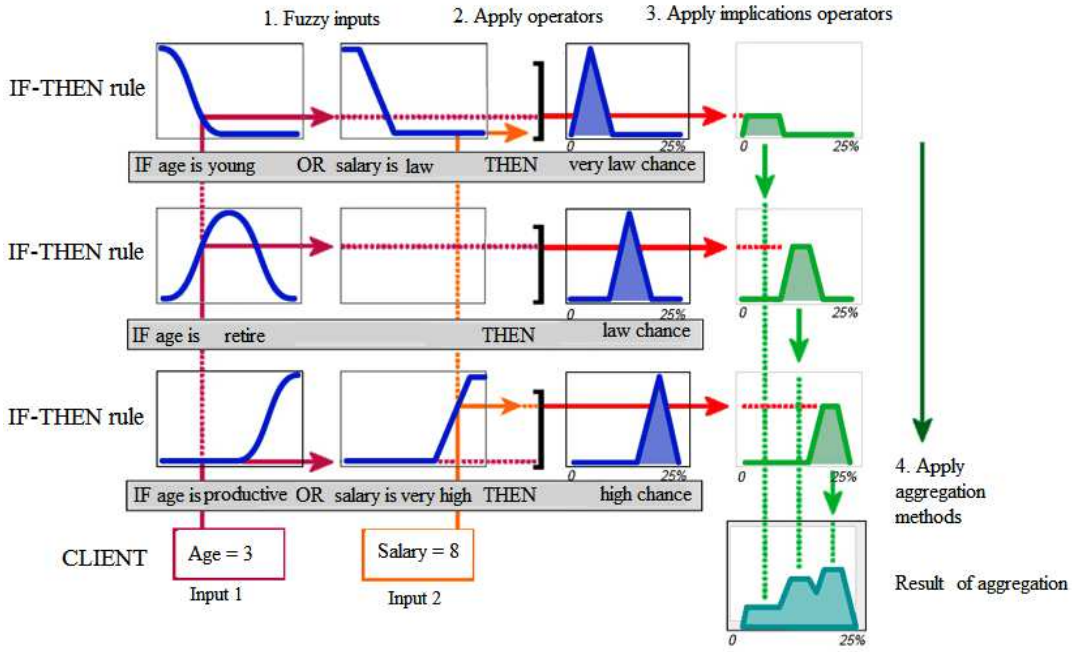

Fig.2: Examples of evaluation client, Source: Own work

Conclusion

The paper introduces an approach based on fuzzy logic to evaluation bank´s client based on their real values instead of based the segmentation of the clients only on their incoming value for the bank (Wu and Guan, 2012). The fuzzy theory has a huge impact for data processing across various industries. The fuzzy approach has been used in marketing (portfolio selection problem), business (investment selection problem), biology (fuzzy sets using genetic algorithm), engineering (expert system, controlling system) and banking (intelligent detection system for e-banking phishing website). The fuzzy theory still has potential to expand. Fuzzy algorithms are already well defined while using data in text format, but what about the database with numbers, pictures, sounds or websites? We should not forget while trying to formulate human´s knowledge and retrieve and exploit information what is a sufficient solution. Each person has the subjective scale of correctness, completeness and efficiency and for some users this can be simple and understandable results, making the best solution. Hence, the utility for users has to be taken into account as well. Thus, we are back to the case of how to measure the linguistic variables and usage of the fuzzy theory. Even the fuzzy systems and it's development are one of these newer tools for data processing, we have to keep thinking about new tools which will provide the better solution in all user´s aspects.

Energy Markets under MiFID 2 Legislation

Zuzana Stoličná, Faculty of Management of Comenius University, Bratislava, Slovakia,
zuzana.stolicna@fm.uniba.sk
Dalibor Černička, Faculty of Management of Comenius University, Bratislava, Slovakia,
dcernicka@gmail.com

Abstract

The majority of commodity trading companies were excluded from 2004 MiFID 1 legislation package. The European Union's new financial markets regulation, 2013 MiFID 2, redefines exemptions and companies licenced under MiFID 2 will be forced to comply with bank-like capital, capital and liquidity requirements and broad public disclosures. The regulation will force the companies to adopt new risk management and internal capital adequacy procedures as part of their internal processes.

Keywords: Energy markets – MiFID 2 – Regulation.

Introduction

An integrated EU energy market is the most cost-effective way to secure affordable supplies to EU citizens (EC, 2015). EU-wide energy market rules and cross-border infrastructure guarantee that energy can be produced in one EU country and delivered to consumers in another. Common European market keeps prices in check by creating competition and giving consumers choices when it comes to their energy supplier.

Energy trading is at the heart of Europe's liberalised energy markets. European Federation of Energy Traders (EFET, 2012) posited that competitive, liquid, sustainable and transparent wholesale energy markets are essential to deliver low-cost supplies to European energy consumers. They also help energy producers, suppliers, intermediaries and large consumers to reduce risk management costs. Moreover, transparent price discovery not only generates confidence among investors, but also, if properly appreciated, should reassure policymakers, regulators and consumers.

National electricity and gas markets opened up to competition around the turn of this century. The objective of adopted legislative packages was to ensure a functioning market and a high level of consumer protection as well as adequate levels of cross-border interconnections and generation capacities. The main aim of the first two directives was to avoid discrimination rather than improve European cross-border integration.

Boltz (2007) assumed that there was no evidence for natural market integration as potential losses at a national level were in many cases higher than potential gains from competition. Major price differences between markets in Europe sparked a discussion about wholesale markets indicating potential gains from competition. The third legislative package further liberalises internal energy market to avoid cross-border issues, regulates transmission network ownership and ensures more effective regulatory oversight.

EU energy market regulation

History of EU energy market regulation

Vasconcelos (2005) considers regulation as a modern and efficient interface between the public interest, the interests of consumers, the interests of those providing regulated services under monopolistic conditions and the interests of those using the monopolistic infrastructure.

The independent national energy regulators and the foundation of free energy markets are closely related to the 1987 Single European Act, which promoted integration of national markets towards a single European market and the "1992 Internal Market" agenda. The three concepts of liberalization, independent regulation and supra-national integration of electricity and natural gas markets stem from the EU Internal Market project and are inter-related.

Most energy regulatory authorities in Europe were founded in late 1990s when the first internal electricity market directive was approved. With the second internal electricity and natural gas market directives, adopted in 2003, independent energy regulatory authorities became mandatory in all member states.

The Agency for the Cooperation of Energy Regulators (ACER), a European Union Agency launched in 2011, was created by the Third Energy Package to further progress the completion of the internal energy market both for electricity and natural gas and can be seen as the central institution in the creation of a Single Energy Market. ACER is an independent European structure which fosters cooperation among European energy regulators and ensures that market integration and the harmonisation of regulatory frameworks are achieved within the framework of the EU's energy policy objectives (ACER, 2015).

Wholesale energy markets

Companies trading commodities specialise in analysing information that identifies optimal commodity transformations (spatial, temporal or transformation) in response to given price signals. Many of them seek to profit from differentials in prices of the untransformed and the transformed commodities (arbitrage involving the simultaneous purchase and sale of a commodity in different forms) rather than speculate on commodity price risk (profit on expected price movement).

Efficient wholesale markets play a crucial role in market integration throughout the continent. A closer look into price mechanism of natural gas contracts in Europe shows an increasing share of gas-to-gas competition (GOG), where the price of gas contracts is determined by the interplay of supply and demand on the wholesale markets and is traded over a variety of different periods, comparing to Oil-indexed prices of gas contracts (OPE), where the price is linked, usually through a base price and an escalation clause, to competing fuels, typically crude oil, gas oil and/or fuel oil. International Gas Union data demonstrate (IGU, 2015) that GOG contracts rose from 15 % in 2005 to 61 % in 2014 while OPE contracts declined from 78 % in 2005 to only 32 % in 2014.

Competition and increased liquidity on electricity markets led to an increase in cross-border electricity flow, new market-coupling areas were created (interconnection between national grids) to address different prices for electricity across Europe. Liquid wholesale markets also help national systems operators to cope with the massive expansion in renewable energy sources overloading existing grids in Europe.

Recent changes to the regulatory framework sparked a discussion about the future of wholesale markets as new legislation actions imposed additional costs (REMIT) and redefinition of business principles (MiFID 2).

MiFID 2

MiFID 1 (Directive 2004/39/EC on markets in financial instrument) contained generous exemptions (Article 2 (1) k) for companies trading commodities. As a result, the majority of market participants have not had to comply with rules like best execution, financial institutions-like capital requirements and governance requirements.

The non-application of many financial rules to the commodity industry, already started to crumble with the introduction of EMIR (Regulation No 648/2012 on OTC derivatives, central counterparties and trade repositories). Trade reporting and portfolio reconciliation rules imposed by EMIR were new for the energy markets, even if in some cases some best practices were already observed. This step can be seen as the first step to bring the energy and commodity business under increasing financial regulation, shifting the focus away from energy regulators.

New MiFID 2 (Directive 2014/65/EU) package redefines which companies and sectors will be covered with new regulations. The blanket commodities exemption is gone, leaving market participants reliant on the "ancillary exemption", which requires the entity to prove that trading is an "ancillary activity" to the company as a whole in order to keep the exemption. The crucial problem for energy market participants is the definition of ancillary business exemptions, the only way how to avoid legislations bank-like requirements.

The draft regulatory technical standards published at the end of 2014 required two tests: The "capital test" and the "market size" test The capital size test required the trading companies to show that the capital required to support their trading in derivatives consumes less than 5 % of their group capital. The original market size test required the trading companies to show that their trading activity is less than 0.5 % of the total EU market in any of eight types of commodities (gas, power, oil, emissions, coal, agriculture, metals and other). It was calculated by various bodies that a very large proportion of market participants would lose their exemption.

The final draft regulatory technical standards published on 28th September 2015 proposed two tests, that have to be passed cumulatively in order for investment activities to be considered as ancillary (and an exemption from MiFID 2 will apply for them):

a) the "trading activity thresholds" as the relationship between speculative activity and the overall EU market activity in each class of commodity derivatives (firms having a significant share of the market in a particular class of derivatives will not be allowed to benefit from the exemption) and

b) the "main business thresholds" shall determine whether investment activity is large in size relative to what the entity does as its main business.

If trading companies fall under the scope of MiFID 2, they will be treated as investment firms and new capital requirements under the banking regulatory framework (Capital Requirements Regulation – CRR and Capital Requirements Directive IV – CRD) will apply to them.

MiFID 2 together with Capital Requirement Directive and Capital Requirements Regulation, impose on commodity firms new obligations:

a) capital, liquidity adequacy and large exposure requirements;

b) public disclosure and reporting requirements;

c) risk management (ICAAP and SREP, internal risk models).

For companies regulated under MiFID 2 legislation, new bank-like capital requirements - capital disclosure obligations and own capital and liquidity requirements – will apply. Capital requirements legislation requires institutions to comply with capital ratios (capital to risk-weighted assets) for their CET1 (common equity core Tier 1), Tier 1 and Tier 2 capital.

Liquidity adequacy ratios include the liquidity coverage ratio (short-term resilience to liquidity risk) and the net stable funding ratio (available stable funding).

FIA (2015) considers that imposing of capital requirements obligations not suitable for commodity firms may be in conflict with the objectives of key policy frameworks such as the Third Energy Package, to foster liquidity and depth of trading in what were, and in many cases remain, relatively illiquid markets. Additional capital requirements on commodity firms are likely to lead to the withdrawal of many market participants, further damaging liquidity and market efficiency to the detriment of consumers.

Under CRR/CRD IV legislation, institutions are subject to new public disclosure and regulatory reporting. To improve the transparency of investment company activities, legislation requires annual disclosure of profits, taxes, subsidies, return on assets and risk management objectives and policies, leverage ratios and reporting to national regulatory bodies on regular basis.

Risk management based on the companies' own risk models (regulatory reviewed and approved), Internal Capital Adequacy Assessment Procedures (ICAAP), Supervisory Review and Revaluation Process (SREP) impose rules for assessing the firm’s capital and internal procedures for risk management, capital planning and its cyclical revaluation.

EFET (2015) stated, that new rules will impact market liquidity due to anticipated reduction of activity of energy and commodities trading companies. The knock-on effect of reduced liquidity on consumer energy prices would cost consumers in EU around € 6.8 bn yearly for every 1 % increase in final prices (in natural gas and electricity resulting from lower competition).

Discussion

Companies trading energy and commodities will have to be registered under MiFID 2 legislation and fall under scope of CRR/CRD IV, MAD 2/MAR legislation suited for investment companies and banks. New requirements imposed on energy and commodity trading companies will significantly affect their profits, as a result of new internal processes, capital cost, as a result of higher capital requirements and regulatory risk as a result of the bulk of regulatory reporting requirements.

According to various papers published by professional groups like FIA, ISDA or EFET, new requirements may have a very negative impact on market liquidity so important for smooth energy flow throughout Europe.

Management of Mobile Devices – How to Implement a New Strategy

Martin Brodin, University of Skövde, Skövde, Sweden, martin.brodin@his.se

Abstract.

Since smartphones entered the market the need for them has exploded, today 85 % believe that their mobile is a central part of their life. Despite the major focus on mobile devices and increased budgets, there are still many organisations missing a strategy for mobile devices. This article investigates the most important steps to take when implementing a mobile device strategy by conducting an empirical study with interviews with CIO or equivalent roles in 13 organisations with 50 to 15 000 employees. The result is an improved framework for mobile device implementation.

Keywords: Information Management, Mobile Device, BYOD, CYOD.

Introduction

Since smartphones entered the market the need for them has exploded, today 85 % believe that their mobile is a central part of their life (Salesforce 2014). Despite the major focus on mobile devices and increased budgets, there are still many organisations missing a strategy for mobile devices. These devices may cause organisational problems including unwanted disclosure of data and a new attack surface. A strategy may include policies and guidelines, but more important is that it aligns with company strategy and the organisational culture. Nevertheless, a recent survey revealed that only 42 % of the responding decision makers have a clear enterprise mobility strategy in place (Matrix42 2015). Even if they have a strategy this does not imply that it is implemented, the research literature shows a major gap when it comes to implementation of mobile device strategies (Brodin et al. 2015).

The use of mobile devices is certain to increase because of social trends. The ability to access information whenever and wherever you want has become very important for most people today (Salesforce 2014). If the organisation does not allow the user to access information outside the office the employees will probably try to find ways to do it anyway, which leads to security issues (Muth 2013; Walters 2013; Silic & Back 2014; Simkin 2013). Employees that are allowed to use mobile devices for both work and private purpose are more productive since they can manage small tasks during private time. There are reports that talk about savings for the organisation with up to 240 hours per year and employee (iPass 2011; Miller & Varga 2011). This gives the employer much to gain from allowing mobile devices in a controlled way.

Absence of implemented strategies in practice is a major problem for public and private enterprises large and small since the greatest threat is security and keeping control. This is something which is also lacking in the literature.

The objective of this paper is to investigate how strategies for mobile devices are implemented in practice through interviews with CIO or equivalent roles. Further an updated version of a mobile device management framework will be presented.

The research questions are therefore:

- What are the most important steps to take when implementing a mobile device strategy?
- How are mobile device strategies implemented in practice?

The study is a pre-structured qualitative investigation combined with a literature review. 13 interviews were conducted with CIO or equivalent roles in in small, medium and large companies and municipalities in Sweden.

The paper is structured as follows. Section two explains how literature looks at mobile device strategy, in section three the research method and analysis model are explained, section four presents the findings from the empirical study and section five introduces an improved version of the

framework. Finally, section six gives the conclusions of the analysis, and offers directions for future research.

Mobile device strategy in literature

Brodin (2015) has developed a framework (figure 1) for managing strategies for mobile devices from the first analysis to completely implemented. The framework is adapted from Johnson and Scholes (Johnson & Scholes 1993) seminal work on strategic management, and the international standards ISO/IEC 27001 (ISO/IEC 2013a) and ISO/IEC 27002 (ISO/IEC 2013b). It divides the tasks into three categories:

- *Analysis* – organisation before a strategy is in place, mostly about risks and opportunities.
- *Design* - dealing directly with strategies, different options and development.
- *Action* - about the implementation of strategies.

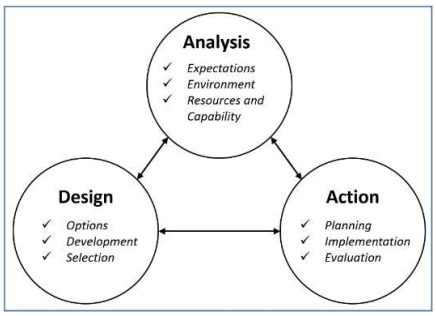

Fig. 1. A framework for implementing a mobile device strategy, adopted from (Brodin 2015).

Analysis

People who do research in this category mostly focus on opportunities and threats. When it comes to possible benefits that comes with the mobile devices the most common ones are increased personal productivity (Miller & Varga 2011; Dhumal et al. 2012; iPass 2011; Barbier et al. 2012), time/space flexibility (Singh & Phil 2012; Harris et al. 2012; iPass 2011; Green 2002; UNICEF 2014) and increased user satisfaction (Miller & Varga 2011; Disterer & Kleiner 2013; Harris et al. 2012).

Threats associated with mobile devices include fear of losing control over information (Pettey & Van Der Meulen 2012; Camp 2012; Walters 2013; Kehoe 2013) and the ability to protect all devices (Disterer & Kleiner 2013; Camp 2012; Walters 2013; Tokuyoshi 2013; Morrow 2012; Skype et al. 2012; Wilson 2012). Another thing that is feared to have a negative effect on the organisation is cost for support (Walters 2013; Harris et al. 2012; Intel 2012) although some argue that there will be no impact (Miller & Varga 2011; Brooks 2013).

Design

Literature that falls under design is about how organisations handle or may handle mobile devices (Mourmant et al. 2013; Harris et al. 2012; Yang et al. 2013; Zahadat et al. 2015; Brodin 2015) and how to design a strategy and selection of strategy. Most articles about designing strategy for mobile devices focus on policies; get one and keep it up to date (Oliver 2012; Harris et al. 2012; Gatewood 2012; Montaña 2005; Yang et al. 2013). When it comes to setting the mobile device strategy, it is up to senior management (Ring 2013; Borrett 2013; Mooney et al. 2014) and it is important to have full support from all stakeholders (Silic & Back 2013).

Action

Apart from some articles that emphasise training (Gatewood 2012; Walters 2013; Markelj & Bernik 2012) we only found two articles dealing with the complete implementation (Brodin 2015;

Zahadat et al. 2015). Zahadat et al. (2015) focus on risk management and propose a way to address the security concerns connected to introduction of mobile devices.

The action part of the framework is the steps to take after selecting a strategy and deals with planning (allocating resources and conducting risk assessment for implementation), implementation (managing change) and evaluation.

In our literature review, we found a major gap when it comes to implementation of a mobile device strategy and as a result of that we conducted an empirical study to adjust the action part to practice.

Method

The empirical work is a pre-structured qualitative investigation (Jansen 2010) where the objective is 'to gather data on attitudes, opinions, impressions and beliefs of human subjects' (Jenkins 1985). Data analysis was conducted using thematic analysis (Braun & Clarke 2006).

13 semi-structured interviews were conducted with CIO, CSO, CFO, CSIO or head of IT in the food industry, manufacturing industry, defence industry, health care, municipality and consulting firms from various sectors (security, IT, management and logistics). The size of their organisations is from 50 to 15 000 employees. All interviews were recorded and transcribed and lasted approximately 45 minutes. The information provided by participants is kept strictly confidential. The coding was conducted using a qualitative data analysis software with codes from the framework, in section 2. The codes from the framework were then complemented with additional codes from trends detected in the qualitative material.

Mobile device strategy implementation in practice

The framework shown in section two suggested planning, implementation and evaluation in the action part, which is derived from the strategic management and ISO/IEC 27 000-series. We have looked at literature about mobile device implementation without finding much support for these sub-categories. While analysing our interviews we instead found three new categories; communication, training and adjustment.

Not planning, but communication

Although our theoretical model said planning, we found that communications is a more central thing in the implementation. A well communicated strategy is very important since the users have to understand the purpose and benefits of the strategy. One of the respondents talked a lot of the importance of making sure that all employees understand the risks and he ended the interview stating that technology will not help you.

"My main message is that it is not about technology but people. You cannot solve methodological problems with technology, you have to solve the method and it must be easy to do right. If you have a very complicated method where you have to start with two backward somersaults, then it would not be used. This is where it often goes wrong, it gets too complicated with too many things you must do. You cannot solve with technology; it must be solved with methods."

Another respondent testified that a policy without anchoring of the staff is useless. "*When we looked at how many actually using mobile email we found 5-600 tablets connected to our network. Even though our policy says no to tablets. So it has been just a paper policy, nothing else."*

How changes in policies are communicated differs a lot from organisation to organisation, but current policies can normally be found on the intranet. New or revised policies are communicated mostly by middle managers or as news on the intranet.

Out of the empirical work we found that communication is a key to success, not so much detailed planning for special activities as the theoretical model indicate.

Not implementation, but training

Although it is not just about communication of a new strategy or policy, the employees also need to understand the core value of it and how they are expected to use their device to gain the most benefits and minimizing risks. One organisation with a lot of employees with low IT skills chose to hand out all devices just before the summer, so that everyone could learn how to use their device during the summer. When everyone was back from holiday the organisation officially introduced the device and taught how the device was supposed to be used to facilitate work. Another organisation introduced tablets to their sales unit together with education in both security and the device itself. "*When we introduced iPad we had people from my department there to educate."* The same tactic was used by another respondents' organisation during implementation of mobile devices, the user received their device and received training on the same day with follow-up sessions to make sure that even persons with low IT skills know how to benefit from their new device.

What type of training users gets differs between organisations, five of the respondents said that their organisation provide training in both the device and security, two in only the device, four in only security and two introduced mobile devices without any training program at all. One respondent pointed out that you cannot just provide some training and think everyone will do as you told them. The users must gain something to embrace the new device in a way that is expected from the organisation. *"…because it's not just education. Here is a tool, and this is an education. They do not care at all, there must also be "what's in it for me". Then all of a sudden we are talking about the change in approach."*

In some cases, the training is done on a regular basis, mostly with a focus on security. Usually the reason behind it are demands of customer or certification organisations. "*We are certified to ISO 27001, not the whole company, but some parts, and it is my responsibility to ensure that we really can this and comply with it. And then we implement programs that everyone should have undergone so that you know what is expected of you. But that does not happen every year, the idea is to do it every five years and in between we got introduction with new employees. We are trying to find ways on how to measure and control this so that you can find deviations."*

Only two did not arrange any kind of training connected to the mobile devices.

Having a subtitle in action called implementation could be confusing since most of the things in action is about implementation. Training on the other hand is an important task that needs to be highlighted and performed.

Not evaluation, but adjustment

Our theoretical model highlights the importance of evaluation, but in our empirical study only four did an evaluation after the implementation. Some did a proof of concept, before the implementation, which were evaluated. Even where there is no formal evaluation some of the respondents felt like they evaluated it by discussions in different forums. "*Yes, maybe we have done this to my unit, we have planning meetings every week and often we have discussions and evaluations of how they use mobile devices. Both the security perspective, practical perspective and support perspective. So I would say that we do frequently."* That could be a way to evaluate, a problem with evaluation is in some case how to conduct the evaluation.

"But just how to evaluate how employees follows a policy. I do not know exactly how to put in such a control mechanism. What I can control is when we have done an education, and have it online on the web can I control how many completed the course and you can put controls on control issues on how well people understand these questions." Since it is so hard to evaluate it is more common to with follow-ups, informal discussions and topic on the agenda at management meetings than a full evaluation and analysis again after the strategy is implemented. Or as one respondent expressed it: "*We have a strategy in place and I think it works quite well. We have not done any proper evaluation, but we discuss the topic from time to time and make adjustments to strategy or people."*

Evaluation is important, but it is not something that is done in general. More common are small, informal evaluations that lead to some adjustment which is then communicated to all employees.

The process

The original Johnson and Scholes model (Johnson & Scholes 1993; Johnson et al. 2008) presents a model which is iterative to the extent that you are intended to go back and forth between the phases. Most of the security literature implies a more linear process - create a policy and then implement it.

Our empirical studies of practice usually reveal processes best described as punctuated equilibrium: an infrequent major strategy/policy development with additional smaller adjustments when needed, with regular training and communication.

"*... but where we notice that there is a problem, many make a mistake or in a way that is not good or if many are beginning to get to me with issues, several questions about the same thing. We see that there is a need to structure the details and make a statement to clarify things.*"

Improved framework

The framework in section two is theoretical and based on standards and well known literature. In literature, there is a gap when it comes to the implementation of mobile device strategies, in this study we have looked at implementation in practice to reduce that gap and with the new insight, we are able to improve the framework.

Our empirical study showed that the steps that organisations take are:

- Training – To increase security awareness, and to gain more benefits from the use of the device itself.
- Communication – To ensure that everyone in the organisation is aware of what the new strategy entails.
- Adjustment – When ambiguities or deficiencies appears in the strategy, adjustments are made.

This gives us the framework in figure 2, were Analysis and Design remain the same as in the original framework. After the initial work with analysis and design the work move into an iterative process where the strategy is communicated and training are arranged. When problems, uncertainties or need for improvement arises adjustments to the strategy are made and communicated. When major changes occur, for instance new mobile devices that not fit in the current strategy or a change in the organisations overall strategy, the process goes back to analysis again.

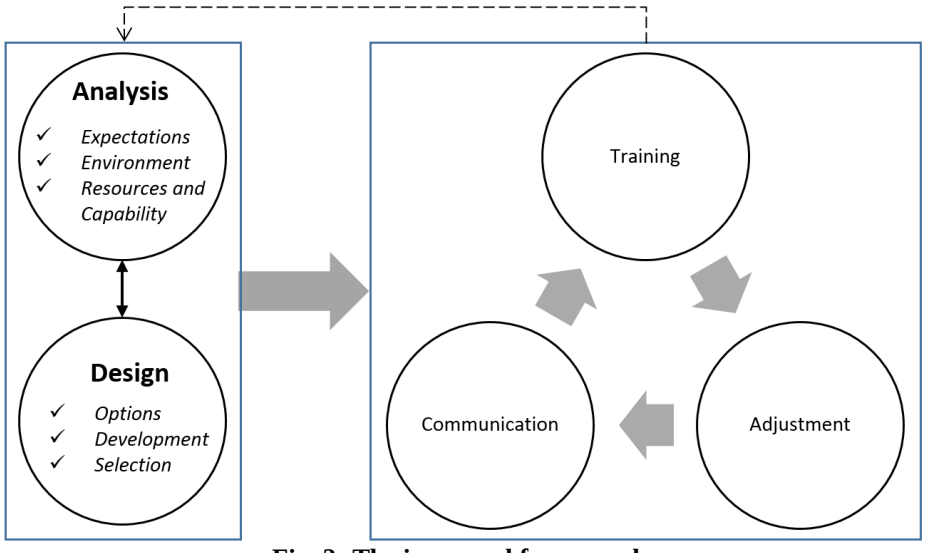

Fig. 2. The improved framework.

Discussion and conclusions

Literature tends to focus on policies and the importance of creating them and keeping them up to date. However, many of the respondents in this study do not have a policy for mobile devices, although they do have a successful strategy. In many cases it seems to be more important to work

with the culture and to educate and communicate. Of course there are policies in the organisation, but they are often short and more general. It is well known from the literature that employees seldom read, understand and follow policies and with that in mind it seems to be a good plan to focus on the humans instead of writing a document if you really want a change.

In our empirical study, we found that the most important steps to take when implementing a mobile device strategy are communication and training. You need to communicate your strategy to all employees and make sure that they understand. However, people understand in different ways and paces and they do tend to forget. That is why the communication needs to be supported with training and this is not just a one-time happening.

There are some limitations in our study; all interviews were conducted within organisations in Sweden, although some of the respondents are responsible for the organisation in all Europe. Further we only conducted 13 interviews, we can see a trend but not make any general conclusions. Future work should investigate if this trend can be applied in other countries and more organisations. This updated framework may help researchers and practitioners to understand the important steps to take when implementing a new strategy for mobile devices.

Résumé

Les pays de l'Afrique du Nord ont été touchés par trois crises : la crise financière mondiale, la crise alimentaire mondiale, et la crise de la dette de la zone euro. Dans ce contexte de volatilité des prix énergétiques et agricoles et des incertitudes de l'évolution du changement climatique, la capacité de ces pays à assurer leur sécurité alimentaire constitue de plus en plus un enjeu stratégique prioritaire. A cet égard, l'objectif de ce papier consiste à souligner l'importance économique de l'agriculture dans la lutte contre la faim. Les résultats dégagés à partir d'un modèle à effets fixes montrent l'impact positif et significatif de la valeur ajoutée agricole sur la sécurité alimentaire de cette région.

Mots clés : Sécurité alimentaire, secteur agricole, Afrique du Nord, modèle à effets fixes.

Abstract :

The North African countries have been affected by three crises: the global financial crisis, the world food crisis, and the Euro zone debt crisis. In this context of the volatility of the energy and agricultural prices and the uncertainties about the evolution of the climate change, the ability of these countries to ensure their food security is increasingly becoming a crucial strategic challenge. In this respect, the target of this paper is to emphasize the economic importance of agriculture in the struggle against hunger. The results achieved on the basis of a fixed effect model show the positive and significant impact of the agricultural added value on the food security of this region.

Keywords: food security, agricultural sector, North Africa, family farming, fixed effect model.

« La terre n'est pas un don de nos parents. Ce sont nos enfants qui nous la prêtent » [Maxime Amérindienne]

Introduction

Sous l'effet de la crise financière et alimentaire de 2007-2008 et dans le contexte du printemps arabe, et d'une Afrique du Nord en plein bouleversement sociopolitique, la population de cette région devient, de plus en plus, menacée par la sous-alimentation. A ce propos, nous essayerons de présenter une revue de la littérature théorique relative à l'importance du secteur agricole chez les physiocrates et chez les économistes contemporains. Sur le plan empirique, nous nous restreindrons, ensuite, à l'économétrie des données de panel, sur une période qui s'étale de 2000 à 2010. A cet égard, il est désormais intéressant de vérifier empiriquement les conclusions théoriques qui ressortent de ce papier, et de vérifier la corrélation entre l'agriculture et la sécurité alimentaire en Afrique du Nord.

1- Revue de littérature théorique

« Manger du pain ou n'en pas manger n'est pas une affaire de goût, de caprice ni de luxe, c'est une nécessité de tous les siècles et de tous les âges » [Galiani (1770)]. En effet, la nourriture est l'un des besoins humains primaires les plus fondamentaux. C'est un besoin journalier de survie. C'est pourquoi, la question alimentaire a occupé une place privilégiée dans les grands courants économiques depuis le XVI ème siècle (la période mercantiliste), jusqu'au XXI ème siècle [Turki Abdelhedi (2015), p.202-203].

Au contraire des mercantilistes et des classiques qui considéraient le travail comme l'unique source d'enrichissement, les physiocrates au XVIII ème siècle avec Quesnay ont largement démontré que la terre était la première source de richesse, et ont plaidé pour l'intensification [Rastoin et al (2005), p.1709-1716]. En effet, ces derniers prétendaient que les biens de subsistance avaient une certaine particularité, non plus à cause de leur satisfaction d'un besoin vital, mais, plutôt car ces biens étaient une fontaine de richesse et de prospérité, vu qu'ils découlaient de la seule activité productive qui est l'agriculture. Certes, celui qui sème une graine récolte plusieurs d'autres ; c'est ce que confirma Quesnay, F. [1756-1767] : « Que la terre est l'unique source des richesses et que c'est l'agriculture qui les multiplie »[1]. Parallèlement, Riqueti, V., et al [1758] énoncèrent aussi que « l'agriculture est la seule profession véritablement approuvée et chérie de la nature ; c'est la seule pour laquelle elle daigne travailler des mois entiers en récompense de quelques jours de labeur de sa part »[2].

Pour ces économistes, la spécificité des vivres réside donc dans leur provenance, qui est un créateur de richesse, et non car ils remplissent un besoin nutritionnel. Dans la même veine, De Nemours, S.D., [1764] parle de « richesses renaissantes ». En effet, le secteur agricole est ainsi analysé comme une génération, et non une simple addition de richesses, que multiplie la terre nourricière et qui s'assimile à un véritable don gratuit de la nature [Clément (2000)].

Ces derniers se basaient alors sur les dons offerts par la nature, qui pourraient enrichir tout un peuple s'il profitait bien de ces cadeaux naturels. En fait, « la mise en valeur des ressources naturelles, en premier lieu dans le cadre d'une activité agricole, est au cœur de leurs préoccupations. Seule l'agriculture est créatrice de richesses »[3]. Olivier, T. **[**2009] en déduisit la dépendance du système économique envers la nature. Ceci amène à constater que l'école physiocratique considérait les biens agricoles comme une simple marchandise pour multiplier et amplifier les fortunes [Olivier (2009), p.274)].

L'importance du secteur agricole est analysée non seulement chez les physiocrates, mais aussi chez les économistes contemporains. Après l'indépendance de leurs pays, et en se basant sur les économies développées, plusieurs auteurs ont considéré l'industrialisation comme l'unique source du développement [Alpine et al (1993), p.153]. Néanmoins, le choix de ce secteur s'est avéré, par la suite, erroné ; et beaucoup pays en développement ont dû donc se replier sur l'agriculture pour leur survie économique [Farvaque (2005), p.38-51]. Dans ce sens, Irz, X. et al [2006] stipulent que l'agriculture est le moteur de l'économie. De même, Pouch, T. [2002] a mentionné, lors de son examen des définitions de la politique agricole, que «l'agriculture ne serait pas un secteur comme un autre. Il n'y aurait pas une seule mission pour une politique agricole, …car elle est impliquée non seulement dans la fourniture à un coût raisonnable pour la collectivité de l'alimentation, …, mais elle s'accompagne aussi d'une gestion implicite et/ou explicite du territoire et de la répartition géographique des populations rurales, …, elle contribue aussi à l'équilibre environnemental et au bien-être sanitaire des hommes»[4]. En effet, les investissements dans le secteur agricole et dans les zones rurales des pays en voie de développement sont, certainement, nécessaires pour augmenter la production agricole et créer de l'emploi, qui sont des facteurs clés pour réduire la pauvreté

[4] POUCH T. [2002], « L'agriculture entre théorie et histoire ou qu'est-ce qu'une politique agricole », *Économie Appliquée*, Vol.4, n° 1, mars 2002, p.24.

[HRC (2009)].Plusieurs auteurs stipulent que l'augmentation des revenus agricoles réduit plus efficacement la pauvreté que l'augmentation des revenus non agricoles [Cervantes-Godoy et al (2010) ; BM (2008) ; Bresciani et al (2007), p.232; Christiaensen et al (2007) ; Ravallion et al (2007)], car la majorité des pauvres habitent dans des zones rurales et leur alimentation dépend du secteur agricole.

Saidi [2011] soutient que la production agricole vivrière et l'agriculture familiale jouent un rôle crucial dans la lutte contre l'insécurité alimentaire. D'une part, ce type d'agriculture permet de satisfaire les besoins de subsistance et de générer des revenus à la population pauvre. D'autre part, cette petite agriculture contribue à une alimentation saine et équilibrée qui se caractérise par la faible utilisation des produits chimiques, ainsi à la conservation de la biodiversité agricole, et à l'utilisation durable des ressources naturelles.

A cet égard, la revalorisation de l'agriculture s'est appuyée sur l'agriculture familiale ; cette dernière s'avère comme un élément indispensable, comme l'indiquent plusieurs experts [FAO (2009), p.1; BM (2008)], pour résoudre la problématique de la faim. En effet, cette forme d'organisation a été un déterminant essentiel dans le succès du secteur agricole des pays développés. Dans le même genre d'idées, plusieurs auteurs contemporains soutiennent que l'agriculture dominée par les petites exploitations, et non l'agriculture à grande échelle, représente actuellement la colonne vertébrale de la sécurité alimentaire des pays en voie de développement [Chappel et al (2011), p.3-26; Horlings et al (2011), p.441-452 ; et Tscharnke et al (2012), p.53-59]. Dans le même contexte, la FAO [2015] affirme que l'agriculture à petite échelle pourra aussi contribuer tant à la promotion de l'emploi rural, qu'à la croissance économique inclusive, notamment des ménages les plus vulnérables.

La production agricole est non seulement une source essentielle pour l'approvisionnement alimentaire, mais, elle est aussi la principale source de revenu pour la plupart des ménages [FAO (2003)]. Toutefois, ces derniers sont très vulnérables aux mauvaises conditions climatiques et aux catastrophes naturelles ; au point qu'ils risquent de tomber en insécurité alimentaire saisonnière dans les périodes de soudure [BM (2008)]. De même, la diminution de l'approvisionnement alimentaire et la perte des moyens de subsistance peuvent aussi être provoquées par les investissements fonciers à grande échelle [Sen et al (1990) ; FIAN(2010)].

Néanmoins, dans le continent africain, les investissements dans le secteur agricole ont été relativement faibles par rapport à ceux des autres régions. Tandis que les gouvernements africains ont dépensé, en moyenne, 4,5 % de leur budget total sur l'agriculture, les gouvernements asiatiques ont dépensé le double [Fan et al, (2008)]. Au cours des quatre dernières décennies, la croissance de la production nationale n'a pas pu suivre l'accroissement démographique. Delà, les importations alimentaires africaines ont augmenté [Degraaff et al, (2011), p195-213]. A cet égard, Chabane et al [2013] affirment que les gouvernements des pays les moins avancés (PMA) devraient redonner à l'agriculture sa place entière. En effet, le rôle central joué par le secteur agricole, en tant que vecteur efficient pour la préservation des ressources, et en tant qu'élément fondamental pour lutter contre la pauvreté, la faim et le réchauffement climatique, prouve la nécessité d'une politique de développement plaçant le secteur agricole en première priorité.

En Afrique du Nord, la production agricole demeure insuffisante. Des pays comme le Maroc, l'Algérie et l'Égypte sont, en effet, des zones de « haute sismicité alimentaire », au regard des déséquilibres chroniques entre la production agricole et les besoins des populations [Herview et al (2009), p.9-52]. Cette insuffisance peut être le résultat de l'évolution d'une combinaison de facteurs. En fait, Zolin [2010] met l'accent sur l'accès inéquitable, des agriculteurs des zones rurales et marginales, aux intrants. Cet accès ne pourra que diminuer la production agricole. D'autres facteurs portent sur le désintérêt des travailleurs vis-à-vis de la profession agricole, métier difficile, souvent peu adapté à une vie moderne et à ses loisirs, déconsidéré sur le plan social. De même, l'urbanisation rampante qui capte les meilleurs sols à vocation agricole peut également être cause d'abandon [Padilla (2008), p.231-249]. En outre, l'accélération du processus d'industrialisation a abouti aussi à un recul des superficies cultivables et a amené à négliger les politiques agricoles, surtout que l'aide publique au développement s'est concentrée sur d'autres secteurs que l'agriculture, et que la vision de l'industrialisation en économie ouverte a négligé le secteur agricole [Vindel (2011), p.73].

2- Situation agricole en Afrique du Nord

L'irrigation est un facteur clé de la productivité agricole. Toutefois, une grande partie des territoires du nord de l'Afrique se situe dans des zones semi-arides, voire arides. En effet, le désert occupe une partie non négligente du territoire tunisien et algérien. De ce fait, ces pays sont à moins de 10 pour cent de terres irriguées. D'ailleurs, le changement climatique menace fortement l'agriculture pluviale qui prédomine dans la plupart des pays de la région. Quant à l'Egypte, elle pratique une agriculture à 100 pour cent irriguée grâce au fleuve le plus long du monde [Rastoin et al (2012), p.24].

Les terres arables ne représentent qu'une faible part de la totalité de la superficie surtout en Tunisie, en Algérie, et en Egypte où ce taux est inférieur à 3,5 pour cent [Blanc (2009), p.181].

Face aux contraintes hydriques et foncières (la pression démographique), l'agriculture intensive est concentrée tout au long du Nil en Egypte et dans les régions côtières au Maghreb. Toutefois, ce type d'agriculture fondé sur l'utilisation massive d'intrants chimiques (engrais, phytosanitaires, énergie, semence) est de plus en plus remis en cause [Bony (2011)]. Il devra être substitué par un autre type d'agriculture viable et durable qui vise à réconcilier l'agriculture et l'environnement favorable à la biosphère.

Les céréales représentent la part la plus importante des importations des produits de base dans la région étudiée (de 35 à 40 pour cent) [CIHEAM (2009), p.23]. La dépendance en céréales s'explique par l'importance stratégique de ces produits agricoles dans la sécurité alimentaire et particulièrement le blé (blé tendre et blé dur) qui est à la base de la diète alimentaire des pays d'Afrique du Nord.

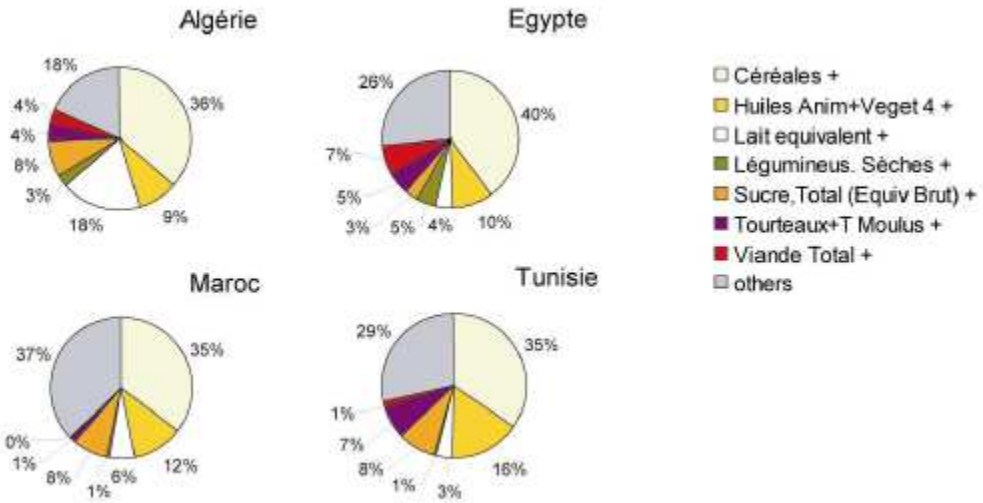

Figure 1 : Répartition en valeur (US dollars) des principaux produits agricoles d'importation (moyenne 2002 – 2006)

Source : Elaboré par le CIHEAM-IAMM à partir des données de FAOSTAT, 2008

La part des exportations alimentaires en pourcentage de la production agricole est presque de 30 pour cent en Tunisie, 20 pour cent au Maroc. Alors qu'en Algérie, elle ne représente qu'une part négligeable (entre 0.8% et 2,3%) au cours de la période 2005-2010 [CEA-AN (2012), p.23] du fait que l'économie algérienne est fortement dominée par le secteur des hydrocarbures. En 2006, les exportations agricoles constituent huit pour cent du commerce extérieur égyptien [Lerin et al (2009), p37].

3- Validation empirique

Dans notre analyse économétrique, nous avons utilisé les données de panel pour déterminer les facteurs de la sécurité alimentaire et répondre à la question principale de ce manuscrit, à savoir si l'impact

de l'agriculture et la priorité de ce secteur stimulent la sécurité alimentaire en Afrique du Nord, et ce en examinant les déterminants de la sous-alimentation dans cette région.

La variable dépendante est l'insécurité alimentaire ; elle est mesurée par la prévalence de la sous-alimentation en pourcentage de la population totale [5](IA) ; cet indicateur de la faim est un indicateur traditionnel de la FAO, il est adopté aussi en tant qu'indicateur officiel du premier Objectif du Millénaire pour le Développement (OMD1, cible 1C). Les variables indépendantes sont au nombre de quatre, à savoir : la valeur ajoutée agricole[6] (AGR_PIB), qui est mesurée par la valeur ajoutée de l'agriculture en pourcentage du PIB. Le pouvoir d'achat (PA), il est mesuré par le revenu national brut en parité du pouvoir d'achat[7]. La croissance démographique (CROISS_DEMOG), qui est mesurée par le taux d'accroissement démographique[8]. La balance commerciale alimentaire (XM) dont l'exportation et l'importation alimentaires, sont mesurées en pourcentage de l'exportation et de l'importation de marchandises[9].

Avant de passer aux données de panel, il est intéressant de faire l'analyse descriptive de nos variables pour avoir des résultats préliminaires sur les variables étudiées, et ce en calculant les statistiques descriptives usuelles (moyennes, écarts types, minimums et maximums), et en calculant aussi les corrélations qui peuvent exister entre les variables explicatives, afin de détecter le risque de multicolinéarité.

Tableau 1: Les statistiques descriptives du modèle

Variable	Mean	Std. Dev.	Min	Max
ia	4.465909	.6826566	4	6.2
Crois-demog	1.339083	.348494	.5901647	1.868865
pa	5509.318	1772.82	2520	8960
xm	-6.045396	12.00713	-28.00338	11.79852
Agr-pib	12.30397	3.378441	6.915571	17.2918

La moyenne de la prévalence de la sous-alimentation en Afrique du Nord est environ de 4,5 pour cent. Les pays les plus vulnérables sont le Maroc (5,6%) et l'Algérie (4,5%). Le signe de la moyenne de (XM) est négatif car les importations alimentaires excèdent les exportations alimentaires dans la période allant de 2000 à 2010. Malgré que l'agriculture ait un rôle majeur dans la réduction du chômage, de la pauvreté, et dans le développement économique, la moyenne de la valeur ajoutée agricole (exprimée en pourcentage du PIB) dans cette sous-région n'est que 12,3 pour cent cette dernière décennie. Elle est de l'ordre de 15 pour cent en Egypte, 15,7 pour cent au Maroc, 9, 8 pour cent en Tunisie et 8,6 pour cent en Algérie [Turki Abdelhedi (2015), p.202-203].

Les données de Panel disposent deux dimensions : une dimension individuelle et une dimension temporelle. Cette double dimension représente un grand avantage acquis par les données de panel, que ce soit par rapport aux données en séries temporelles, ou aux données en coupes transversales. En effet, si les données en séries temporelles ou chronologiques permettent d'étudier l'évolution des relations dans le temps, elles ne permettent pas de contrôler l'hétérogénéité entre les individus. A l'inverse, les données en coupes transversales permettent d'analyser l'hétérogénéité entre les individus, mais elles ne peuvent pas tenir compte des comportements dynamiques, puisque la dimension temporelle est exclue du champ d'analyse [Goaied et al, 2012, p16-18].

Après la vérification des tests (test de spécification de Fisher, test de Hausman, test de normalité des résidus, test d'hétéroscédasticité) et la correction de l'autocorrélation, nous retenons, le modèle à effets fixes suivant :

[5]Source : FAOSTAT, 2012.
[6] Source : WDI, 2012.
[7] Source : BM, 2012.
[8] Source : WDI, 2012.
[9] Source : WDI, 2012.

Tableau 2 : Résultats d'estimation du modèle

Variable dépendante : IA	Coefficients
Agr-PIB	-0,067*
PA	-0,001***
XM	0,004ns
Croiss-Demog	-0,404ns
Constante	-13,845
R^2	0,581

EF : Estimation par Effets Fixes

*, *** : Significatif au seuil de 10% et 1%

ns : non significatif

Les résultats obtenus montrent nettement que la variable d'intérêt de ce modèle (la valeur ajoutée agricole en pourcentage du PIB : AGR_PIB) contribue positivement à la sécurité alimentaire de l'Afrique du Nord. Conformément, à Padilla [2008], l'impact positif de l'agriculture sur la sécurité alimentaire est vérifié aussi pour toute la Méditerranée. En effet, ce dernier souligne que les variables les plus influentes sur la sécurité alimentaire, sont le niveau de la production agricole et alimentaire et la qualité de cette production, la pauvreté relative, les inégalités et l'identité culturelle alimentaire. De même, le principal message du rapport de la Banque Mondiale sur le développement dans le monde, est que le premier des objectifs du millénaire pour le développement (OMD 1), visant à réduire de moitié la proportion de la population vivant dans l'extrême pauvreté et souffrant de la faim chronique, est principalement déterminé par le développement de l'agriculture [BM (2008)]. Ainsi que Fan et al [2008] ont signalé que les hausses des prix alimentaires de 2007-2008 ont contribué à la conscience publique des facteurs de la faim, et par la suite, à de nouveaux engagements internationaux dans l'investissement agricole dans les pays en voie de développement. Évidement, le développement agricole est crucial pour réduire la faim et la pauvreté des zones rurales [Diao et al (2007)]. Ceci indique clairement la conformité de nos résultats empiriques à la littérature théorique.

Conclusion

En guise de synthèse de cette recherche, il est intéressant de proposer des recommandations pouvant favoriser la sécurité alimentaire en Afrique du Nord. A cet effet, il est nécessaire d'orienter, de plus en plus, les dépenses publiques vers le secteur agricole et le développement rural, en mettant l'accent sur l'amélioration de la gouvernance des collectivités rurales de façon à dynamiser l'économie rurale. L'action doit être au niveau du développement de l'agriculture sur les exploitations familiales agricoles. D'ailleurs, les Nations Unies ont déclaré l'année 2014 comme l'année internationale de l'agriculture familiale (AIAF). Le principe de base de cette proclamation est d'accorder à l'agriculture familiale l'importance qu'elle mérite, car elle a un rôle déterminant non seulement dans l'amélioration de la sécurité alimentaire, mais aussi dans la réduction de la pauvreté et de l'exode rural, la diminution du chômage, et la gestion des ressources naturelles… Parallèlement, le Fonds International de Développement Agricole (FIDA) estime que les agriculteurs familiaux ont la possibilité et l'obligation d'être les précurseurs du changement de l'agriculture mondiale. Selon l'Oxfam [2002], la productivité agricole vietnamienne a augmenté de cinq pour cent en moyenne dans les années 90, et grâce à l'agriculture familiale, le Vietnam s'est transformé d'un petit importateur de riz, à un deuxième plus grand exportateur mondial dans une quinzaine d'années. Cette transformation a engendré une diminution remarquable de son taux de malnutrition. De même, l'exemple de la Chine est un exemple révélateur. Ce pays a aussi réussi à éradiquer la malnutrition en mettant la volonté sur le soutien de sa population agricole rurale, et en mettant en œuvre des politiques de soutien à la communauté rurale et agricole. Cependant, pour le cas africain, le gouvernement concentre l'investissement agricole dans les grandes exploitations, au détriment des petits agriculteurs et des consommateurs pauvres, contrairement aux pays qui ont réussi dans leur lutte contre la faim et la malnutrition par l'adaptation de tels programmes, comme la Bolsa Familia (c'est un programme social brésilien d'aide financière qui associait éducation, santé primaire et investissement dans l'agriculture familiale[10]).

[10] Il s'agit d'une allocation en espèces aux ménages pauvres.

L'agriculture présente un instrument crucial pour garantir le droit à la nourriture en Afrique du Nord. Il est désormais, donc, de la considérer comme un secteur à part entière et d'intensifier les programmes de soutien dans ce secteur. Les décideurs politiques devront donc privilégier les programmes de soutien qui permettent aux agriculteurs familiaux de gérer leurs terres d'une manière durable. Pour y parvenir, ils devront mettre l'accent sur les facteurs qui expliquent l'agriculture familiale : faciliter l'accès au marché, aux terres (l'exemption des terres à vocation agricoles louées des droits d'enregistrement et des impôts sur les revenus), rééchelonner les dettes des agriculteurs, promouvoir la recherche dans les thèmes de la sécurité alimentaire et du développement agricole durable, créer une interaction entre chercheurs et importants acteurs dans le domaine pratique, ainsi que les sensibiliser du rôle majeur des petits agriculteurs familiaux dans le développement agricole, et notamment les femmes.

De même, les gouvernements devraient agir à court, à moyen et à long terme, soit par le soutien et les aides pour l'acquisition des semences et des engrais, soit par le biais des programmes de protection sociale tels que l'augmentation des revenus appuyés par des interventions directes en nutrition et des investissements en santé et en eau. A cet effet, il faudrait effectivement concevoir, et de manière adéquate, les mécanismes d'interventions d'urgence, car si ces interventions se perpétuent et se répètent, elles risquent de perturber la production alimentaire intérieure. Certes, ces mesures immédiates devraient être suivies par d'autres mesures à moyen et à long terme qui tentent d'atteindre l'accroissement durable de la production agricole nationale afin de diminuer la dépendance alimentaire envers l'étranger et alléger certaines dépenses publiques (les subventions, les mesures conjoncturelles…). A cet effet, il faut surmonter les obstacles structurels qui défavorisent le secteur pour faciliter l'implication du secteur privé.

Il est aussi important de privilégier l'éradication de la pauvreté, car le lien entre la pauvreté et l'insécurité alimentaire est très complexe et peut être résumé dans un cercle vicieux. Il est donc préférable d'intégrer les stratégies de lutte contre la pauvreté aux politiques de sécurité alimentaire afin de réduire la pauvreté et la faim qui sont étroitement liées.

Malgré que le secteur agricole constitue un pilier fondamental de l'activité économique de la région étudiée, les dépenses publiques accordées à l'agriculture demeurent encore au dessous de l'engagement pris en 2003 à Maputo d'affecter 10 pour cent du budget national au secteur agricole[11]. Dans le même contexte, les investissements dans la recherche agricole ne dépassent pas 0.6 pour cent du PIB agricole (sauf au Maroc : 0.9 pour cent). D'une manière générale, les dispositifs de formation, d'encadrement et d'innovation demeurent encore faibles dans ce secteur. Rastoin [2011] stipule que le projet de Chaire Unesco « Alimentations du monde » (ADM) contribuera à accumuler et à faire progresser la connaissance par la science et la technologie dans un domaine « l'alimentation », où les savoirs scientifiques restent lacunaires. De tels projets, comme l'ADM, pourront sensibiliser, les gouvernants, les enseignants, les directeurs du secteur public et privé, les étudiants, les chercheurs et même les citoyens, de l'importance de la formation sur le thème de l'alimentation et de l'agriculture. Dans le même contexte, il serait intéressant dans le cadre des travaux futurs d'inciter à insérer dans chaque université, dans chaque unité de recherche, dans chaque laboratoire de recherche, une discipline traitant les thèmes de l'alimentation durable, et qu'elle soit aussi élaborée par des enseignants-chercheurs pluridisciplinaires.

La coordination entre les pays de la région est aussi une mesure importante, car on peut réussir seule, mais réussir ensemble est beaucoup plus efficace. Il convient donc de disposer des mécanismes solides de coordination, de mise en œuvre et de surveillance de la sécurité en créant un fond de garantie des prix pour un marché commun. Ce genre de garantie des prix va assurer la stabilité des prix à la production, en créant une réserve régionale. Il faut aussi augmenter le taux de pénétration de l'assurance « multirisque climatique » auprès des agriculteurs, renforcer les capacités et les outils nécessaires de gestion de risque lié aux catastrophes, et créer des banques alimentaires et des infrastructures adéquates, des filières de distribution alimentaire pour réduire les pertes alimentaires.

Enfin, nous soulignons l'importance d'une volonté politique parce que si la volonté politique n'existe pas, rien ne pourrait être entrepris.

[11] En 2009 et 2010, le financement public accordé au secteur agricole est de l'ordre de 4,5 pour cent du budget global en Tunisie et de 4 pour cent au Maroc (CEA-AN, 2012).

Une politique commune agricole maghrébine est une opportunité pour ces pays s'ils mettent les moyens suffisants à la lutte contre la corruption et l'application des droits fondamentaux.

Customer Relationship Management (CRM) in Small Brick-And-Mortar Retail Shops: Back to the Essence of CRM

Petra Solarová, Institute of Technology and Business in České Budějovice, Department of Tourism and Marketing, Okružní 517/10, 370 01 České Budějovice,Czech Republic, e-mail: petrasolarova@gmail.com

Roman Švec, Institute of Technology and Business in České Budějovice, Department of Tourism and Marketing, Okružní 517/10, 370 01 České Budějovice, Czech Republic, e-mail: svec.roman78@gmail.com

Abstract

The essential thoughts of CRM are sometimes hidden or not fully obvious. Hence, the aim of this paper is to explore the reality of CRM in the form that was mainly typical in the past, i.e. customer relationship management without any software tools, only by using the knowledge in the entrepreneur's head and his/her skills how to build and develop personal relationships with his/her customers. In order to catch the characteristic traits of this approach to CRM, own observation in the chosen small specialised brick-and-mortar retail shops and also semi-structured interviews with entrepreneurs or relevant internal workers of these chosen shops were used. The obtained data were analysed, compared and synthesised. Subsequently, the typical traits of CRM in the chosen small specialised shops were identified: (1) no anonymity, (2) sales interview as a kind of social contact, (3) sales interview as an opportunity to share experience. These traits can be considered as a competitive advantage. It is advisable to keep in mind the fundamental thought of CRM: the genuine personal and friendly approach.

Keywords: customer relationship management; CRM; B2C; retail

1 Introduction

This section briefly presents the definitions of the basic terms mentioned in the title of the paper (i.e. 'customer relationship management' and 'retail').

After this section, there are presented the aim and the corresponding methods that lead to fulfilling the specified aim. Besides this, the authors' approach to the choice of the topic is also explained here.

The next section with results contains the obtained empirical data in a compressed form, including the synthesis of findings.

1.1 Customer relationship management (CRM)

Customer relationship management (CRM) is a part of the relationship marketing – according to Palmatier (2008, p. 7), these "terms are sometimes used interchangeably". Egan (2012) notes relationship marketing is even used as a synonym for terms like direct marketing, relevance marketing or individual marketing etc. – his approach is really broad.

However, there is a difference between these terms. While relationship marketing focuses on relationships with all relevant interest groups of the particular company, the concept of CRM deals only with the customers (customers can be considered as one of the company's interest groups).

Palmatier (2008, p. 7) explains the connection between CRM and relationship marketing in this way: CRM is "the managerially relevant application of relationship marketing". The single words in the abbreviation can be explained as follows: customers (= C) is in the centre of thinking and their relationships (= R) with the company should be managed (= M) (Wessling, 2003).

1.2 Essential thoughts of CRM

CRM is mainly connected with topics like customer loyalty, loyalty programmes/schemes or special software solutions. There are plenty of papers which deal just with these themes, e.g. Slabá (2015) focuses on customer loyalty and factors that influence it, Pícha, Skořepa and Navrátil (2013) deal with factors on loyalty to a particular store, Bednarz (2012) deals with loyalty programmes, Harrigan, Soutar, Choudhury and Lowe (2015) describe the connection of CRM with social media technology etc. Indisputably, such approaches to CRM are useful and their narrow specialisation is welcomed.

However, the essential thoughts of CRM are sometimes hidden or not fully obvious, especially in the retail sector. It was common in the past that the retailer (salesperson) knows his/her customers very well and was able to recommend products appropriately. Such retailer relied on the knowledge in his/her own head – he/she did not have any special software tools that are very common in the today's business practice. He/she simply used the personal approach to the customers and he/she managed to obtain important and useful information through sales interviews with his/her customers. In this sense, the term 'Tante-Emma-Laden' is very common in the German literature (Knoche, 2013).

In connection with it, Román (2014) emphasises salesperson's active listening. It is possible to claim that such active listening can be likened to the today's B2B area where the relationships are more personal than it is in B2C area. Generally, sometimes the kind and hospitable employees of any service provider are enough to have these same clients willing to come again (Švec et al., 2012).

Developing interpersonal bonds between employees and customers in selling contexts can increase sales and positive perceptions of the employees and the store (Jacob et al., 2011). If the salesperson is able to build and develop a meaningful relationship with the customers, it can happen easily what Reynolds and Arnold (2000) describe: the loyalty to the salesperson can "spill over" into the loyalty to the store. According to Pascu, Milea and Nedea (2015), loyal customers are the valuable competitive advantage of every company – customers can be likened to the source of the company's growth.

1.3 Retail sector

Kotler and Keller (2012, p. 447) define retailing as follows: it "includes all the activities in selling goods or services directly to final consumers for personal, nonbusiness use". It is just the 'nonbusiness use' what is the crucial aspect of retailing. Retailing belongs to the area of B2C.

Basically, retailing can be realised either as store-based, or as non-store based (particularly web-based) (Berman and Evans, 2010).

For purposes of this paper, the store-based retailing (realised in brick-and-mortar shops) is important, especially 'specialty stores' that Berman and Evans (2010, p. 132) describe as shops with "very narrow

width and extensive depth of assortment". According to Mulačová, Mulač et al. (2013), the offer of these specialised shops usually contains non-food and the typical feature is the high knowledgeable staff.

2 Aim and methods

The aim of this paper arises from the introduction – i.e. to explore essential thoughts of CRM in the today's world. Based on the authors' experience, these thoughts seem to be hidden, not fully obvious or expressed only implicitly, especially in the retail sector.

Results from searching in scientific databases support the importance of the presented topic. Table 1 shows how many results can be obtained if there are six combinations of keywords (written as lower-case letters), connected with basic boolean operator "AND":

- relationships marketing AND b2b,
- relationship marketing AND b2c,
- personal relationships AND b2b,
- personal relationships AND b2c,
- crm AND b2b,
- crm AND b2c.

Table 1: Results from scientific databases Web of Science (WoS) and Scopus

Keywords	B2B	B2C
Relationship marketing	447 (WoS), 296 (Scopus)	118 (WoS), 75 (Scopus)
Personal relationships	27 (WoS), 31 (Scopus)	15 (WoS), 18 (Scopus)
CRM	53 (WoS), 70 (Scopus)	31 (WoS), 45 (Scopus)
Total	924	302

Source: Own processing.

Table 1 shows there are more results connected with the area of B2B, in comparison with the area B2C. It indicates there are substantial research opportunities in the area of B2C. In other words, the attention has been predominantly paid to the area of B2B in the context of relationship marketing, personal relationships and CRM (own searching in databases Web of Science and Scopus was carried out in February 2016).

The topic about personal relationships with customers in the retail sector has been still underestimated; e.g. Ellis and Beatty (1995) express the same idea. Specifically, these authors focus on customer relationships with retail salespeople (salesperson in the shops).

Hence, the aim of this paper is to explore the reality of customer relationship management in the today's world – customer relationship management in the form that was mainly typical in the past, i.e. customer relationship management without any software tools, only by using the knowledge in the entrepreneur's head and his/her skills how to build and develop personal relationships with his/her customers.

In order to catch the characteristic traits of this approach to CRM, own observation in four chosen small specialised brick-and-mortar retail shops located in the Czech Republic and also semi-structured

interviews with entrepreneurs or relevant internal workers (= hereafter simply referred to as respondents) of the chosen retail shops were used. The research was carried out in January and February 2016.

The reason for using observation was the fact that this research method is able to considerably enrich the findings. However, this method is sometimes neglected (Saunders, Lewis and Thornhill, 2009). Using semi-structured interviews allowed to modify the prepared questions from interview to interview so the specifics of respondents were respected (Saunders, Lewis and Thornhill, 2009). The obtained data were analysed, compared and synthesised.

The choice of particular shops was based on the authors' judgement – there was an effort to find such shops where it was a certain probability to capture the basic essential characteristic traits of the above described approach to CRM: It was also derived from the authors' present experience that this phenomenon is mostly obvious in small specialised shops with hobby products.

3 Results

Table 2 summarises brief characteristics about the chosen brick-and-mortar shops where observation and semi-structured interviews were carried out.

Table 2: Chosen shops for purposes of the research

Case	Brief characteristic
1	▪ A small specialised shop with hobby products (products for modellers) ▪ The respondent was the entrepreneur and the only worker in the shop ▪ Combination of the over-the-counter sale and self-service
2	▪ A small specialised shop with hobby products (electronics for both amateur and professional users) ▪ The respondent was the entrepreneur, there were another three workers who serve to incoming customers ▪ Only the over-the-counter sale
3	▪ A small specialised shop with hobby products (products for amateurs and professional fishing) ▪ The respondent was one of two workers who serve to incoming customers ▪ Combination of the over-the-counter sale and self-service
4	▪ A small specialised shop with hobby products (product for modellers) ▪ The respondent was one worker who serves to incoming customers ▪ Only the over-the-counter sale

Source: Own processing.

All the shops were located in one city in the Czech Republic. They were specialised and in two cases, there was only the entrepreneur, without any additional workers.

3.1 Observation in brick-and-mortar specialised shops

This section contains description of findings, obtained through the own observation in the chosen specialised brick-and-mortar shops (introduced in the above mentioned Table 1).

Case 1

As the research interview with the respondent was realised during opening hours in his shop, there was an opportunity to observe customers and their behaviour (the research semi-structured interview was always interrupted when a customer entered the shop and the respondent started to pay attention to the incoming customer).

The sales interviews between the respondent and the single customers concerned not only requirements on the needed goods, but the interviews contained also personal topics and experience in goods that the customer had bought last time. It was obvious the respondent knows his customers relatively well. It arose from the observation, customers like speaking about their personal experience (in the context of the offered goods) and the respondent likes this kind of discussion.

Case 2

The observation was realised separately (the research semi-structure interview with the entrepreneur was not realised during opening hours directly in the shop).

It was obvious the salesperson (who was different from the entrepreneur) knows his customers very well, sometimes it was clear they know each other relatively deeply. The act of buying was not primal very often, it looked like that the primal reason was sharing the experience.

Among customers, there were both end users (i.e. consumers) and people who buy for the needs of their companies. Nevertheless, the approach to them was the same – there was not any noticeable difference.

The sales interview was very informal; e.g. one customer came in order to buy a product and the subsequent interview was gradually diverted from the particular product to the completely different topic (but this topic did not concern personal matters at all; it was a professional discussion – there was still a certain link to the offered products). The salesperson was knowledgeable, pleasant and helpful.

Case 3

The research semi-structured interview was realised during opening hours in the shop and one worker served to the incoming customers.

There was a customer who was interested in fishing poles. He started to consult with the salesperson (different from the respondent) which one would be suitable for his needs. The interview was highly specialised because the salesperson was knowledgeable and able to give advice.

If there was not any customer in the shop, one of the workers stood at the entrance to the shop and said hello to him known people. It was obvious he is not anonymous in the city where the shop is located.

Case 4

The conditions for research were identical with the case 1: the research semi-structure interview with the respondent was realised during opening hours in the shop and so there was an opportunity to observe customers and their behaviour (the research semi-structured interview was always interrupted when a customer entered the shop and the respondent started to pay attention to the incoming customer).

It was obvious the respondent knows her customers relatively well because she used the very informal address “guys” (in order to address a small group of customers who knew each other evidently).

One of the incoming customers wanted a product that was not available in the shop. The respondent apologised for it and recommended to visit a competitive shop. But the customer asked for ordering it – the customer did not want to go to the competitive shop.

3.2 Semi-structured interviews with entrepreneurs

This section contains description of findings, obtained through semi-structured interviews with entrepreneurs or workers in the chosen specialised brick-and-mortar shops (introduced in the above mentioned Table 2).

Case 1

According to the words of the respondent, he does not consider himself as a salesperson. Naturally, he sells the goods, but through these words he wanted to express he prefers personal relationships with his customers.

Such personal relationships have an influence on the customers' willingness to accept the respondent's prices, although customers could easily order almost all products on the internet and in this way, they could reach better prices. However, customers are used to coming to the shop for advice, for discussion and finally, in order to buy.

From respondent's words, it was evident he attaches great value to the personal interviews with customers. Since his range of the offered goods is specialised (= products for modellers), the respondent educates himself continuously, and then he is able to discuss with the customers and to create space for sharing experience.

Case 2

According to the words of the respondent, there is a group of customers who are simply used to coming to the shop. As a reason, the respondent mentioned that it is usual to order a particular product what a customer demands just now. Customers know, it is functioning in this way, and are loyal, despite the same action of ordering something could be arranged in a competitive shop if a customer comes and makes a request for the particular product. Nevertheless, customers come to the respondent's shop and order the requested products here. It can be explained through the fact that customers grew fond of respondents' workers, they have good relationships with them and so they come to them.

Such relationships with customers can be considered as a result of the particularity (in the sense of the offered range of goods). The offered products are highly specific – they are designed for amateur and professional users of electronics. In the city, where this shop is located, there is not any interest association that would unite these users so this shop functions as an interest association. It means it unites people of a certain "community" – people who like things relating to electronics.

It is typical that a customer who has come for the first time and has been unknown, will be familiar after several visits. According to the respondent's words, it is a pleasure to advise and to check up own knowledge.

Case 3

According to the words of the worker in the shop, incoming customers usually want to ask for a piece of advice – e.g. they say what they have read somewhere and they would like to hear the workers' opinion on it because the worker is considered to be a specialist in the field of fishery. A similar situation is, if customers want to gain specific pieces of advice in the field of fishery.

Another kind of relationship with customers has the following characteristics: customers come in order to brag about their success in the fishery – they bring photos and thank for good advice. It means there is a space for discussing the use of the purchased products.

Case 4

The research semi-structured interview was brief in this case. The respondent admitted the customers want to speak about their private issues, so the respondent feels like their confidant. This is a proof the relationships between customers and the respondent have personal essence.

3.3 Synthesis of findings

This section contains a synthesis of the above presented findings and their integration into a broader context.

Fig. 1 shows the summary of characteristic traits of CRM in the chosen small specialised shops with the traditional personal approach:

- Firstly, customers are not anonymous.
  Workers in the chosen shops know their customers relatively well.
- Secondly, sales interview is considered as a kind of social contact.
  In this sense, a shop is considered to be a place where people meet. Personal or private matters of the particular customers become a part of sales interview.
- Thirdly, sales interview is an opportunity to share specific experience, regarding the offered products.
  Entrepreneurs or workers in the chosen shops educate themselves in order to be able to create space for sharing experience and to discuss about the offered products. It means, they seek for news actively and follow trends in the particular area.

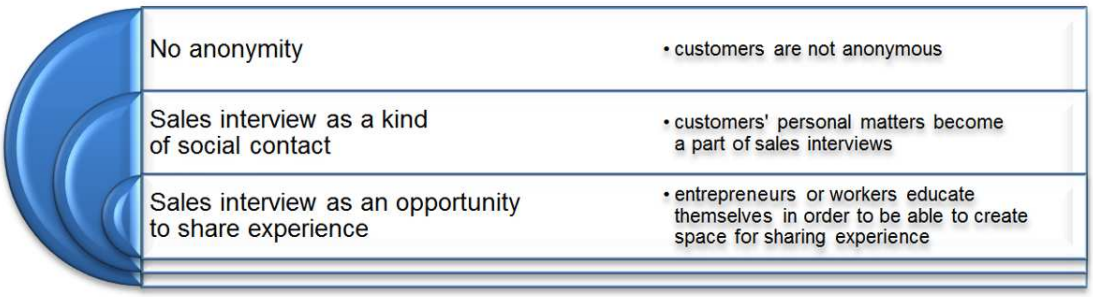

Fig. 1: Characteristic traits of CRM in small shops with the traditional personal approach
Source: Own processing.

Ellis and Beatty (1995, p. 597) connect the idea of customer relationships with the environment of considerable competition between retailers and claim that "creating a competitive advantage is essential to survival of retailing firms". In the context of this paper, extraordinary relationships with the customers can be considered as a competitive advantage. Palmatier (2008) notes that the importance of relationship marketing has grown in the environment of the increasing competition – companies try to look for other distinctions than it is a price.

The approach to the competition shops is interesting: in two of the above presented cases, the customer obtained advice to go to the competition. It indicates the entrepreneur is not afraid of the competition because he/she is probably sure about the loyalty of his/her customers.

Without any doubt, the excellent relationships with customers mean a great benefit for every company (for instance, see case 2: customers grew fond of respondents' workers, they have good relationships with them and so they come to them). However, it is necessary to admit one thing: although customers may have good relationships with workers/salesperson in the shop, their loyalty to the shop itself can be only minimal. In this sense, Guo (2012) deals with the possible risk of customer loyalty when this loyalty is aimed at salespersons.

Through personal sales interviews with customers, important knowledge can be obtained and this knowledge can be further used for development of company's business activities. For instance, according to Tišlerová (2012), it is possible to obtain exploitable knowledge just from customers.

4 Conclusion

The essential thoughts of CRM are sometimes hidden or not fully obvious, especially in the retail sector. Hence, the aim of this paper was to explore the reality of CRM in the form that was typical mainly in the past, i.e. customer relationship management without any software tools, only by using the knowledge in the entrepreneur's head and his/her skills how to build and develop personal relationships with his/her customers.

In order to catch the characteristic traits of this approach to CRM, own observation in four chosen small specialised brick-and-mortar retail shops located in the Czech Republic and also semi-structured interviews with entrepreneurs or relevant internal workers of the chosen retail shops were used.

The characteristic traits of CRM in the chosen small specialised shops with the traditional personal approach can be summarised as follows: (1) customers are not anonymous, (2) sales interview is considered as a kind of social contact, (3) sales interview is an opportunity to share specific experience, regarding the offered products. These traits can be considered as a competitive advantage, as a factor that is able to distinguish individual retailers. It is advisable to keep in mind the fundamental thought of CRM: the genuine personal and friendly approach.

Abstract

Information and Communication Technologies (ICT) have dramatically changed the provision of tourism destination information. That is the reason it is becoming critical for destination and businesses in the tourism industry to have a strong online presence. In order to achieve this goal, the proper use of online channels is crucial. The goal becomes more difficult when considering different behavior of web page users regarding their age cohort. The article focuses on Generation Y web page users and their evaluation of selected official town destinations´ web pages (5 main tourism attractions in Central Europe). The focus is on visual appeal of the websites. With help of a mix of qualitative research approaches, including an eye tracking study followed by questionnaires, the authors evaluate those web pages from different points of view and try to compare the results. The authors also found several conclusions for positioning of various visual contents of the web page.

Keywords: Destination, Evaluation, Generation Y, Tourism, Visual Appeal, Web page, Website.

Introduction

Any description of the ICT development path must of necessity start from an analysis of the concepts of Web 1.0, 2.0 and the possibilities of future improvements currently grouped under the expression Web 3.0. (Minazzi, 2014) Websites are a major channel to broaden companies´ reach and market share. Thus making websites visually appealing has become of great importance to organizations and also destination. Internet connection is important for this new possibility of new distribution channel. European Commission monitors so called DESI (Digital Economy and Society Index). The findings show that Member States have made progress in areas such as connectivity and digital skills, as well as in public services. There is highlighted the problem with a lack of high-speed internet coverage, cross-border e-government and difficulties in shopping and selling across borders. The leaders of DESI ranking are Denmark, the Netherlands, Sweden and Finland. The fastest growing countries are the Netherlands, Estonia, Germany, Malta, Austria and Portugal (European Commission, 2016b). In DESI 2016, the Czech Republic ranks 17th out of the 28 EU Member States. More people take-up subscriptions to fast broadband and mobile broadband. According Figure 1 Czech citizens have a good level of digital skills and as a result, they engage in a wide variety of online activities. Czech internet users are quite keen on online shopping. Czech Business use digital technologies to improve their efficiency and to access wider markets. But the Czech Republic has not progressed significantly compared to last year so it falls into the cluster of Falling behind countries whose score is below the EU average and which grew slower. (European Commission, 2016a)

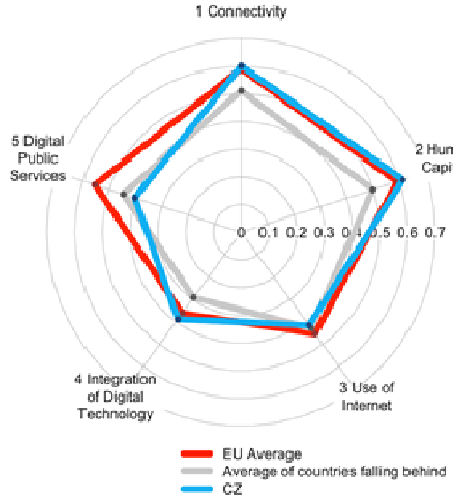

Figure 1: Digital Scoreboard of the Czech Republic
Source: European Commission, 2016a.

Websites are the important interfaces in HCI (Human-Computer Interaction). (Wang et al., 2014). Information on a websites is typically communicated through its perceptual elements, such as text and images. Making web pages more usable is important to organizations because a good web design can keep users from moving away from the website. While users may move away from a website for technical reasons, content reasons and form reasons. (Djamasbi et al., 2010) Visual hierarchy and its creating through arrangement of proper perceptual elements can guide users´ viewing the page. Internet penetration and use of internet are most important factor for use website in communication. World internet population and internet penetration you can see in Figure 2.

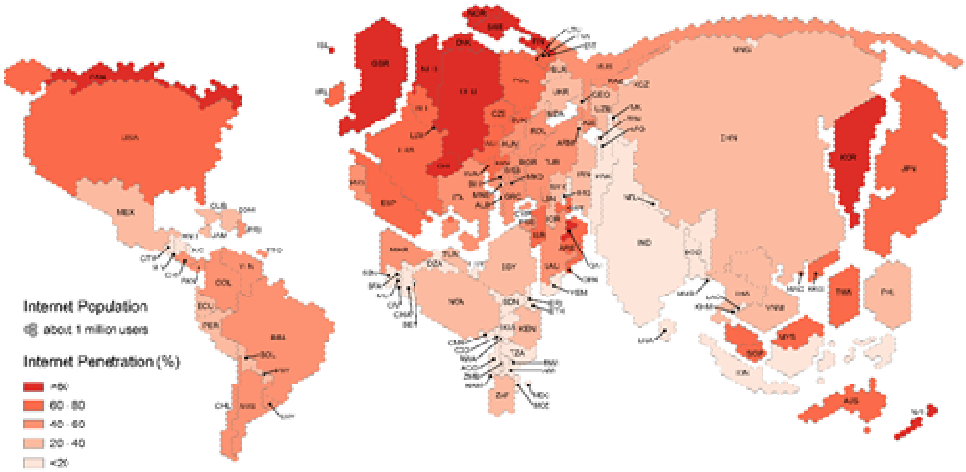

Figure 2: World internet population and penetration
Source: Graham & Sabata, 2013

Generation Y and its behavior

First authors dealing with age cohorts were Karl Mannheim and Paul Kecskemeti (1952). Each generation is socio-culture closed groups of people, mainly selected by year of birth and common behavior. They are defined with help of demography, culture, use of printed or no printed information, market survey and survey of members (Pendergast, 2010). This topic is very interesting in these days in all fields of research. The same situation is in tourism research especially because there is a multi-generation customer. (Leask, Fyall, Barron, 2011). It is important to know the specifics of each generation for providers of tourism services for attract of tourists. Generation cohorts are can´t use for all population. There are some differences between nation, history evolution, politics opinions etc. We focused on young people from Generation Y and their perception of information on the internet pages. First problem of research was to define member of Generation Y. Some authors defined Generation Y quite differently. Solka, Jackson and Lee (2011) deals with people born between 1977-1996, Perdegast (2010) 1982-2002, Neubome and Kerwin (1999 in Leask, Fyall & Barron, 2011) 1979-1994 or Solka, Jackson and Lee (2011) 1981-1995. This generation differs from other in many characteristics. One of them is shopping behavior (Bakewell& Michell, 2006). They use technological progress like e-commerce and use of ITC. Generation Y is one of the first generations to have technology and the internet from a very early age – they are significantly more likely than older internet users to create blogs, download music, instant message and play online games (Dajmasbi et al., 2010). They want to be always connected. They use internet in many activities, which cover sending text message, information capturing, using of social network, podcasting and reading and writing blogs (Nusair, Parsa & Cobanoglu, 2011) People of this generation are more oriented on games. They expect that their job will be a fun and they are focused on success. (Broadbridge, Mawell & Ogden, 2009). Kah and Lee (2014) deal with decision process in tourism and they conclude it in five phases: (1) recognition of needs or desire to travel, (2) searching of information, (3) evaluation of alternatives, (4) finale decision and (5) real purchase. Nowadays tourism businesses can influence phase of searching of travel information. In a networked environment such as the web, all organizations in the tourism sector are facing a dynamic and innovative industry. Multichannel Communication solution can help capture visitors´ attention. Integration of multiple platforms (e.g. blogs, social media) has been identified as a major issues, and specifically multi-channel communication (e.g. Facebook, Twitter, Instagram) and advertisement (Booking, Trivago, Uber) on social web platforms (Fenzel et al., 2016). Generation Y is very important segment for its strong buying power. In 2020 it will be the major segment in tourism consumption. They will also tend to share their unique travel experience (Cohen, Prayag & Moital, 2014). One way to capture visitors´ attention is web page. It has to be professional and with clear focus on target segment. Current generation of young people keeps only 10 % of text information. Two or three times more it keeps in graphic form. They grew up with computer games, TV and multimedia presentation. It is good to use humor in some message in web site presentation (Kipnis & Childs, 2004). Djamasbi et al. (2010) and Hao et al. (2016) found out that there are some different characteristics important for Generation Y in website layout (main large picture, pictures of celebrities, search feature and little text).

Research Methodology

The main goal of this paper is evaluate the visual appeal of official web pages of town destinations. Partial objective is to find specific problems of examined web pages. The selected official web pages of town destinations are five covering main tourism attractions in Central European countries.

Table 1: Cities and websites researched

City	Country	Website Researched
Prague	Czech Republic	http://www.prague.eu/en
Bratislava	Slovakia	http://www.visitbratislava.com

Vienna	Austria	http://www.wien.info/en
Kraków	Poland	http://www.krakow.pl/english/
Würzburg	Germany	http://www.wuerzburg.de/en/

Source: own, 2016

Authors used a mix of qualitative research methods to evaluate the web pages. Result of each method is a ranking of the web pages, also over all ranking has been computed.

Firstly the authors evaluated the main factors of the websites and mobile applications. The methodology is based on Luna-Nevarez and Hyman (2012) approach, but some of the observed factors had been adjusted to correspond with the main goal of the article and its focus to Generation Y. The results (including evaluated factors) are presented in Table 2.

Then an exploratory eye tracking study has been conducted. Eye tracking is a king of neuro-physiological method that can record the eye-movement metrics to objectively reflect participants´ attentions and emotions during the experiment. It is not valid method itself. So this study combined questionnaire (self-report method) and eye-tracking (neuro-physiological method) to measure the user affability. (Wang et al., 2014b) Eye-tracking is widely used in HCI studies since eye movement can reflect the visual search mode, which is important in revealing the cognitive processing mechanism. There are several advantages to using eye-tracking to examine website design. It removes the subjectivity of self-reporting data and it allows tracking users´ reactions without affecting other stimuli and can show which parts of the page captured participants´ attention most (Wang et al., 2014a).

An eye tracking study is conducted using the pages of town destinations. Participant's eye movement is tracked while browsing these pages, providing evidence of what attracts their attentions. Eye tracking for this type of research is used in many studies (Djamasbi, Siegel & Tullis, 2010; Wang et al., 2014a; Bergstrom, Olmsted-Hawala & Jans, 2013; Chu, Paul & Ruel, 2009; Yang & Huang, 2013). Eye-tracking was used by Djamasbi et al. (2011) specifically on Generation Y and its use site experience. Other way to research attention of webpages is eye-tracking measures the size of pupil. Pupils react to certain types of images, colors and designs (Loyola et al., 2015).

The authors used various methods for comparing the destination web pages during the eye tracking using Mangold Vision Eye Tracking solution (VT3 mini eye tracker with desktop computer) study, which has been combined with questionnaire:

- the respondents were monitored while trying to find following information: name of the destination, picture of the destination, language selection option, official contact information and search tool (also the time needed to find the information was monitored);
- the respondents ranked the web pages from the best to the worst according to their observation;
- the respondents evaluated how easy they found name, picture, language, contact information and search tool (1-10 scale, 10 = easy, 1 = difficult);
- the respondents rated the website, its purpose and answered how likely they would recommend the web site (1-10, 10 = best, 1 = worst);
- the pupils diameters were measured during the entire eye tracking process.

First two information (name of destination, picture) had been used for familiarizing with the web page and gathering initial vision focus of the respondents.

For this explorative study we have interviewed 6 Non-European visitors of the Czech Republic. All respondents were male Brazilian university students of Engineering, born between 1991 and 1994 (thus all were members of Generation Y), their native language was Portuguese, but their English language skills were at least at advanced level. Their average family monthly income was about 12 000 USD. This is also the limitation of the conducted research. The research was conducted in January and February

2016 at the University of West Bohemia, Faculty of Economics, Department of Marketing, Trade and Services in its eye tracking lab.

Results

Following results had been achieved. In Table 2 the main factors of destination web pages and mobile applications are compared.

Table 2: Evaluation of main factors of the web pages and mobile applications – 01/2016

Measured variable		Prague	Bratislava	Vienna	Kraków	Würzburg
Website						
Primary focus	Informative/cultural (1 pt.)	3	2	2	2	3

Rank		**3**	**5**	**2**	**4**	**1**

Source: own research, 2016

The main differences discovered in Table 2 are the number of social media used for promotion and the primary focus of the website, leading the rank is Würzburg followed by Vienna and Prague, respectively.

As illustration, the first impressions of selected web pages (Vienna, Würzburg) from participants at the eye tracking study are shown in Figure 3. It is clear to see that the interviewees did concentrate on

pictures (photos and also pictures in logo of the destination Würzburg), which confirms the considerations about Generation Y web page consumption.

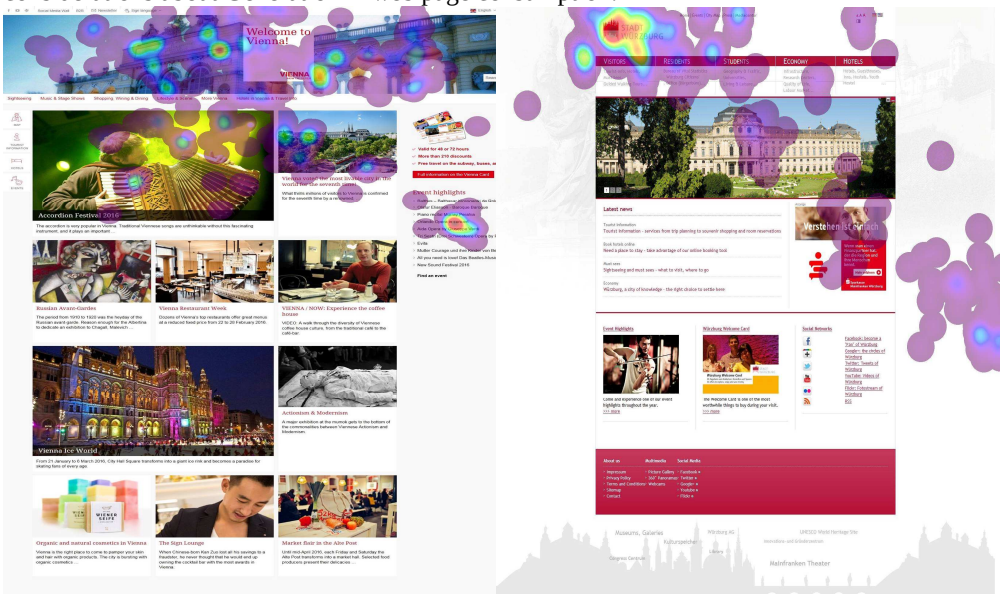

Figure 3: Heat maps for Vienna and Würzburg – first impressions
Source: own research, 2016

For further evaluations, the participants were asked to find the position of five key factors (city name or logo, city picture, language selection option, contact information (or link) and searching tool) on the destination web pages, so some conclusions could be derived. The first two key factors were there to grab participant attention and to get them familiar with the webpage, the other three key factors were fully measured and analyzed.

Some interesting results from eye tracking are showed in the Table 3. The average times to fix the defined information (language selection, contact information, search tool) are presented. Krakow, followed by Bratislava and Würzburg seem to have the best web pages in terms of visual overview. Würzburg has definitely the best position of the search tool. On the other hand the Prague´s website did not rank very well. This might be impact of non-standard layout of the webpage, where the most searched items were predominantly in a centered menu located in lower part of the web page, which is not usual.

Table 3: Time for fixing object

Criteria	Prague	Bratislava	Vienna	Kraków	Würzburg
Language selection	2,4500	1,6933	0,7567	0,4083	0,6325
Contact information	7,0680	5,3580	N/A	5,6280	7,4650
Contact - time to scroll down	5,4720	4,9700	N/A	4,5180	4,4850
Searching tool	1,1983	1,2350	2,3683	1,3967	1,0067
Average	**4,0471**	**3,3141**	**1,5625**	**2,9878**	**3,3973**
Rank	**4**	**2**	**5 ***	**1**	**3**

** contact information were missing, so the web page was ranked as fifth*
Source: own research, 2016

Notes were taken during researching about location of the information on the websites, see Table 4. Those notes might explain the times to fix those objects, which are presented in Table 3.

Table 4: Position of information on the webpage

Criteria	Prague	Bratislava	Vienna	Kraków	Würzburg
Language Selection	Right side in middle line, flag with "en" just under a picture.	Very upper right side part, selection of abbreviations.	Very upper right side part, flag with "english".	Very upper right side part, just flags.	Very upper right side part, just flags
Contact Information	Lower part of webpage - need to scroll; within more menus.	Lower part of webpage - need to scroll; almost alone standing link.	Not available.	Lower part of webpage - need to scroll; within more menus (less than Prague, Würzburg).	Lower part of webpage - need to scroll; within more menus.
Searching Tool	Right on the middle part, just a search button under a picture.	Right on the upper part, just a search button, less visible.	Right on the upper part, search line inside of background picture, out of menus.	Right on the upper part, just a search button.	Middle on the upper part of the webpage (big search line).

Source: own research, 2016

Table 5 shows the participants' rating of the individual key factors (how easy were they to find). Those are presented as overall average for each web page and respondent. The results should correlate with the results in Table 3. The highest variety showed the evaluation of the Kraków web page. In general, the results of objective measurement (time to fix the object according the eye tracker data) does not really correspond with the subjective evaluation of respondents. Obvious objective trouble with searching the proper information in case of Prague web page, were not captured in subjective evaluation.

The interviewees also ranked the webpages according to their overall perception; the results are presented in Table 6. This data are similar to the data in Table 5. In this case we can state, that the respondents subjective evaluations – regarding overall webpage evaluation and evaluation of its individual factors – are almost corresponding.

Table 5: Average based on participant ratings

ID	Prague	Bratislava	Vienna	Kraków	Würzburg
1	8,8750	8,0000	8,5000	9,3750	9,5000
2	8,5000	8,0000	8,2500	8,3750	8,8750
3	8,6875	8,8750	7,6250	7,8750	8,8750
4	9,7500	9,7500	8,5000	9,7500	9,7500
5	9,5000	8,8750	8,6250	7,8750	8,3750
6	8,0000	8,0000	7,5000	7,1250	8,0000
Average	**8,8854**	**8,5833**	**8,1667**	**8,3958**	**8,8958**
Rank	**2**	**3**	**5**	**4**	**1**

Table 7: Pupils (left-eye) diameter in mm (the bigger the better)

ID	Prague	Bratislava	Vienna	Kraków	Würzburg
1	2,7902	2,7155	2,4870	2,9052	2,5524
2	3,0368	2,9935	2,9272	3,0127	2,9233
3	3,4083	3,3922	3,5005	3,4799	3,3302
4	4,0976	3,8316	3,8402	3,7217	3,5482
5	4,1074	4,0306	4,3436	3,9660	3,8650
6	5,2529	5,2255	5,2479	5,5009	5,0087
Average size	**3,7822**	**3,6981**	**3,7244**	**3,7644**	**3,5380**
Rank	**1**	**4**	**3**	**2**	**5**

Source: own research, 2016

The authors also evaluated the pupil diameters of respondents for each observed web page. The results are showed in Table 7. Using the assumption that the more the participants' likes the web page the bigger is the pupil diameter. Clearly the web pages of Prague and Kraków were the most liked. Prague´s web page works extensively with pictures and isn´t designed in a common way. Its web page has been also evaluated high from the respondents. This is to see in Table 8, which presents the summary of different evaluation methodologies used in this article.

Table 8: Summary of different methodologies results

Method		Prague	Bratislava	Vienna	Kraków	Würzburg
Main factors of web page and mobile application	Table 2	3	5	2	4	1
Times for fixing an object	Table 3	4	2	5	1	3
Average based on participant ratings	Table 5	2	3	5	4	1
Participants' website ranking	Table 6	1	3	5	4	2
Pupil diameters	Table 7	1	4	3	2	5
Average		2,20	3,40	4,00	3,00	2,40

Source: own research, 2016

Average ratings of Prague and Würzburg official destination web pages were the highest ones. Nevertheless, both of them did not mark high in all used methods of evaluation.

Discussion

In this study, the researchers evaluated a small group of destination web pages through five different methodologies that allowed them to derive different conclusions. Although some substantial differences in between the web sites lay-outs and structures, none of them was outstandingly above the average. Even though this study was made on an online topic (website) which by definition is unseasonable and knowing that the big efforts made by tourism managers is to prepare for next season, many people look for information off-season to prepare (perhaps getting some early-bird discounts) and plan ahead their holidays. For a tourism manager, being able to provide Generation Y the information they need all year round, so they can make a proper choice on destination and planning is advantageous.

Table 9: Evaluation on information location

Criteria	Evaluation
Language Selection	Clearly faster times when located on the very upper right side part with flags (graphic).
Contact Information	Long search times due to the need of scrolling; the more menus the slower.
Searching Tool	Clearly Wurzburg positions best, then everything within a menu, no influence of graphic.

Source: own research, 2016

As we can see in this study, tourism marketing plays a big role on strategy. From using social media as a way to connect with potential tourists to a deep analysis on tourism behavior, the tourists look for fast, attention-grabbing, visually appealing and user friendly content. Websites that had these differentials were better evaluated as we can see a great composition in Prague's website.

During the study it was possible to see that the location of information on the website is important and as a conclusion from Table 4, Table 9 specifies the best rated location for the key factors analyzed.

But, Table 9 shows, that different methods used, deliver different (sometimes opposite) results. So for example, would we concern only at eye tracking data (times to fix information), the Prague´s web page would rank very low. Although, subjective evaluations and pupil diameter showed that this web page is ranked high. Bratislava´s web page which uses a lot of pictures and less texts (thus, parameters appealing to Generation Y), but ranks in the middle in most evaluations. So obviously, not only visual factors influence the web page evaluation from the Generation Y point of view, but further factors might need to be investigated.

Finally, the presented results don´t show clear recommendation on how a web page appealing to Generation Y should look like, nor does it show an appropriate evaluation method (some objective observations proofed subjective evaluations, but some did not). On the other hand even such small scale study with limited number of respondents showed interesting conclusions – see Table 9.

An FCA-Based Information Retrieval Algorithm using Prime Numbers

Mahran Farhat, Higher school of digital economy, University of Manouba, Tunisia, farhatmahran@gmail.com
Mohamed Mohsen Gammoudi, High Institute of Multimedia Arts of Manouba, University of Manouba, Tunisia, gammoudimomo@gmail.com

Abstract

Lattice-based information retrieval methods have the advantage of providing efficient results. However, the general process of such methods is based on a matching step between each concept of the lattice and the considered query in order to identify the most relevant concept. The matching step is based on the comparison of strings which reflects a relatively high run-time cost. This can be seen as a time-consuming task, mainly when dealing with large corpora. In fact, the complexity of a lattice may grow rapidly with the corpus size. To overcome this deficiency, we introduce a new method of lattice-based information retrieval using Formal Concept Analysis (FCA) and prime numbers, and we propose an algorithm, called *PNBLSearch*, to answer users' queries. We evaluate the reliability of the proposed method using a standard document collection. We have also compared the outcomes provided by our method with those provided by an existing lattice-based information retrieval algorithm proposed by Messai et al. (2006), called BR-Explorer. Experimental results showed that our method reached better results than the Br-Explorer algorithm.

Keywords: information retrieval, formal concept analysis, prime numbers, concept lattice.

Introduction

Information Retrieval (IR) deals with representing, storing, organizing and accessing documents. Sanderson and Croft (2012) mentioned that the key goal of an Information Retrieval System (IRS) is to retrieve information which might be useful or relevant to the user. However, with a large data size, IR systems face the problems of filtering and predicting which documents are relevant to user's information needs. Several studies Nauer and Toussaint (2009); Carpineto et al.(2004); Koester (2006); Carpineto and Romano (2000); Godin et al. (1995a) highlight the need of an appropriate document clustering method that retrieves and accesses information items in order to improve the performance of IRSs . In this case, IR has always been a major concern in Formal Concept Analysis (FCA) Wille (1992); Ganter and Wille (2012); Salton (1989); Safar et al. (2004); Carpineto and Romano (2000); Godin et al. (1995a). Most of the conducted studies dealt with FCA-based applications for the design of information retrieval systems as done by Nauer and Toussaint (2009); Carpineto et al. (2004); Koester (2006). This is motivated, on the one hand, by the obvious analogy that exists between object-attribute and document-term tables Messai et al. (2006). On the Other hand, it is motivated by the fact that a formal concept may be seen as a class of relevant documents for given queries Godin et al. (1995a). This provides a first way for FCA-based information retrieval applications, namely IR by querying Messai et al. (2006). Moreover, FCA allows us to model corpus content through a concept lattice. Lattice structures can be browsed and used for zooming into relevant parts Carpineto and Romano (2000). This provides a second way for FCA-based information retrieval applications, namely IR by navigation Messai et al. (2006).

Indeed, an FCA-based IR application has an interesting advantage which consists in a combination strategy of the two forms of IR using concept lattices (querying-based IR and browsing-based IR). Thanks to this combined strategy, users may submit their queries and get a list of relevant documents. Additional results can be identified by browsing a subpart of the lattice, which provides a synthetic view of the corpus content.

Several studies have proposed lattice-based information retrieval approaches Codocedo et al. (2012); Messai et al. (2006, 2005); Carpineto and Romano (2000); Godin et al. (1995a). A review of these studies shows that the general process of such methods is based on a matching step between each concept of the lattice and the considered user's query in order to identify the most relevant concept. This latter will be considered as a retrieval starting point to build a step-wise outcome by crossing the lattice. The matching step is based on the comparison of strings which reflects a relatively high run-time cost. Thus, this can be seen as a time-consuming task, mainly when dealing with large corpora. Indeed, the complexity of a lattice may grow rapidly with the corpus size. This implies that specialized techniques should be used to speed up the task of matching concepts to queries. To overcome this deficiency, we introduce a new method of lattice-based IR which uses Formal Concept Analysis (FCA) and prime numbers, and we propose an algorithm, called *PNBLSearch*, to answer users' queries. Specifically, we suggest using prime numbers to encode concepts' intents of the built lattice which would yield a new coded lattice. This choice is supported by the fact that the use of prime numbers makes comparison easier and, therefore, allows us to minimize run-time. In addition, we suggest an intermediate representation of the coded lattice as a ranked list of levels according to the cardinality of the concepts' intents. It aims at reducing the number of concepts to be handled which allows us to accelerate the retrieval process. It becomes then possible to answer users' queries in the shortest time by using both the coded lattice and the corresponding intermediate representation as index structures.

This paper is organized as follows. Section 2 presents our FCA-based information retrieval method. The last section is devoted to the conclusion and future work. Please note that because of lack of space, a research report containing more details regarding the state of the art, formal definitions of concepts used in our method, an illustrative example of our algorithm and experimental results can be downloaded from https://goo.gl/PLfhgM.

Design of the proposed method

Following the well-known FCA-based IR studies Carpineto and Romano (2000); Godin et al. (1995a), we start by modeling the corpus content through a formal context from which we calculate the associated concept lattice using the algorithm proposed by Godin et al. (1995b). Thereafter, we suggest using prime numbers to encode concepts' intents of the built lattice, which yields a new coded lattice. In addition, we suggest an intermediate representation, denoted by IRL, of the coded lattice as a ranked list of levels according to the cardinality of concepts' intents. It becomes then possible to answer the users' query in the shortest time by using both the coded lattice and the corresponding intermediate representation as index structures. In the following subsections, we illustrate the main phases of the proposed method.

An FCA-based indexing

Our aim in this subsection is to show how both the FCA approach and prime numbers can be used to formalize the corpus content. At first, we formulate the corpus content through a formal context $K = (D, T, R)$, where D is a set of documents, T is a set of keywords and R is a binary relation, $R \subseteq D \times T$ and $R(d_i, t_j)$ where $d_i \in D$ and $t_j \in T$ means that the document d_i is

indexed by the term t_j . Let us consider a formal context $K1 = (D1, T1, R1)$ describing a given corpus.

Table 1: Formal Context $K1 = (D1, T1, R1)$

	t1	t2	t3	t4	t5	t6
d1	0	1	1	1	1	1
d2	0	1	1	1	1	0
d3	0	1	1	1	1	0
d4	1	1	1	1	0	0
d5	0	0	0	1	1	0
d6	1	1	0	1	0	0
d7	1	1	0	0	0	0

Figure 1 show the corresponding concept lattice which has been built from the formal context $K1$. In order to answer a user's information need, query terms are usually mapped onto the lattice structure in order to identify the most relevant concept that shares more terms with the considered Codocedo et al. (2012); Messai et al. (2006). Obviously, this can be seen as a time-consuming task, mainly when dealing with a large set of concepts. To address this problem, we suggest using prime numbers to encode the intent of each concept of the built lattice. We assign to each keyword (attribute) a prime number, starting with the first prime number 2. As a result, the intent of each concept will be the product of the prime numbers associated with the owned attributes. Figure 2 shows the resulting coded lattice corresponding to the initial concept lattice shown in figure 1. Table 2 represents the set of keywords and the associated prime numbers.

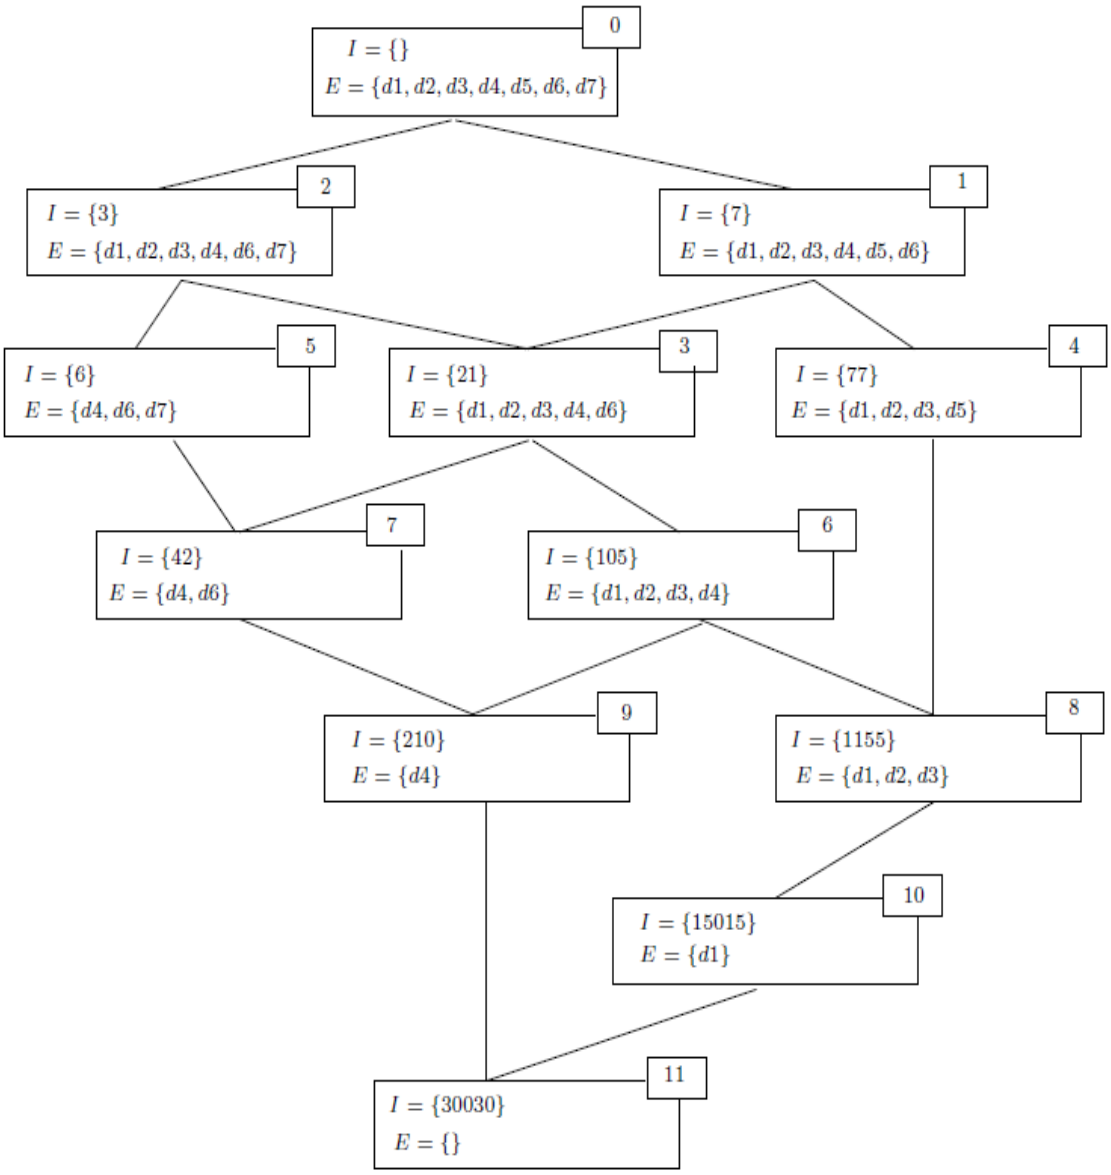

Fig 2. The coded lattice

Table 2: The coded keywords

t1	t2	t3	t4	t5	t6
2	3	5	7	11	13

Once the coded lattice is built, we suggest organizing the coded concept lattice in a sorted list of levels according to the cardinality of concepts' intents. Let us note that in a concept lattice, we can identify several cardinality levels due to the cardinality of concepts' intents. Inspired by the study of GAMMOUDI (2005), we suggest organizing the coded lattice as a ranked list of levels where each level regroups a set of concepts that share the same cardinality level. Each level is a triplet $(code, code - terms, Nodes)$ where $code$ is the cardinality level, $code - terms$ is the product of the prime numbers associated with the attributes (keywords) which constitute the intents of the corresponding concepts, and $Nodes$ is the set of concepts belonging to this level.

As an example, let us consider $C1 = (\{7\}, \{d5, d4, d6, d1, d2, d3\})$ and $C2 = (\{3\}, \{d4, d7, d6, d1, d2, d3\})$ two coded concepts of the coded lattice (see figure 2) which represent $C1 = (\{t4\}, \{d5, d4, d6, d1, d2, d3\})$ and $C2 = (\{t2\}, \{d4, d7, d6, d1, d2, d3\})$ two non-coded concepts of the initial lattice (see figure 1), respectively. Let us note that the coded concepts C1 and C2 share the same cardinality level; the corresponding non-coded concepts share the same intent cardinality (the intent of each concept contains only one attribute). Then, they belong to the same level with a cardinality level equal to 1. At this point, let us note that the intent of each non-coded concept is a subset of the overall set of attributes $\delta = \{t4, t7\}$, which is the union of the different intents of non-coded concepts. By encoding the attributes of the set δ using the corresponding prime numbers in Table 2, this latter will be $\delta = \{7 \times 3\} = \{21\}$. Thus, the intent of each coded concepts is encompassed by the coded overall set of attributes $\delta = \{21\}$. We call the coded overall set of attributes of each level a $code - terms$. Using such a set allows us to determine if the level encompasses or not a concept which shares terms with the considered query, without checking the whole set of the concepts. As a result, this level will be modeled as follows:

$$Level\ 1 = (1, 21, \{C2, C1\})$$

Figure 3 illustrates the ranked list of levels which have been derived from the coded lattice shown in figure 2.

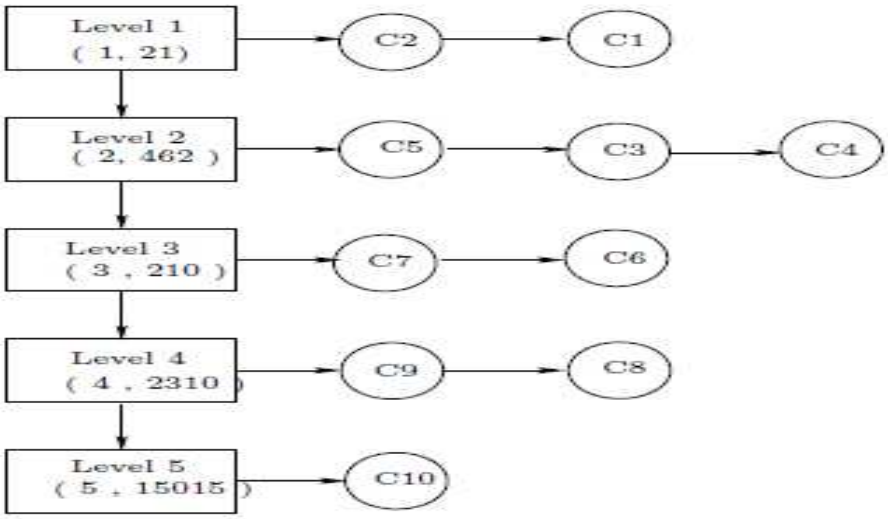

Fig 3. Intermediate Representation of Lattice

This way of representation aims at reducing the number of concepts to be handled which allows us to accelerate the retrieval process. In fact, for a given query, only concepts of the potential level will be handled in order to identify a relevant concept that encompasses the query term among its closed set of attributes. Once both the coded lattice and the corresponding *IRL* are built, we are ready to answer the user query.

Index querying

The proposed algorithm called *PNBLSearch* relies on the coded concept lattice and the corresponding *IRL* generated in the previous step. Our aim is to identify in the shortest time, the relevant objects that match the user's information need.

Let us consider a query *Q* which represents the user's information need. In order to answer the user's query, we suggest dividing the initial query in a set of elementary queries $Q = \{q_1, q_2, \ldots, q_n\}$ where each of them contains only one term of the initial query terms. Then, we suggest encoding each generated-elementary-query using the corresponding prime numbers in the Table 2 which yields a set of coded queries. For each resulting coded query, we sweep the *IRL* in order to first identify a potential level which covers the considered query. We consider a level *L* as a potential level for a given query q_i if and only if it encompasses the query term among its overall set of attributes called $coded - terms$ $(L.code - terms \cap q_i = q_i)$. Thereafter, we sweep the set of the concepts belonging to the potential level in order to identify a potential concept which covers the considered query. We consider a concept C as a potential concept for a query q_i if and only if it encompasses the query term among its closed set of attributes $(Int(C) \cap q_i = q_i)$.

Let us note that in mathematics, more specifically in set theory, a set A is a subset of a set B, or equivalently B is a superset of A, if and only if A is "contained" inside B which means that $A \cap B = A$. The relationship of one set being a subset of another is called inclusion or sometimes containment. Let us consider $A = \{t5\}$ and $B = \{t4, t5\}$ two sets of elements. The inclusion relationship between A and B depends on their intersection. The intersection between A and B noted $A \cap B$, is equal to all elements of A belonging to B which means that $A \cap B = \{x \in A \; and \; x \in B\}$ then $A \cap B = \{t5\}$. By encoding elements of A and those of B by using the corresponding prime numbers from Table 2, A and B will be respectively $A = \{11\}$ and $= \{7, 11\}$. The inclusion relationship between A and B can be obtained by using the modulo operation, denoted by *mod*, between the product of elements of B and the product of elements of $(B \; mod \; A)$. Formally, the inclusion relationship between A and B is represented by the following formula:

$$Inclusion(A,B) = \begin{cases} 1 \; if \; \prod_{y \in B} y \; mod \; \prod_{x \in A} x = 0 \\ 0 \qquad\qquad\qquad\qquad else \end{cases}$$

In the previous example, the inclusion relationship between A and B is calculated as follows:

$$A = \prod_{x \in A} x = 11$$

$$B = \prod_{y \in B} y = 7 \times 11 = 77$$

$$\prod_{y \in B} y \; mod \; \prod_{x \in A} x = 77 \; mod \; 11 = 0$$

$$Inclusion(A,B) = 1$$

Thus, we consider a level *L* as a potential level for a query q_i if and only if there is an inclusion relationship between its $code-terms$ and the corresponding query code: $Inclusion(q_i, L.code-terms) = 1$. Jointly, we consider a concept C as a potential concept for a given query q_i if and only if there is an inclusion relationship between its intent and the corresponding query code: $Inclusion(q_i, Int(C)) = 1$. A potential concept is a triplet $C = (X, level, rank)$ where X is a formal concept, $level$ is the corresponding level of the concept X, and $rank$ is a weight assigned to concept X. At this step, the rank of each identified concept is equal to 1. The analysis of the derived coded queries $Q = \{q_1, q_2, \ldots, q_n\}$ yields a set of individual potential concepts, denoted by IPCS. The corresponding pseudo-code for IPCS identifying is shown in Algorithm 1.

Algorithm 1 Locate_Potential_Concepts

end for

end for

After identifying the set of individual potential concepts (*IPCS*), the right intuition consists in identifying the most relevant concept, so-called pivot concept that shares more terms with the user's query. Therefore, it is oversimplified to suppose that the user's query may be covered by only one concept that shares more terms with it. In fact, the considered query may be covered by more than one pivot concept where each one of them shares one or more terms with the launched query. However, together they fully cover the user's query. Let us consider a query defined by the user as follows: "*t1, t5*". There is no concept in the lattice shown in figure 1, which fully covers the launched query. Such a query is covered by two potential concepts: concept $C5$ and concept $C4$. As a result, we suggest identifying an overall set of potential concepts covering together the user query. This latter may include one or more potential concepts. The main idea consists in iteratively crossing the coded lattice in order to identify a new potential concept which is subsumed by two or more potential concepts among the set of individual potential concepts. We suggest adding each identified potential concept to the set of *IPCS* and deleting its subsumers among the set of *IPCS*.

Let $C1 = (A1, B1)$ and $C2 = (A2, B2)$ be two concepts where $A1$ and $B1$ are the extent (a set of objects) and the intent (a set of attributes) of $C1$. Jointly, $A2$ and $B2$ are the extent and the intent of $C2$. $C1$ is subsumed by $C2$ if and only if $A1 \subseteq A2$, or, equivalently, $B2 \subseteq B1$ Carpineto and Romano (2000). By encoding the intent of $C1$ (the elements of $B1$) and the intent of $C2$ (the elements of $B2$), using prime numbers, the subsumption relation between $C1$ and $C2$ can be obtained based on the inclusion relationship between the intent of $C1$ and the intent of $C2$. Accordingly, the concept $C1$ is subsumed by the concept $C2$ if and only if there is an inclusion relationship between the intent of $C2$ and the intent of $C1$: $Inclusion(B2, B1) = 1$. Therefore, we employ the following formula to determine if the concept $C1$ is subsumed by the concept $C2$:

$$subsume\ (C1, C2) = \begin{cases} 1 & if\ Inclusion\ (B2, B1) = 1 \\ 0 & else \end{cases}$$

As an example, let us consider the concept $C5 = (\{d4, d7, d6\}, \{t2, t1\})$ and $C7 = (\{d4, d6\}, \{t2, t1, t4\})$, two concepts of the lattice shown in figure 1 where $C7$ is subsumed by $C5$. By encoding the attributes of $C7$ and those of $C5$ using the corresponding prime numbers from table 2, $C5$ and $C7$ will be respectively $C5 = (\{d4, d7, d6\}, \{6\})$ and $C7 = (\{d4, d6\}, \{42\})$ as shown in the coded lattice shown in figure 2. There is an inclusion relationship between the intent of the concept $C5$ and the intent of the concept $C7$: $Inclusion\ (Int\ (C5), Int\ (C7)) = Inclusion\ (6, 42) = 1$, which means that the $subsume\ (C5, C7)$ is equal to 1, suggesting that the concept $C7$ is subsumed by the concept $C5$. We suggest crossing the coded lattice and using the previous formula in order to identify an overall set of potential concepts over the set of individual potential concepts. In this study, we distinguish two cases for the set of individual potential concepts ($IPCS$):

1- If the set of *IPCS* contains only one potential concept, then, this latter represents the only item of the overall set of potential concepts, jointly it is the pivot concept;

2- If we have more than one potential concept, we suggest using the subsumption hierarchy of the coded concept lattice to find an overall set of potential concepts. The main idea is to sort the set of *IPCS* in an ascending order according to the level values of the potential concepts. Then, we suggest crossing the lattice by starting from the *First Individual Potential Concept*, denoted by *FIPC*, which owns the highest level (the top level) in order to identify a new potential concept, which is subsumed by two or more individual potential concepts. Moreover, once the *FIPC* is

identified, early, we consider its bottom cover $SUBS_0 = bottom - cover\ (FIPC)$ and we distinguish the following cases.

(a) If we identify a concept among the set of $SUBS_0$ which is subsumed by two or more individual potential concepts, then this latter will be considered as a potential concept. Each identified potential concept will be added to *IPCS* and all its subsumers will be deleted from *IPCS*, which yields a new set of *IPCS*. Each identified potential concept is assigned a weight that is equal to the sum of the weights of its subsumers among the set of *IPCS*. The assigned weight reflects the number of subsumers among the first set of *IPCS*. Once we have added a new potential concept to *IPCS*, we continue in the same way to identify the new *FIPC* and handle its bottom cover $SUBS_0$ in order to find a new potential concept. Let us note that if we reach an *IPCS* that contains only one element, this means that we have identified the most relevant concept that fully covers the user query, resulting in stopping the retrieving process;

(b) If there is no concept among the set of which $SUBS_0$ is subsumed by two or more individual potential concepts among the set of *IPCS*, then, the next step consists in considering $SUBS_1 = bottom - cover\ (SUBS_0)$ and we handle the emerging set as explained in the first case. Let us note that an empty set of $SUBS_j$ means that the bottom concept $\perp$ is reached, which involves stopping the retrieving process.

We note that the search process of the overall set of potential concepts follows an iterative process. Iterations stop when a fixed point is obtained: the set of *IPCS* contains only one potential concept, or we reach the bottom concept. We call the final kept set of individual potential concepts (*IPCS*) a set of overall potential concepts, denoted by *OPCS*. Let us note that, the pivot concept is an individual potential concept that owns the greater weight. The corresponding pseudo-code for *OPCS* identifying is shown in Algorithm 2.

$PVC \leftarrow false$

end if

end if

end while

if $|IPCS| = 1$ then

$PVC \leftarrow false$

end if

end while

$OPCS \leftarrow IPCS$

Once the *OPCS* is identified, we are ready to answer the user's query. Each overall potential concept among the set of *OPCS* represents a retrieval starting point. We suggest crossing the concept lattice in order to find the super-hierarchy of each overall potential concept in order to build a step-wise outcome in the same way as in Messai et al. (2006). Our goal is to return a ranked list of relevant documents, denoted by *LD*. At first, the set of *OPCS* will be sorted in a descending order according to the concepts' weights (the procedure *Sort-Concepts-Rank*). The first overall potential concept represents the most relevant concept, co-called *pivot concept*, denoted by P, which shares more terms with the user query. Accordingly, it is subsumed by the majority of individual potential concepts of the initial kept set of *IPCS*. Therefore, we start by handling the pivot concept $(SUP_0 = \{P\})$ by adding all objects forming its extent to the list of relevant documents *LD* with a rank equal to 1 and we increment the rank by 1. The next step consists in considering $SUP_1 = upper - cover\ (SUP_0)$ and the objects that are not yet included in the result (the list *LD*), so-called *emerging objects*, are added to *LD* with the corresponding rank and we also increment the rank by 1. We proceed in the same way for SUP_2 , SUP_3 etc. until an empty set SUP_n is reached. Let us note that if the Top concept is reached and if its intent is an empty set, then the objects in its extent are ignored. In the same way, we handle each potential concept of the ranked *OPCS* while continuing to increment the rank. The corresponding pseudo-code for outcome building is shown in Algorithm 3.

Algorithm 3 Deal_Outcome

Require: A set of overall potential concepts (*OPCS*) and a coded lattice

Ensure: A ranked list of relevant documents (*LD*)

$LD \leftarrow \emptyset$

$DOC \leftarrow \emptyset$

$rank \leftarrow 1$

$j \leftarrow 0$

$List \leftarrow Sort - Concepts - Rank(OPCS)$

for $each\ Concept\ C = (A,B) \in List$ do

$j \leftarrow 0$

$SUP_j \leftarrow C = (A,B)$

$DOC \leftarrow A \setminus LD$

if $DOC = \emptyset$ then

$LD \leftarrow LD \cup (DOC, rank)$

$rank \leftarrow rank + 1$

end if

$j \leftarrow j + 1$

$SUP_j \leftarrow upper - cover\ (SUP_{j-1})$

while $SUP_j = \emptyset$ do

$DOC \leftarrow \emptyset$

for $each\ Concept\ C2 = (X,Y) \in SUP_j\ such\ that\ Y = \emptyset$ do

$DOC \leftarrow DOC \cup X$

end for

$DOC \leftarrow DOC \setminus LD$

if $DOC = \emptyset$ then

$LD \leftarrow LD \cup (DOC, rank)$

$rank \leftarrow rank + 1$

end if

$j \leftarrow j + 1$

$SUP_j \leftarrow upper - cover\ (SUP_{j-1})$

end while

end for

We note that, thanks to the way our algorithm proceeds to retrieve relevant objects for a given query, we are able to achieve high performances in term of recall and precision. In fact, unlike the most FCA-based IR algorithms Carpineto and Romano (2000); Godin et al. (1995a); Messai et al. (2006, 2005), a distinctive highlight in our method consists in identifying not only the most relevant concept but also in suggesting to identify each potential concept that allows us to fully cover the considered query. In order to answer a user's query, our algorithm identifies a ranked set of overall potential concepts according to the concepts' weights. Then, it keeps the relevant objects from each overall potential concept and its superconcepts according to their order. In this way, our algorithm allows us to increase recall without decreasing precision.

Conclusion and Future Work

In this paper, we described our method of lattice-based information retrieval using FCA and prime numbers, and we proposed an algorithm, called *PNBLSearch*, to retrieve relevant objects for a given query. Specifically, we used prime numbers to encode both the concepts' intents of the lattice and the user query in order to make comparison an easier operation. This allowed us to minimize run-time. In addition, we suggest an intermediate representation of the resulting lattice (coded lattice) as a ranked list of levels according to the cardinality of concepts' intents. We call this way of representation an *Intermediate Representation of Lattice*, denoted by *IRL*. It aimed at reducing the number of concepts to be handled which allows us to accelerate the retrieval process.

The proposed algorithm starts by dividing the user query into a set of elementary queries and coding them using the corresponding prime numbers yielding a set of coded queries. The retrieval process is comprised of three steps. The first one consists in identifying a set of individual potential concepts, denoted by *IPCS*, as a direct response to the set of coded queries, one per query. The second step consists in identifying a set of overall potential concepts, denoted by *OPCS*, by crossing the coded lattice over the set of *IPCS* which represents a set of retrieval starting points. The final step consists in building the final outcome by crossing the lattice over the set of *OPCS* which contains the set of retrieval starting points. Let us note that, thanks to the way our algorithm proceeds to retrieve relevant objects for a given query, we are able to achieve high performances in term of recall and precision.

As a perspective to this study, we might include the following. First, a desirable future research should focus on the way of sorting or ranking the retrieved documents in order to enhance the quality of the returned ranked-list of documents. This would allow for making retrieval more precise. Second, we are also planning to consider complex formal contexts such as multi-valued and fuzzy formal contexts.

Abstract

Recent transformational change in higher education of Malaysian National Higher Education Strategic Plan was in response to the globalization era and the internationalization of higher education. In order to fulfill the aspiration of achieving its seven strategic thrusts, higher education institutions have now become the objects of greater public scrutiny. The seventh strategic thrust has stressed on effective implementation and monitoring for best delivery systems in the education system. Unlike public companies, higher education institutions do not have a regulatory requirement that mandates such changes, so there is no direct incentive to implement them. However, improved governance and control benefits all organizations. Unfortunately, in achieving the effectiveness of internal audit function in the higher education institutions, internal audit departments need to face various challenges. This paper serves as a discourse on the debate regarding the role of internal auditing in the public sector by focusing on the practice of internal auditing in Malaysian public universities, highlighting on the effectiveness of its practice. This study attempts to examine the effectiveness of internal audit function in Malaysian public universities by considering the impact on internal audit quality, management support, organizational setting and auditees' attributes. The paper examines 82 survey questionnaires applicable to the main issue focused by this study. The survey questionnaires are distributed by mail or delivered in person to head of internal auditors, internal auditors and assistant auditors in 19 Malaysian public universities with an established internal audit department. The paper concludes that auditees' attributes is the major factor influencing the effectiveness of internal audit function in Malaysian public universities. The paper highlights and serves as a wake-up call for practitioners in auditing of public universities to work towards a paradigm shift from the current auditing practice to a more effective practice. This paper also offers practical help to regulators, higher education institutions and auditors in providing a direction of existing transformation strategies for higher education and to formulate future strategies in enhancing the internal audit effectiveness in Malaysia public universities.

Keywords: Internal auditing, Management support, Organizational behaviour, Higher education institutions.

1. Introduction

In response to the globalization era and the internationalization of higher education, the Malaysian Ministry of Higher Education (MOHE) has put in place strategic goals for the transformation of higher education in Malaysia. This transformational change of higher education has been put forward through the National Higher Education Strategic Plan (NHESP), which outlines a number of strategies that will be adopted to reinvigorate Malaysian higher education in order to provide a solid foundation for the future. There are seven strategic thrusts under the NHESP, which was published in August 2007 for planning and strategizing higher education sector in order to meet the country's aspiration in transforming Malaysia as a regional hub for educational excellence providing world-class university education. In order to fulfill this aspiration, higher education institutions have become under greater public scrutiny since none of Malaysian institute of higher education secured a position in the Top 100 in the recent Times Higher Education (THES) World University Ranking 2012 – 2013[i].

The seven thrusts of the NHESP 2007 are certainly broad-based: widening access and enhancing quality; improving the quality of teaching and learning; enhancing research and innovation; strengthening institutions of higher education; intensifying internationalization; enculturation of lifelong learning; and reinforcing of MOHE's delivery system. The seventh strategic thrust has stressed on effective implementation and monitoring for best delivery systems of MOHE[ii]. For the purpose of monitoring quality of higher education, the MOHE also setting up an audit unit as it need an independent assessment of higher education institutions and subsequently promoting good governance (Sirat, 2010). Thus, in the higher education institutions, the internal audit function in strengthening the corporate governance cannot be denied.

In Malaysia, the need to establish an internal audit function within the public sector including statutory bodies has been set out in Treasury Circular No. 2/1979 (Implementation of Internal Audit in a Government Agency of Federal Territory). However, in 2004, Treasury Circular No. 9 (Implementation of Internal Audit in Ministry/Federal Department and State Government) has been issued by the Government to replace the 1979 circular. There is no circular issued specifically for higher education institutions. However, as part of the statutory bodies, public universities are tied by law to abide by this circular.

Internal audit is not an easy undertaking within higher education. Unlike public companies, higher education institutions do not have a regulatory requirement that mandates such changes, so there is no direct incentive to implement them. However, improved governance and control benefits all organizations. Unfortunately, in achieving the effectiveness of internal audit function in Malaysian higher education institutions, internal audit departments are facing various challenges. Among others, lack of auditors with competency on auditing techniques, insufficient support obtained from management of the institution, lack of compliance (Protiviti, 2008), lack of cooperation from auditees, superfluous bureaucratic procedures on to a system and difficult relationship between the institutions and MOHE (Sirat, 2010).

Mihret and Yismaw (2007) developed a model of potential factors that could influence an internal audit effectiveness consisted of four interrelated factors, which are internal audit quality, management support, organizational setting and auditee attributes. Based on this model, this study intends to investigate the effectiveness of internal audit function in Malaysian public universities by considering the impact of internal audit quality, management support, organizational setting and auditees' attributes.

The remainder of the paper has four main sections. First section discusses on the issues of internal auditing in higher education institutions followed by theoretical discussion and hypotheses development. Next, the research methodology is described. Subsequently, the results are analyzed and presented. Finally, there is a discussion of the findings and a brief conclusion.

2. Literature Review and Formulation of Hypotheses

The landscape of global and national higher education is in constant changes. As a result, the following challenges are likely to become trends in higher education in many countries such as shaping the knowledge society, generating employability, internationality, and development of teaching and learning (Sirat, 2010). This global diversity of challenges has called on governance and accountability awake in which case the internal audit departments also playing the vital role (Ahmad et al., 2009).

The objective of internal auditing is to assist all members of organization in the effective discharge of their responsibilities by furnishing them with analyses, appraisals, recommendations and valuation comments concerning the activities reviewed. This involves going beyond accounting and financial records to obtain a full understanding of the operations under review. Previous studies on the factors influencing the effectiveness of internal audit have obtained different outcomes.

In public sector, Van Gansberghe (2005) suggested that the effectiveness of internal audit could be judged by the extent to which its function ensure the efficient and effectiveness of service to customers. This situation is directly demanding the commitment of internal audit to serve better. Montondon and Fischer (1999) stressed that the credibility of the internal audit function is significantly more important in public entities as compared to private entities. This fact are supported by Khoury (2011) who stated that internal audit function in public sector must have greater competency and professionalism to minimize and manage risk due to larger and more complex operations. An effective internal audit function helps organizations to add value and strengthen their operations (Ahmad et al., 2009). In addition, internal audit function could serve as a monitoring device and part of the corporate governance mosaic (Cohen et al., 2002). According to Dominic and Nonna (2011), internal audit function is well placed to provide internal assurance on corporate governance processes, including internal control and risk management.

Varieties of approaches are used to determine appropriate criteria to evaluate the effectiveness of the internal audit function. For example, the degree of compliance with standards, the objective of internal audit function as well as the independence of internal auditor are among the factors will affects internal audit performance. Khoury (2011) suggested that the effectiveness of the internal audit function depends upon several factors, such as: true independence; a good understanding of issues facing the organization; responsiveness to management's needs; proactive communication with management; implementation of recommendations; matching of skills set to needs; and use of technology to work more effectively. In addition, there are five main pillars that are considered critical for building an effective internal audit function in the public sector. These are perception and ownership, improved processes and governance, legislative support, improved incentives and a commitment to change.

A study by Albrecht et al. (1988) on 13 best internal audit departments in the US indicated that corporate environment, support from management, quality of internal auditors, and quality of internal auditor work have contributed to effective internal audit. Meanwhile, Van Gansberghe (2005) has identified six key factors that influence the effectiveness of internal audit namely the improvement of professionalism, conceptual framework, resources, perceptions and ownership, legislation, and organization and governance framework.

Differently, apart from legal requirement and the competency of internal audit's staff, Sterck and Bouckaert (2006) discovered that management’s support, the existence of the audit committee as well as special unit for enhancement of the internal audit function which contributed significantly to the effectiveness of the internal audit function. Mihret and Yismaw (2007) explained that internal audit quality consist of the expertise of staff, scope of service, effective audit planning, fieldwork, controlling and effective communication. In addition, they also found that apart from the quality of internal audit, management support is also a major factor affecting the effectiveness of internal audit.

Recently, Ahmad et al. (2009) found the similar factors like Mihret and Yismaw (2007). A study by Ahmad et al. (2009) revealed that support from management is the second most important factor influencing the effectiveness of the internal audit function in the public sector. Ahmad et al. (2009) also found that the competence of internal audit, quality of work performed and objectivity as the factors in evaluating the internal audit quality.

The above studies motivate this study to carry out a similar study, but in the context of the Malaysian public universities. Using a model developed by Mihret and Yismaw (2007), this study conjecture that internal audit quality, management support, organizational setting and auditee attributes may have a positive influence on the internal audit effectiveness in Malaysian public universities.

2.1 Formulation of the Hypotheses

i) Internal Audit Quality. The literature advanced the argument that the quality of internal audit is the major factors influencing the effectiveness of the internal audit function in the public sector (Mihret & Yismaw, 2007; and Ahmad et al., 2009). Past studies reported that among the qualities of internal audit is the competency of internal audit's staff and their works (Albrecht et al., 1988; and Sterck & Bouckaert, 2006) and improvement in professionalism (Van Gansberghe, 2005). These studies have supported the significant relationship between internal audit quality and internal audit effectiveness. The quality of internal audit is examined by the following hypothesis:

H1: *There is a significant positive association between internal audit quality and internal audit effectiveness in Malaysian public universities.*

ii) Management Support. Past studies found that management support contributed significantly to the effectiveness of the internal audit function (Albrecht et al., 1988; Mihret & Yismaw, 2007; and Sterck & Bouckaert, 2006). Reporting in the Malaysian public sector, Ahmad et al. (2009) observed management support to be the second important factor in the effectiveness of internal audit since with such support, sufficient resources are usually allocated to the function and its recommendations implemented. This study suggests that interaction between internal audit department and management on a close and regular basis is needed since, the character of the function is determined completely by the management support. In addition, the involvement of management in formulating the audit plan is both necessary and unavoidable since it is through the management that internal auditors are empowered to secure access to the various departments in the organization. This implies that this study expect a positive relationship between management support and internal audit effectiveness. Consequently, the effect of management support is examined by the following hypothesis:

H2: *There is a significant positive association between management support and internal audit effectiveness in Malaysian public universities.*

iii) Organizational Setting. Organizational setting criteria that indicates the context in which internal audit operates consist of the profile of organization, budgetary status of the internal audit departments and internal organization. The organizational policies and procedures are also significant criteria that guide operation of auditees (Mihret &Yismaw, 2007). Organizational setting includes the status of internal audit in the organizational structure; the probity of internal audit office's internal organization; budgetary status of the internal audit office; and the existence of sound established criteria to evaluate auditees' practices. Most of prior studies have supported the significant relationship between organizational settings on the internal audit effectiveness. The hypothesis to test the organizational setting is as follows:

H3: *There is a significant positive association between organizational setting and internal audit effectiveness in Malaysian public universities.*

iv) Auditees' Attributes. The criterions of auditees' attributes that influence on the internal audit effectiveness may involve the auditees' proficiency to attain organizational sub-goals, their character towards internal audit and the cooperation level that they gave to the auditor. Mihret and Yismaw (2007) found that internal audit effectiveness relates to the auditee's capability to achieve its intended

objectives. This notion is supported by Ahmad et al. (2009) that stated the important of having cooperation from auditees to enable the internal auditors to have full access to all records, assets and activities, thus, help internal audit function provides significant findings and recommendations for auditees' improvement. Dittenhofer (2001) suggested that the sustainability of internal audit department towards internal audit quality will lead to the correctness of auditees procedures and operations, and subsequently will directly influence the effectiveness of the auditees' organization. It is tested by the following hypothesis:

H4: *There is a significant positive association between auditees' attributes and internal audit effectiveness in Malaysian public universities.*

3. Research Methodology

The purpose of this study is to examine the effectiveness of internal audit fuction in Malaysian public universities by considering the impact of internal audit quality, management support, organizational setting and auditees' attributes. The empirical data presented in this paper was collected by the way of questionnaire survey setting. 19 out of 20 public universities in Malaysia[iii] with an established internal audit departments are chosen as the focus of this study. A survey of 166 internal audit practitioners such as head of internal auditors, internal auditors and assistant auditors who are involved directly and/or indirectly with the process of auditing from various public universities in Malaysia was conducted. The interested respondents for this study are chosen in consistent with Calder et al. (1981, p.199) that pointed out "when effects application (in this study, the current practices of internal auditing) is the goal, correspondence procedures require that research participants match individuals in the real world setting of interest". Out of 155 questionnaires distributed by mail or delivered in person and collected back at a later date, only 82 (49.4 percent) responded to this survey.

The questionnaire instruments inclusive of 28 information items adapted from Mihret and Yismaw (2007), Ahmad et al. (2009) and The Institute of Internal Auditors Malaysia (2009) were used in this research survey. The questionnaire is divided into two parts. Part I relates to the respondent's profile, while Part II consists of 28 questions regarding internal audit effectiveness. The respondents were instructed to indicate the relative importance of each item of information on a five-point likert scale. The point values range from 1 as strongly disagree to 5 as strongly agree.

One issue that has emerged related to the internal auditing practices is the proper and sound measurement of the internal audit effectiveness. Barrett (1986) noted that an effectiveness of internal audit can be described. However, it is difficult to quantify and finally it is determined by the perception of auditees. Thus, following Arena and Azzone (2009), this study measures the internal audit effectiveness as the percentage of internal auditors' recommendations implemented by the auditee (PIARIA). This dependent variable was measured though a 5-point Likert type items. The point values are as follows: 1 – no implementation action (0 percent); 2 – low level of implementation action (below 20 percent); 3 – medium-low level of implementation action (between 20 to 50 percent); 4 – medium-high level of implementation action (between 50 to 80 percent); and 5 – high level of implementation action (more than 80 percent). Table 1 depicts the measurement for the independent variables of this study.

Table 1: The Measurement of Independent Variables

Variables	Measurement
Internal Audit Quality	Focusing on staff expertise; effective audit planning; fieldwork and controlling; and effective communication.
Management Support	Focusing on response to audit findings; and commitment to strengthen internal audit.
Organizational Setting	Focusing on organizational profile; internal organization; organizational policies and procedures; and budgetary status of internal audit department.

Auditees' Attributes	Focusing on auditees' attitude towards internal audit and level of cooperation to the auditor.

The findings of the research are achieved through the analysis of the responded surveys using the relevant statistical tests. To examine the impact of internal audit quality, management support, organizational setting and auditees' attributes on the effectiveness of internal audit function in Malaysian public universities, the ordinary least square (OLS) regression model was adopted in the analysis. The OLS regression model is defined by the following equation:

$$IAE_i = \alpha + \beta_1 IAQ_i + \beta_2 MS_i + \beta_3 OS_i + \beta_4 AA_i + \varepsilon$$

Where *IAE* is an internal audit effectiveness; *IAQ* is an internal audit quality; *MS* is management support; *OS* is an organizational setting; *AA* is auditees' attributes; α is a constant; β is a coefficient; and ε is the error term.

4. Findings and Discussions

The analysis commences with the demographic profile of respondents. Next, if followed by descriptive statistics of internal audit effectiveness, internal audit quality, management support, organizational setting and auditees' attributes. Finally, this study presents the results of OLS regression model.

4.1 Demographic Profile of Respondents

Table 2 presents the summary of demographic profile of the respondents segregated by designation, highest level of education, professional qualification and working experience.

Panel A shows that most of the internal audit department in Malaysian public universities having more internal audit assistants as compared to internal auditors in performing the internal audit. In addition, Panel B depicts that more than 50 percent of the respondents are holding a bachelor degree. There are only eight respondents (less than 10 percent) who hold the highest level of academic qualification which is master degree. Overall, this indicates that the respondents are equipped with good academic qualification in performing the audit work. However, majority of the respondents (80.5 percent) did not have professional accounting/auditing qualification from professional bodies such as Institute Internal Auditors of Malaysia (IIAM) and Malaysian Institute of Accountants (MIA).

Table 2: Demographic Profile of Respondents

	N	Percentage	Cumulative Percentage
Panel A: Designation			
Head/Chief of Internal Auditor	16	19.50	19.50
Internal Auditor	26	31.70	51.20
Internal Audit Assistant	40	48.80	100.00
Panel B: Highest Level of Education			
Master Degree	8	9.80	9.80

Bachelor Degree	44	53.60	63.40
University/College Diploma	30	36.60	100.00
Panel C: Professional Accounting/Auditing Qualification			
Yes	16	19.50	19.50
No	66	80.50	100.00
Panel D: Working Experience			
5 years and below	30	36.60	36.60
Between 6 to 10 years	26	31.70	68.30
Between 11 to 15 years	14	17.10	85.40
Between 16 to 20 years	7	8.50	93.90
21 years and above	5	6.10	100.00
TOTAL	**82**	**100.00**	**100.00**

Meanwhile, Panel D of the Table 2 depicts than less than 50 percent of respondents are above ten years in seniority while servicing in the internal audit departments of Malaysian public universities. Besides that, 30 percent of the respondents are working less than five years.

4.2 Descriptive Statistics on Internal Audit Effectiveness

Table 3 presents the descriptive statistics on internal audit effectiveness for this study. Panel A reveals the information on the type of audit assignment that the respondents carried out in the organization.

Table 3: Descriptive Statistics on Internal Audit Effectiveness

	YES (Percentage)	**NO (Percentage)**
Panel A: Type of Audit Assignment Carried Out		
Financial Audit	89.00	11.00
Compliance Audit	89.00	11.00
Management Audit	90.20	9.80
Performance Audit	84.10	15.90
Information & Communication Technology Audit	64.60	35.40
Special Audit / Investigation	82.90	17.10
Others	7.30	92.70
Panel B: Type of Audit Planning		
Strategic Plan (5-Years Plan)	29.30	70.70
Annual Plan	100.0	0.00
Individual Audit Assignment Plan	59.80	40.20
Others	2.40	97.60

This study reveals that majority of internal audit departments in Malaysian public universities have been extended their scopes of audit assignment not only on the financial and compliance audits, but also on performance and information and communication technology audits. The highest percentage of audit assignment carried out by the respondents is management audit (90.20 percent), followed by financial and compliance audits, both 89.00 percent. Moreover, a total of 64.6 percent respondents indicate that they have carried out an information and communication technology audit. Finally, there are only 6 respondents (7.3 percent) stated that they also carried out other assignments such as verification of data. The extended of the scopes of audits perhaps could lead to the effectiveness of internal audit function by improving the organizations' internal control and governance process.

Panel B of Table 3 deals with the type of planning in internal audit departments of Malaysian public universities. The result shows that among various types of audit planning, all Malaysian public universities have an annual audit planning for their internal audit department. In addition, more than 50 percent of respondents have their own individual audit assignment plan. However, there are only 29.30 percent of respondents stated that they had strategic audit planning for their internal audit department. This may indicate that there is lack of awareness of the importance of having strategic

long-term audit planning for the public universities organizations. By having strategic long-term audit planning, it is not only will guide the path of internal audit departments, but it may contribute to proper improvement of audit plan strategies for future.

4.3 Descriptive Statistics on Independent Variables

Table 4 presents the information on the mean, minimum and maximum scores of the internal audit quality, management support, organizational setting and auditees' attributes of this study. Based on the 5-points Likert scale, the score value of three and above indicates that the internal audit quality, management support, organizational setting and auditees' attributes are effective in contributing to the internal audit effectiveness in Malaysian public universities. Table 4 exhibits that all the factors are effective in contributing to the internal audit effectiveness with the mean score of 3.9085 (management support) and above. The organizational setting shows the highest mean score at 4.1777 while the internal audit quality and auditees' attributes shows the mean score of 4.1069 and 4.0061, respectively. The maximum score for all of the variables are 5.00 and the lowest minimum score is 1.5 which is recorded by management support.

Table 4: Descriptive Statistics on Independent Variables

Variables	N	Mean	Minimum	Maximum
Internal Audit Quality	82	4.1069	3.00	5.00
Management Support	82	3.9085	1.50	5.00
Organizational Setting	82	4.1777	3.14	5.00
Auditees' Attributes	82	4.0061	2.00	5.00

4.4 Ordinary Least Square (OLS) Regression Results

The OLS regression analysis is performed to consider the impact of internal audit quality, management support, organizational setting and auditees' attributes on the internal audit effectiveness. Table 5 portrays an OLS regression results conducted in this study. To investigate the existence of multicollinearity in the estimation for the regression analysis, the tolerance (TOL) values for each of the independent variables are computed. As reported in Table 5, the TOL are always more than 0.1, suggesting that multicollinearity problem is not likely to be a major factor driving the results of this study.

Table 5: Ordinary Least Square (OLS) Regression Analysis Result

Independent Variables	TOL	Model 1	
		Coeff	*t*-stat
Internal Audit Quality	0.460	0.254	1.741*
Management Support	0.567	0.059	0.442
Organizational Setting	0.540	0.083	0.610
Auditees' Attributes	0.643	0.529	4.452***
Constant		1.858	3.847***
R-square		19.90%	
Adjusted R-square		18.90%	

Note: Association is significant at the *** 1 percent level; ** 5 percent level; * 10 percent level, respectively,
using two-tailed test.

The OLS regression model is significant; however, the explanation power of the model is quite low, with an adjusted R-square value of 18.90 percent. This indicates that 18.90 percent of the variation in the internal audit effectiveness of Malaysian public universities can be explained by the variables specified in the model. In comparing the contribution of each independent variable to the prediction of dependent variable (internal audit effectiveness), the Beta value under Standardized Coefficients is referred to. Results from Table 5 shows that the auditees' attributes makes the strongest contribution to the prediction of internal audit effectiveness in Malaysian public universities (Beta = 0.529), while management support is the least contributor (Beta = 0.059).

Focusing on the linear relationship, the result shows that the auditees' attributes has a significant positive relationship with internal audit effectivess at 1 percent level. This results is consistent with Ahmad et al. (2009), Dittenhofer (2001) and Mihret and Yismaw (2007), suggesting that auditees of Malaysian public universities have given proper cooperation to internal audit departments when needed. Building upon such a fundamental relationship, internal auditors and auditees should develop a professional and mutually trusting relationship, resulting in a more effective and quality-oriented audit. In such good relationship, auditees may also have provided enough access to all relevant records, documents and properties for auditing purposes. Trusted and comprehensive information provided by the auditees have assisted the internal audit functions staff in evaluating the auditees' control and governance processes effectively, which in turn contributed positively to the auditees' organization improvement. Hence, this provides support for the alternative hypothesis (H4) that auditees' attributes is positively associated with internal audit effectiveness.

Internal audit quality has a marginal significant positive association with internal audit effectiveness. The positive association is similar to previous studies by Ahmad et al. (2009), Albrecht et al. (1998), Dittenhofer (2001), Mihret and Yismaw (2007), Sterck and Bouckaert (2006) and Van Gansberghe (2005), which revealed that the internal audit quality influenced the internal audit effectiveness. This suggests that a quality internal audit works in the internal audit department could produce significant findings and recommendations for the auditees to take action for universities' improvement. This result provides support for the alternative hypothesis (H1) that there is a significant positive association between internal audit quality internal audit effectiveness.

Management support and organizational setting variables are not significantly associated with internal audit effectiveness. Internal audit functions require the involvement of everyone in the organization. This calls for commitment from management to integrate the internal audit results and recommendation into the organization activities and in all function under the control of other departments clearly linking internal audit to the objectives. However, this study did not show enough evidence for the association between management support and internal audit effectiveness. Perhaps, management support or reactions to the internal audit report depend on their pattern of general attitudes and behaviours. According to Hogwood and Dunne (1984), personal objectives are the prominent factors for their behaviours and statements, which are concerned with social objectives and sustainability of organization. In the absence of such fruitful interaction between the management and internal auditors, effectiveness of both parties is damaged. Hence, the insignificant association between management support and internal audit effectiveness failed to accept the alternative hypothesis (H2).

Contrast to Mihret and Yismaw (2007), this study also failed to accept the alternative hypothesis (H3) since there is no association between organizational setting and internal audit effectiveness in Malaysian public universities. This study discovers that organizational setting did not contribute to the internal audit effectiveness even though most of the internal audit department in the Malaysian public universities has been given high status in the organizational structure by reporting functionally directly to the university's board and administratively to the Vice Chancellor.

5. Conclusion

This study provides evidence on the current practice of internal audit function in Malaysian public universities. This study embarks to provide evidence on the association between internal audit quality, management support, organizational setting and auditees' attributes with internal audit effectiveness in the context of Malaysian public universities. Using survey questionnaire distributed to the sample of 82 internal audit practitioners in Malaysian public universities, the analysis is done using OLS regression model. Overall, this study confirms a significant positive relationship between auditees' attributes, internal audit quality and internal audit effectiveness. This means that, in Malaysian public universities, committed auditees are self-driven and are directed to organizational internal audit goal achievement and subsequently contributes to internal audit effectiveness. The result is consistent with the argument that coordination and cooperation are essential between auditees and internal auditors in order to facilitate the overall process of audit and to raise the professional profile of the function (Messier et al., 2011). On the other hand, the results for variables of management support and organizational setting are in contrast with the previous studies.

In this regard, it is vital for universities' management to give adequate attention to the factors that did not contribute to internal audit effectiveness such as internal audit quality, management support and organizational setting. Considering that the variable of management support could drive the universities' pathway, the universities should aim at creating a committed management work force for better support on internal control audit function. More research could be carried out on the effectiveness of internal audit function and employee attitude on organizational performance as a whole. This study propose for more research to be extend on the effectiveness of internal audit function in other government agencies as well as private sectors.

Acknowledgement

We are grateful to Ministry of Higher Education Malaysia for sponsoring this research project through ARIHICoE research grant and to Universiti Teknologi MARA for the support.

Abstract

The renaissance of Islamic finance indicates that people are increasingly concerned with the Shari'ah-complaint nature of commercial and non-commercial activities. Conventional financial institutions are immersed in elements of interest, uncertainty, and gambling, all of which are forbidden in Quran and Sunnah. Shari'ah-complaint finance is thus at the core of Islamic financial institutions; it is the distinguishing factor between Islamic and conventional finance. With due diligence, international organisations such as the Accounting and Auditing Organisation for Islamic Financial Institutions (AAOIFI), Islamic Financial Services Board (IFSB), and Bank Negara Malaysia (BNM) have formulated a Shari'ah governance framework; Malaysia is thus positioned at the centre of the global Islamic finance and takaful industries. The Shari'ah governance framework monitors Islamic financial institutions with regards to their functioning within the framework of the Shari'ah. Current research on Shari'ah governance mainly focuses on financial practices within profit-oriented organisations (i.e. Islamic banks, takaful, and Islamic capital markets). There is limited research on governance practices within non-profit organisations, especially in Waqf (Islamic endowment) institutions. The practice of Waqf is encouraged in Islam, and the establishment of the Prophet's mosque in Madinah set the precedent for such deeds. Waqf can play a significant role in improving a country's economy and in uplifting the living standards of Muslims. However, the effectiveness of the management of Waqf assets has deteriorated over time due to several factors. Two of the major factors for this are lack of Shari'ah governance guidelines and lack of a framework for Waqf institutions. This paper proposes to introduce Shari'ah-based governance for Waqf institutions with the expectation that the proposed governance system will structure the management of Waqf assets so as to comply with Shari'ah requirements related to Waqf assets, and to foster accountability and transparency in practices and disclosures.

Key words: Accountability, Management, Islamic financial institutions, *Shari'ah* governance, *Waqf*

1.0 Introduction

The management of Waqf assets has deteriorated over time due to numerous factors. Two of the major factors affecting the effectiveness are: absence of Shari'ah governance guidelines, and the absence of a framework for Waqf institutions. Since the success of any business organisation depends on the efficacy of its management, it is essential to streamline management in the case of Waqf institutions for the latter to be successfully revived.

Currently, some of the challenges facing Waqf institutions are: unqualified Mutwallis (Waqf managers), absence of planning, lack of funds, inadequate awareness of Waqf, and land issues. Ineffective utilisation of Waqf assets means that even operating costs are barely covered; the salaries that Waqf institutions pay to their staff are very unsatisfactory; there is insufficient income to distribute among beneficiaries (Abdullah, 2010 & Chowdhury, et al., 2012). Misused of Waqf assets, lack of management skills of Waqf (Noor Aimi et al., 2014). Legal issues pertains to land (Mohamad et al., 2012). Fiqhi issues in management (Kahf, 1999). Accountability issues and challenges in Waqf (Sulaiman, 2015; Ramli and Muhamed, 2013; Daud et al., 2011; Osman, 2010; Ihsan et al., 2009). Disclosure issues and problems in Waqf (Sulaiman et al., 2009; Daud et al., 2011). The best way to tackle these problems and issues is to introduce Shari'ah governance guidelines and a framework for Waqf institutions to improve financial management as well as to enhance Shari'ah-compliance.

2.0 Prevailing Shari'ah Governance Models for Islamic Financial Institutions

Since Shari'ah-compliance is the foundation of Islamic financial markets, organisations such as AAOIFI and IFSB have issued their guiding principles for Shari'ah governance. In addition, many countries which encourage the development of Islamic finance have their own Shari'ah governance models in practice. In Malaysia, Bank Negara Malaysia (BNM) has taken the initiative to implement the Shari'ah governance framework. At the national level, the Shari'ah Advisory Council (SAC) has the highest authority, and each individual Islamic financial institution is required to have its own Shari'ah advisory board. The members of SAC are not allowed to serve as Shari'ah advisors at the institutional level. Similarly, Pakistan, has its own SACs at the State Bank and Shari'ah advisory boards at the institutional level.

In Kuwait, there is no central Shari'ah governing body at the central bank level, but there is a "Fatwa Board" in the Ministry of Awqaf and Islamic Affairs, to which any conflict in Shari'ah issues can be referred. This board is external to the central bank, and members of the Fatwa Board can be members of a Shari'ah board at the same time. There is also no restriction on as to how many separate institutions they can provide their Shari'ah advisory services to. In Bahrain, there is an SAC at the Central Bank, and each institution is required to have its own advisory board. In terms of restrictions regarding board members, the practice is similar to Kuwait. In the case of governance guidelines, Bahrain has adopted AAOIFI governance standards. In the United Arab Emirates, there is an SAC at the central level, and each institution has its own Shari'ah board. There are no restrictions on the Shari'ah advisors. In Qatar, there is no SAC, but if there is any dispute, the Supreme Shari'ah Council will appoint a Shari'ah scholar to resolve it. There are no restrictions on Shari'ah advisory structures in terms of what institutions they can provide their services to (Hasan, 2007; Hasan, 2010).

We see, then, that countries employ various approaches to achieve the objectives of Islamic finance, i.e. Shari'ah-compliance. However, to the extent of our knowledge, there is neither a Shari'ah framework nor guidelines for Waqf institutions in place. It is owing to this that Waqf institutions throughout the Muslim world have ineffective managerial bodies.

One of the means to achieve Shari'ah-compliance and to increase the accountability of management is to have a good Shari'ah governance structure with effective implementation. To this end, there is no Shari'ah governance framework for Waqf institutions although the establishment of Waqf framework is very crucial and essential.

Consequently, this paper proposes some principles as the building blocks for preparing the Shari'ah governance for Waqf institutions. These principles are drawn from the primary sources of Shari'ah and referring to the standards, framework and guidelines issued by AAOIFI, IFSB, and BNM. The proposed principles are: Islamic accountability and responsibility, independency and objectivity, commitment, consistency, Shari'ah audit and review, transparency, disclosure, and ethicality.

3.0 Conclusion

This paper has given an account of Shari'ah governance practices in selected countries. We have proposed principles which we think ought to form the foundation for good Shari'ah governance in Waqf institutions. These principles are derived from the Shari'ah, and are seen as suitable in the context of corporate governance. It is hoped that the practices proposed in this paper will be of interest to industrial players, regulators, investors, and to the public in general. Since this paper is written based on reviewing literature, future research needs to explore the expert opinion of regulators and Shari'ah advisors as to which practices would be the most suitable for Waqf institutions.
